CONTENTS

Preface	xi
About the Editors	xiii
About the Contributors	xiv
 PART I. GENERAL APPROACHES IN POLITICAL SCIENCE	
1. History of the Discipline <i>Ellen Grigsby, University of New Mexico</i>	3
2. Postmodernism <i>Robert Swan, Western Oregon University</i>	11
3. Neoinstitutionalism <i>Mark C. Miller, Clark University</i>	22
4. Systemism <i>Hyunsun Choi, University of North Florida</i>	29
5. Rationality and Rational Choice <i>Richard A. Wandling, Eastern Illinois University</i>	34
6. Principal-Agent Theory <i>John James Quinn, Truman State University</i>	43
7. Political Psychology <i>David Patrick Houghton, University of Central Florida</i>	51
8. Straussians <i>Scot J. Zentner, California State University, San Bernardino</i>	60
 PART II. COMPARATIVE POLITICS	
9. Systems Theory and Structural Functionalism <i>John R. Fisher, Northwest Missouri State University</i>	71
10. Political Development and Modernization <i>Sarah Wilson Sokhey, The Ohio State University</i>	81
11. Statism <i>Anna Batta, University of North Texas</i>	91
12. Dependency and Development <i>Frank A. Boyd Jr., Illinois Wesleyan University</i>	99

13. Civil Wars	107
<i>M. Israel Stephens, University of North Texas</i>	
14. Terrorism	115
<i>Erik S. Case, University of North Texas</i>	
15. Political and Military Coups	124
<i>Christopher D. Moore, Bethel University</i>	
16. Resource Scarcity and Political Conflict	133
<i>Walter Thomas Casey II, University of Texas at Dallas</i>	
17. Ethnic Conflict	141
<i>Tina Kempin Reuter, Christopher Newport University</i>	
18. Comparative Political Parties: Systems and Organizations	150
<i>Alexandra Cole, California State University, Northridge</i>	
19. Electoral Systems in Comparative Perspective	159
<i>William M. Downs, Georgia State University</i>	
20. Comparative Federalism, Confederalism, Unitary Systems	168
<i>William M. Downs, Georgia State University</i>	
21. Presidentialism Versus Parliamentarism	177
<i>Joseph W. Robbins, Shepherd University</i>	
22. Comparative Judicial Politics	186
<i>David L. Weiden, Indiana University–Purdue University Indianapolis</i>	
23. Civil Society	193
<i>Ryan Salzman, University of North Texas</i>	
24. Political Culture	201
<i>Marc Hooghe, University of Leuven</i>	
25. Religion and Comparative Politics	209
<i>Bryan A. S. Rasmussen, Collin College</i>	
26. Ethnic and Identity Politics	217
<i>Dwight Vick, West Texas A&M University</i>	
<i>John T. Ishiyama, University of North Texas</i>	
27. Social Movements	225
<i>Marc Hooghe, University of Leuven</i>	
28. Gender and Politics	233
<i>Karen J. Vogel, Hamline University</i>	
29. Comparative Environmental Politics and Conflict	242
<i>Amanda M. Rosen, Webster University</i>	
30. Totalitarianism and Authoritarianism	249
<i>Edward Webb, Dickinson College</i>	
31. Semiauthoritarianism	258
<i>Christian Göbel, Lund University</i>	
32. Models of Democracy	267
<i>John T. Ishiyama, Tatyana Kelman, and Anna Pechenina, University of North Texas</i>	
33. Processes of Democratization	275
<i>Eric M. Jepsen, University of South Dakota</i>	
34. Comparative Methods	283
<i>Michelle C. Flores, University of Southern California</i>	
35. Case Studies	293
<i>Catherine L. Johnson, University of North Texas</i>	

PART III. INTERNATIONAL RELATIONS

36. History of International Relations	303
<i>Anthony D. Lott, St. Olaf College</i>	
37. Realism and Neorealism	311
<i>Svetla Ben Itzhak, University of Kansas</i>	
38. Idealism and Liberalism	319
<i>Eric A. Heinze, University of Oklahoma</i> <i>Brandy J. Jolliff, University of Colorado at Boulder</i>	
39. Dependency and World-Systems	327
<i>Gloria C. Walker, Centenary College of Louisiana</i>	
40. Foreign Policy Analysis	336
<i>Baris Kesgin, University of Kansas</i>	
41. Feminist International Relations	344
<i>Karen J. Vogel, Hamline University</i>	
42. Leadership and Decision Making	353
<i>Tobias Van Assche, University of Antwerp</i>	
43. Balance of Power	361
<i>Brian R. King, Muskingum University</i>	
44. Deterrence Theory	368
<i>Seth M. Goldstein, The Ohio State University</i> <i>Brian R. King and Richard Arnold, Muskingum University</i>	
45. Rivalry, Conflict, and Interstate War	376
<i>Eric Cox, Texas Christian University</i>	
46. The Democratic Peace	384
<i>Steven R. Liebel, University of North Texas</i>	
47. Global Politics of Resources and Rentierism	393
<i>Giray Sadik, Gazi University</i>	
48. Complex Interdependence and Globalization	401
<i>Djamel Eddine Laouisset, Canada Consulting Group, Inc.</i>	
49. International Political Economy and Trade	407
<i>Stefan Fritsch, Bowling Green State University</i>	
50. Nonstate Actors in International Relations	414
<i>Michael Kuchinsky, Gardner Webb University</i>	
51. International Organizations and Regimes	422
<i>Byungwon Woo, The Ohio State University</i>	
52. International Law	431
<i>Tina Kempin Reuter, Christopher Newport University</i>	
53. International Environmental Politics	440
<i>Jerald Mast, Carthage College</i>	

PART IV. POLITICAL SCIENCE METHODOLOGY

- | | |
|---|-----|
| 54. Evolution of Science in Political Science | 451 |
| <i>James K. L. Wong, London School of Economics and Political Science</i> | |
| 55. Positivism and Its Critique | 459 |
| <i>William Rose, Albion College</i> | |
| 56. Constructivism | 470 |
| <i>Mariya Y. Omelicheva, University of Kansas</i> | |
| 57. Regression Analysis | 478 |
| <i>Mark Zachary Taylor, Georgia Institute of Technology</i> | |
| 58. Content Analysis | 490 |
| <i>Marijke Breuning, University of North Texas</i> | |
| 59. Longitudinal Analysis | 497 |
| <i>Shane Nordyke, University of South Dakota</i> | |
| 60. Qualitative Versus Quantitative Research | 506 |
| <i>Alicia Jencik, University of New Orleans</i> | |
| 61. Survey Research | 514 |
| <i>H. Whitt Kilburn, Grand Valley State University</i> | |
| 62. Experiments | 523 |
| <i>Elizabeth A. Bennion, Indiana University South Bend</i> | |
| 63. Formal Theory and Spatial Modeling | 532 |
| <i>Donald M. Gooch, Arkansas Tech University</i> | |
| 64. Game Theory | 541 |
| <i>Byungwon Woo, The Ohio State University</i> | |

PART V. POLITICAL THOUGHT

- | | |
|--|-----|
| 65. The Ancients | 553 |
| <i>Steve G. Hartlaub, Frostburg State University</i> | |
| 66. Asian Political Thought | 560 |
| <i>Timothy J. Lomperis, Saint Louis University</i> | |
| 67. Islamic Political Thought | 568 |
| <i>Svetla Ben Itzhak, University of Kansas</i> | |
| 68. Christian Political Thought | 577 |
| <i>Michelle D. Deardorff, Jackson State University</i> | |
| 69. Early Moderns and Classical Liberals | 587 |
| <i>David Schultz, Hamline University</i> | |
| 70. Neoclassical Liberals | 596 |
| <i>Ellen Grigsby, University of New Mexico</i> | |

71. Modern Democratic Thought	605
<i>Jeffrey D. Hilmer, University of British Columbia</i>	
72. Modern Liberalism, Conservatism, and Libertarianism	615
<i>Johnny Goldfinger, Marian University</i>	
73. Anarchism	625
<i>Leonard Williams, Manchester College</i>	
74. Nationalism	633
<i>Salih Bicakci, Isik University</i>	
75. Fascism and National Socialism	639
<i>Gerald L. McCallister, University of North Texas</i>	
76. Marxism	648
<i>Michael D'Amore, Sussex County Community College</i>	
<i>John T. Ishiyama, University of North Texas</i>	
77. Revisionism and Social Democracy	655
<i>Jutta A. Helm, Western Illinois University</i>	
78. Leninism, Communism, Stalinism, and Maoism	664
<i>Anna N. Makhova Gregg, Austin Peay State University</i>	
79. Socialism in the Developing World	673
<i>Lilly Kelan Lu, University of North Texas</i>	

PART VI. AMERICAN POLITICS

80. Founding of the American Political System	685
<i>Richard J. Hardy, Western Illinois University</i>	
81. Urban Politics	699
<i>June Sager Speakman, Roger Williams University</i>	
82. Media and Politics	708
<i>Bas W. van Doorn, The College of Wooster</i>	
83. U.S. Congress	717
<i>Tom Miles, University of North Texas</i>	
84. The Presidency	725
<i>Rebecca E. Deen, University of Texas at Arlington</i>	
85. American Judicial Politics	735
<i>Shannon Ishiyama Smithey, Westminster College</i>	
86. American Bureaucracy	743
<i>William J. Miller, Southeast Missouri State University</i>	
<i>Julia Beckett, The University of Akron</i>	
87. Interest Groups and Pluralism	752
<i>Stephen Sussman, Barry University</i>	
88. American Federalism	760
<i>Brian P. Janiske, California State University, San Bernardino</i>	
89. American Political Parties	769
<i>Jeffrey Kraus, Wagner College</i>	
90. State and Local Government	779
<i>June Sager Speakman, Roger Williams University</i>	
91. Public Policy and Administration	786
<i>Candace C. Young, Truman State University</i>	
92. Campaigns	796
<i>Chapman Rackaway, Fort Hays State University</i>	
93. Political Socialization	805
<i>Vanessa P. Bouché, The Ohio State University</i>	

94. Voting Behavior	813
<i>C. J. Williams, University of North Texas</i>	
95. American Foreign Policy	822
<i>Jeremy R. Backstrom, University of North Texas</i>	
96. Race, Ethnicity, and Politics	831
<i>Anthony DeForest Molina, University of South Dakota</i>	
97. Gender and Politics in the United States	840
<i>Angela L. Bos, College of Wooster</i>	
<i>Paula L. O'Loughlin, University of Minnesota, Morris</i>	
98. Religion and Politics in America	847
<i>Bryan A. S. Rasmussen, Collin College</i>	
99. LGBT Issues and the Queer Approach	856
<i>Robert Kulpa, Birkbeck College</i>	
Index	865

PREFACE

These two volumes of *21st Century Political Science: A Reference Handbook* were the product of many discussions that we, the editors, have had over the years concerning how to make fairly complex approaches in political science accessible to advanced undergraduate students and beginning graduate students. There is very little in the way of reference works in political science that are sufficiently accessible that undergraduate students can profitably use them to assist the pursuit of their research interests. In particular, we have sought to produce a single work that would provide students with the essentials of various approaches (both theoretical and methodological) in political science. Needless to say, our focus on essentials has meant covering fairly broad areas in the discipline, rather than specific topics. In our view, this broad focus would be most useful to undergraduate students.

In consultation with our editorial advisory board, made up of a number of eminent scholars from a variety of different subfields (who are also award-winning teachers), we selected 99 of the most important general topics in the discipline. Via these 99 entries or chapters, the SAGE 21st Century Reference Series volumes on political science highlight the most important topics, issues, questions, and debates that any student obtaining a degree in this field ought to have mastered for effectiveness in the 21st century. The purpose is to provide undergraduate majors in political science with an authoritative reference source that will serve their research needs with far more detailed information than short encyclopedia entries but not so much jargon, detail, or density as a journal article or a research handbook chapter.

To accomplish these goals, the two volumes are divided into six major parts: (I) General Approaches in Political Science, (II) Comparative Politics, (III) International Relations, (IV) Political Science Methodology, (V) Political Thought, and (VI) American Politics. In Part I, we cover the history of the discipline (e.g., the behavioral revolution, the rise of neoinstitutionalism, and the postbehavioral critique), as well as several general approaches in political science (such as rational choice, political psychology, and principal-agent theory).

Part II, on comparative politics, focuses on topics related to political development (such as modernization theory, dependency and development, statism), political violence (e.g., coups, civil wars, terrorism, ethnic conflict), political institutions (the effects of electoral laws, presidentialism, federalism, comparative judicial politics), political culture and civil society (religion and comparative politics, ethnic identity), and comparative methods (case studies, most-similar and most-different systems approaches).

Part III deals with essential approaches in international relations, including chapters on realism and neorealism, liberalism, world-systems analysis, and foreign policy analysis. There are also chapters on international conflict and war (e.g., on the balance of power, rivalry and interstate war, and the democratic peace), international political economy (e.g., complex interdependence, trade, and resource scarcity and rentierism), and global governance (international organizations and regimes and international law).

Political science methodology is covered by Part IV. We begin with chapters on the philosophy of science (including empirical approaches, positivism and its critique, and constructivism), followed by chapters that illustrate commonly used quantitative and qualitative techniques (such as regression analysis, survey research methods, experimentation, and content analysis) and then by chapters on game theory and formal modeling approaches in political science. These chapters in particular are meant to be easily understandable to students who are just beginning to engage in political science research.

Part V includes chapters on political thought, not only Western political thought but from elsewhere in the world as well. We made a conscious effort to include chapters not only on the Western classics (the “ancients,” enlightenment thinkers, neoclassical liberalism, socialism, anarchism, etc.), but also on Asian political thought, Islamic political thought, and Christian political thought. Thus students will have exposure to points of view that are not entirely rooted in the Western experience. The ability to view fundamental political issues from different points of view is, we believe, an essential skill students must have for the 21st century.

Finally, in Part VI, we cover American politics. We include chapters on the political structures and institutions of the United States (including chapters that cover research on Congress, the presidency, the bureaucracy, federalism, state and local politics, and the media) and political behavior (including public opinion and voting behavior, as well as policy making and administration). Furthermore, we have included a section on an increasingly important area in the study of American politics (which we believe will only grow in importance in the 21st century): identity politics. There are chapters that cover topics such as race, ethnicity, and politics; gender and politics; religion and politics; and LGBT issues and queer theory.

We would like to thank our families, particularly our daughters, Fasika and Bedelwa Ishiyama, and John's son, David Ishiyama, for their constant support and patience

with Mom and Dad as we finished this project (seemingly permanently tethered to our computers). We would like to thank our editorial advisory board, Larry Baum, Janet Box-Steffensmeier, Michelle Deardorff, Kerstin Hamann, and Pat James, for their wonderful suggestions regarding the topics covered by these volumes and for their constant support and encouragement as we undertook this massive project. We would also like to thank Sanford Robinson, Jim Brace-Thompson, Laura Notton, and Yvette Pollastrini at SAGE for their professionalism, their invaluable assistance, and their patience with us as we struggled through the process. All were incredibly helpful, but we would especially like to single out Sanford as he was an invaluable ally in helping to "bring the herd in." We cannot thank you all enough.

John T. Ishiyama and Marijke Breuning

ABOUT THE EDITORS

John T. Ishiyama (PhD, Michigan State University) is professor of political science at the University of North Texas. His teaching interests include comparative political development, democratization and political parties, and political methodology. His research interests include democratization and political parties in post-Communist Russian, European, Eurasian, and African (especially Ethiopian) politics; ethnic conflict and ethnic politics; and the scholarship of teaching and learning. He is the author or editor of four books and author or coauthor of more than 100 journal articles (in such journals as the *American Political Science Review*, *Perspectives on Politics*, *PS: Political Science and Politics*, *Comparative Political Studies*, *Comparative Politics*, *Political Science Quarterly*, *Political Research Quarterly*, *Social Science Quarterly*, *Europe Asia Studies*, *Party Politics*, and others) and book chapters on democratization, party politics, ethnic politics, and post-Communist Russian, European, and African politics. He has also written widely on curriculum development, educational opportunity, and educational assessment in political science. In addition, he is a research fellow at the University of Kansas's Center for Russian and East European Studies. Currently, he serves as editor-in-chief (and was founding editor) of the *Journal of Political Science Education*, the journal of the American Political Science Association (APSA) Political Science Education (formerly the Undergraduate Education) section.

He was also a member of the APSA Executive Council (2007–2009). He is currently an executive board member of the Midwest Political Science Association (2010–2013) and a member of the executive board of Pi Sigma Alpha (the national political science honorary society) from 2008 to 2012.

Marijke Breuning (PhD, The Ohio State University) is professor of political science at the University of North Texas. Her teaching interests include international relations, comparative foreign policy, international organization, and European politics. Her research interests include comparative foreign policy, foreign aid and development cooperation, and ethnic politics. She is a member of the International Studies Association (ISA), the American Political Science Association (APSA), the International Society of Political Psychology, and the European Union Studies Association. She has served on the executive committees and is past president of the APSA Foreign Policy Division, the ISA Midwest region, and the ISA Foreign Policy Analysis section. She has published articles in, among other journals, *American Political Science Review*, *International Studies Quarterly*, *Comparative Political Studies*, and *International Politics* and has coauthored a book with John Ishiyama. Together with Dr. Ishiyama, she edits the *Journal of Political Science Education*. She was part of the original ISA editorial team of *Foreign Policy Analysis*.

ABOUT THE CONTRIBUTORS

Richard Arnold is assistant professor of political science at Muskingum University, where he teaches comparative politics and international relations. He received his BA in 2003 from York University in the United Kingdom. In 2009, he graduated from The Ohio State University with a doctorate in political science, with a focus on ethnic conflict in comparative perspective. His research interests include ethnic conflict, neo-Nazi movements, nationalism, racism, anti-Semitism, qualitative methodologies, and issues in political theory.

Jeremy R. Backstrom is a doctoral student of comparative politics, international relations, and political science at the University of North Texas. His research interests include ethnic politics, civil wars, and international relations.

Anna Batta is a PhD student at the University of North Texas focusing on comparative politics, international relations, post-Communism, and the Middle East.

Julia Beckett is an associate professor of public administration at The University of Akron. She earned a JD from Washington University in St. Louis and a PhD in public administration from the University of Colorado at Denver. Her research interests are the Hoover Commission reforms, public law, public budgeting, and emergency management.

Svetla Ben-Itzhak is a PhD student in political science at the University of Kansas. She holds an MA in political science with a certificate in international service from Kansas State University. Her research interests include international relations, foreign policy, and political economy, with a special research focus on the role of foreign aid in promoting development, abating poverty, and mitigating conflict in the Middle East and Africa.

Elizabeth A. Bennion is associate professor of political science at Indiana University South Bend. She received her BA in American studies from Smith College and her MA and PhD in political science from the University of Wisconsin–Madison. Bennion uses randomized field experiments to test the effectiveness of voter registration and mobilization techniques. She has also published work

in the areas of gender politics and the scholarship of teaching and learning.

Salih Bicakci is an assistant professor in the department of International Relations of Isik University, Istanbul, Turkey. He received his BA from the Department of History at Marmara University in 1994 and his MA from the Turkic and Turkish Studies Institute of Marmara University. He teaches courses on the Middle East in international politics (with a focus on the Israeli-Palestinian conflict, Lebanon, and Iran), theory of international relations, and Turkish foreign policy. He has field experience in Israel, Palestine, and Central Asia and has published articles on security, nationalism, and international politics. Recently he has focused on security issues of the Middle East and Central Asia, including terrorism and cyberwars.

Angela L. Bos is assistant professor of political science at the College of Wooster. She received her BA from the University of Minnesota–Morris and her MA and PhD from the University of Minnesota–Twin Cities. Her research interests are gender and racial stereotypes, political nominations and elections, civic engagement and civic education, and pedagogy in political science.

Vanessa P. Bouché is a PhD candidate at The Ohio State University. She received her master's in public policy from the Lyndon B. Johnson School of Public Affairs at the University of Texas and her BA from Columbia University. Her dissertation is on the identity mechanisms of political engagement, with significant emphasis on identity-centered socialization into the affective, cognitive, and behavioral components of political attitudes. Her research and teaching interests include American politics, identity politics, political psychology, public opinion, and American foreign policy.

Frank A. Boyd Jr. is associate provost and associate professor of political science at Illinois Wesleyan University. His research interests include the political economy of development and the political economy of common pool resources.

Erik S. Case is a graduate student at the University of North Texas at Denton. He currently holds an MS in political science and is pursuing an MS in economic research. He received his bachelor's degree in political science from St. Edwards University at Austin in 2005, and his work as a counterterrorism analyst for the Texas Department of Public Safety led him to focus on terrorism-related issues during his graduate studies.

Walter Thomas Casey II is a research associate–postdoctoral fellow in electoral behavior research at the School of Economic, Political and Policy Sciences at the University of Texas at Dallas. His work focuses on the intersection of gender and political violence, the results of harmful tax competition, and modern praetorianist problems in developed democracies.

Hyunsun Choi is assistant professor in the Department of Political Science and Public Administration at the University of North Florida. He specializes in community development and urban planning related to regional governance, smart growth, housing, faith initiatives, minority communities, and public policy and, as minor fields, comparative and international development and geographic information systems. He received his PhD and a master's degree in planning from the University of Southern California, Los Angeles, and his BA and MA in public administration from Yonsei University, Seoul, South Korea. He has published peer-reviewed articles, book chapters, and professional reports and has presented a number of papers at national and international academic conferences.

Alexandra Cole is an associate professor of political science at California State University, Northridge. She received her PhD from the University of California at Irvine, and her interests include political parties and party systems. She has written about parties of the far right in Europe and most recently about changes in the German political party system.

Eric Cox received his BA from Austin College in Sherman, Texas, in 1997 and his MA (2000) and PhD (2006) from the University of Virginia in Charlottesville. He is currently an assistant professor at Texas Christian University. His research interests include the resolution of enduring rivalries, diplomacy at the United Nations, and domestic influences on the foreign policy of states.

Michael D'Amore is an Assistant Professor of Political Science and History at Sussex County Community College. He received his BA in Political Science from Moravian College in 1992, his MA in Political Science from the University of Vermont in 1998, and his PhD in Political Science from the University of Massachusetts Amherst in 2009. His dissertation was titled “The Influence of American Exceptionalist Thought on the Role of the United States in the Contemporary War on Terrorism.”

Michelle D. Deardorff is associate professor in the Department of Political Science at Jackson State

University in Jackson, Mississippi. Since earning her PhD from Miami University in 1993, her teaching and research have focused on the constitutional protections surrounding gender, race, and religion, as well as on political theory. Prior to her relocation to Jackson State in 2003, she was the Griswold Distinguished Professor of Political Science at Millikin University in Decatur, Illinois. In 2009, *Assessment in Political Science*, a primer on programmatic and classroom assessment within the discipline, which she coedited with Kerstin Hamann and John Ishiyama, was published. The two-volume set *Constitutional Law in Contemporary America*, which she coauthored with David Schultz and John R. Vile, is being published in 2010. She has been teaching political philosophy at the graduate and undergraduate levels since 2004.

Rebecca E. Deen earned her doctorate in political science from The Ohio State University in 1997. She is an associate professor of political science at the University of Texas at Arlington and chair of the Department of Political Science. Her publication and research fields include the American presidency and pedagogies in political science. She has published articles in *Congress & The Presidency*, *Presidential Studies Quarterly*, *Judicature*, *PS: Political Science & Politics*, and *Spectrum: The Journal of State Government*. The George Bush Presidential Library Foundation and the Gerald R. Ford Foundation have supported her work with travel grants. She serves as a reviewer for many scholarly journals and publishers.

William M. Downs (PhD, Emory University) is chair of the Department of Political Science at Georgia State University and codirector of the Center for Human Rights and Democracy. His research and teaching interests are in the field of comparative politics, with a specific regional focus on Europe and the member states of the European Union. He has particular research foci on parties in legislatures, federalist remedies to regional nationalism, coalition behavior, and extremist political parties. He is the author of *Coalition Government, Subnational Style: Multiparty Politics in Europe's Regional Parliaments*, which investigates the machinations of postelection alliance building in the subnational legislatures of Germany, France, and Belgium. He is editor of as well as contributor to “Regionalism in the European Union,” a special issue of *The Journal of European Integration*, and has published research articles on political parties in a long list of scholarly journals. He is coeditor of *e Extreme*, a newsletter of the European Consortium of Political Research's Standing Group on Extremism and Democracy.

John R. Fisher is an assistant professor of communications at Northwest Missouri State University in Maryville, Missouri. He received his PhD from the University of Alberta (Canada), where he studied the impact of mass communication on political decision making. His current research interests include crisis communication and media bias.

Michelle C. Flores is a PhD candidate in the Department of Political Science at the University of Southern California and a visiting instructor at the University of Northern Iowa. Her dissertation analyzes institutional change in Lebanon's state-recognized religious institutions.

Stefan Fritsch is an assistant professor of political science at Bowling Green State University. His research focuses on global political economy, technology and global affairs, multinational corporations, and European integration. Recent publications have appeared in *Global Society*, *Review of International Political Economy*, and *International Studies Perspectives*. His current research focuses on fair trade, multinational corporations, and technological evolution and the global governance of technological standards.

Christian Göbel is research fellow at the Centre for East and South-East Asian Studies at Lund University. He received his PhD from the University of Duisburg-Essen. Göbel is the author of *The Politics of Rural Reform in China: State Policy and Village Predicament in the Early 2000s* and is currently leading a research project on the consolidation of authoritarian regimes. His research interests include the change and persistence of democratic and authoritarian systems, central-local relations and governance in China's multitiered administration, and the comparative study of corruption.

Johnny Goldfinger is an assistant professor of political science at Marian University. His research interests include deliberative democracy, political engagement, and social choice theory. He teaches courses on the history of political theory and democratic decision making.

Seth M. Goldstein is a PhD candidate in political science at The Ohio State University, where he specializes in international security, political psychology, and foreign policy. He received his BA in 2003 from the University of Rochester. His research interests include signaling and perception in coercive diplomacy, the effects of domestic politics and leaders on foreign policy credibility, the psychology of threat perception in the post-September 11 era, the effect of group ideologies on risk taking in foreign policy decision making, and contemporary issues in American political life.

Donald M. Gooch is an assistant professor of political science in the Department of History and Political Science at Arkansas Tech University. He earned his PhD in political science from the University of Missouri, Columbia, in 2009. Dr. Gooch is an expert in American politics and public policy. His current research agenda involves studying trends in political polarization in the American electorate and developing empirical tests of formal voting models consistent with theoretical expectations.

Ellen Grigsby (PhD, University of North Carolina, 1987) teaches political theory at the University of New Mexico. She is the author of *Analyzing Politics* (4th ed.).

Richard J. Hardy is professor and chair of the Department of Political Science at Western Illinois University. He earned his BA from Western Illinois University, MA from the University of North Dakota, and PhD from the University of Iowa. He has served on the faculties of Northern State University, Duke University, and the University of Missouri-Columbia and has taught courses in American politics, constitutional law, civil rights, the Supreme Court, federalism, state government, policy evaluation methods, and civic leadership. He has received more than 50 significant teaching and civic leadership awards, has conducted nearly 100 workshops on constitutional law, was a member of the Electoral College, and has served as a political analyst for numerous media outlets. He has published or edited seven books, including *Government in America* and *Civic Education*, and his articles have appeared in the *American Journal of Political Science*, *Law and Policy Quarterly*, and *Publius*.

Steve G. Hartlaub completed his PhD at Michigan State University and has taught at Frostburg State University for the past 15 years. He has taught a number of honors seminars relating aspects of ancient political philosophy to modern society, including seminars on education, the regulation of sexuality, the use of rhetoric, and the understanding of tyranny. He has published a number of articles on teaching in political science and presented conference papers relating Aristotle's best regime to new urbanism, and reading Machiavelli's *Prince* from the perspective of Aristotle's teaching on tyranny.

Eric A. Heinze is assistant professor of political science and international studies at the University of Oklahoma. He holds a PhD in political science from the University of Nebraska, where he studied international relations and political theory. His current and recent research is on humanitarian intervention, liberal international theory, global governance, nonstate actors in armed conflict, and the legal and ethical implications of the war on terrorism. He is the author of *Waging Humanitarian War: The Ethics, Law and Politics of Humanitarian Intervention* (and coeditor of *Ethics, Authority and War: Non State Actors and the Just War Tradition*).

Jutta A. Helm earned her PhD at the University of North Carolina. She is currently professor emerita of political science at Western Illinois University. Her teaching interests include European politics, German politics, and the comparative study of genocide. Most of her publications focus on political participation, broadly defined: new social movements, workplace democracy, and the role of trade unions in hard times.

Jeffrey D. Hilmer is a postdoctoral teaching fellow at the University of British Columbia, Vancouver. He received his PhD in political science, with an emphasis on democratic theory, from the University at Albany, State University of New York, in 2007. His current research interests include differentiating participatory and deliberative theories of

democracy, exploring participatory democratic institutions in Brazil, theorizing agonistic democratic institutions, and contrasting old and new theories of pluralism.

Marc Hooghe is a professor of political science at the University of Leuven (Belgium). He obtained his PhD in political science in 1997 from the University of Brussels (Belgium), with a dissertation on the political impact of new social movements. His work focuses mainly on political participation, social movements, and social capital, and it has appeared in various scientific journals, such as the *European Journal for Political Research*, *Political Behavior*, and *Comparative Political Studies*. At Leuven University, he is head of the Centre for Political Science Research.

David Patrick Houghton is an associate professor of political science at the University of Central Florida. His published books include *U.S. Foreign Policy and the Iran Hostage Crisis* and *Political Psychology: Situations, Individuals, and Cases*. His latest book, *The Decision Point*, is due to be published in 2011. His area of expertise is political psychology and decision making in international relations, and he has published refereed articles in a variety of top journals. He received his PhD in political science in 1996 from the University of Pittsburgh and has also taught there and at the University of Essex. From 2001 to 2002, he was a visiting scholar at the Mershon Center for International Security Studies at The Ohio State University.

Brian P. Janiskee is professor of political science and department chair at California State University, San Bernardino. He received his PhD from Michigan State University. Janiskee is coauthor of *Democracy in California* (2008), coeditor of *The California Republic* (2003), and author of numerous articles in such areas as crime policy, local government, and presidential elections. His current research interests include local government in the American colonial period, research methodology, and national security policy.

Alicia Jencik is a PhD candidate in the department of political science at the University of New Orleans. She specializes in political behavior, gender politics, and political institutions. Her dissertation examines how women and men are affected differently by natural disasters and uses the city of New Orleans before and after Hurricane Katrina as a case study. She obtained her BA, MA, and a certificate in women's studies at Florida Atlantic University. She is the author of *A Woman in the White House? The Effects of Gender on Female Politicians*, as well as "Survey Research in Post Katrina New Orleans: 'I Can't Imagine It,'" with Susan Howell. She worked with the University of New Orleans Survey Research Center from 2005 through 2008, conducting research on quality of life and recovery issues in post-Hurricane Katrina New Orleans. She has focused on survey research methodology and has taught research methods courses to undergraduate students.

Eric M. Jepsen is an assistant professor at the University of South Dakota. His teaching and research interests include political economy, democratization, globalization, Latin American politics, and South Asian politics. His research on subnational economic development and democracy in India and Mexico has been funded by the National Science Foundation and the Social Science Research Council and has appeared in a number of books and journals.

Catherine L. Johnson is a PhD candidate and teaching fellow in the Department of Political Science at the University of North Texas. She earned an MPA from the University of North Texas in 2003. Her dissertation topic involves the influences of military service on political attitudes, voting, and participation.

Brandy J. Joliff is a PhD student in political science at the University of Colorado, where she is studying comparative politics and international relations. She holds an MA in international studies from the University of Oklahoma. Her current work deals with comparative European foreign policy, European integration, and democracy promotion to third world countries in European Union foreign policy.

Tatyana Kelman is a graduate student in the PhD program in political science at the University of North Texas.

Baris Kesgin is a PhD candidate in political science at the University of Kansas. His work (with Juliet Kaarbo) has appeared in *International Studies Perspectives*. Presently, his research concentrates on tracing leadership effects in Israel's and Turkey's relations with the United States.

H. Whitt Kilburn is assistant professor of political science at Grand Valley State University. He received his PhD from the University of North Carolina at Chapel Hill in 2005. His research interests center on the study of mass public opinion, elections, and voting behavior.

Brian R. King is assistant professor of political science at Muskingum University. He received his BA in 1992 from Ohio Northern University and his PhD in 2005 from the University of Cincinnati, where he studied both American politics and international relations. His research interests include presidential management and policy, organizational learning in government, American political institutions, international security issues, international crisis decision making and management, and issues related to American foreign policy and national security.

Jeffrey Kraus is associate provost and professor of government and politics at Wagner College, where he has been a member of the faculty since 1988. Prior to coming to Wagner, he taught at Kingsborough Community College (1980–1987) and Baruch College (1987–1988). His research has focused on political parties, elections, and campaign finance. He has also been a consultant to a number of political campaigns in New York and since 2001 has chaired the New York City Voter Assistance Commission.

Michael Kuchinsky is an assistant professor of political science at Gardner-Webb University (North Carolina), where he teaches international relations, comparative politics, political economy and development studies, and other courses in global politics. Before college teaching, he served as a program associate and executive in several public policy nongovernmental organizations, as well as being an ordained clergyman.

Robert Kulpa is a PhD candidate at Birkbeck College, London, United Kingdom. His research focus is on the formation of gay identities and their interwoven connections with a national identity in post-Communist Poland. He has an interest in a comparative study of Western and Central European lesbian, gay, bisexual, and transgender movements, queer theories, nationalism, and links between power and knowledge. He teaches politics at University College London and has published in a number of scholarly journals.

Djamel Eddine Laouiset earned his PhD in 1983 from the University of Miami (Florida). He is CEO of Canada Consulting Group in Ottawa and was director of studies and research at the National Institute for Global Strategic Studies in Algiers, Algeria, from 1987 to 1990. He is also a former member of the National Research Council in Algiers and advised the minister of economy and commerce of the United Arab Emirates from 2001 to 2004. He is a fellow of the Salzburg Seminar (Austria) and a Gerson Lehrman Group council member. He has published several books, papers, and articles in his fields of expertise and has spoken at various international academic and professional forums. He is a founding and active member of a number of international academic and professional societies.

Steven R. Liebel is a PhD candidate in international relations and political science at the University of North Texas. His research interests include conflict management and processes, and human rights.

Timothy J. Lomperis is professor of political science at Saint Louis University in Missouri. He grew up in India as the son of missionaries. He received his PhD from Duke University and has taught at Louisiana State University, Duke University, the U.S. Military Academy at West Point, and Saint Louis University. He has published four major books, *The Hindu Influence on Greek Philosophy* (1984) and three books on the Vietnam War: *The War Everyone Lost—and Won* (1984, 1986, and rev. ed., 1993), *Reading the Wind* (1987), and *From People's War to People's Rule* (1996). He has published numerous articles on Vietnam and on the War on Terror. His current research interests are Asian political thought and the foreign policy of comparative military interventions.

Anthony D. Lott is an associate professor of political science at St. Olaf College in Northfield, Minnesota. He earned his PhD in international studies in 2002 from the Graduate School of International Studies at the University of Denver. His research interests include developments in

international relations theory, the history of international law and cooperation, and challenges to international security. He is the author of *Creating Insecurity: Realism, Constructivism and U.S. Security Policy* and numerous articles on international relations theory and international law.

Lilly Kelan Lu is a PhD student at the University of North Texas. She received her BA in law in 2005 from Qingdao University, and in 2007 she completed a master's degree in international affairs and administration at Missouri State University. Her research interests include comparative politics and economy, as well as the application of quantitative methodology.

Anna N. Makhova-Gregg is an assistant professor of political science at Austin Peay State University, Clarksville, Tennessee. She received her PhD from Southern Illinois University, Carbondale (2008). Her current research interests include Russian and post-Soviet politics, Chinese politics, bureaucracy in post-Communist states, and the political economy of transition to capitalism.

Jerald Mast has a bachelor's degree in political science from the University of Wisconsin–Madison and a PhD in political science from Northern Arizona University. He has conducted research on economic valuation of environmental aesthetics, environmental security, and natural resource policy on the Great Lakes. He is the chair of the political science department at Carthage College.

Gerald L. McCallister is a PhD student of political science at the University of North Texas. He received his MA in 2006 from the University of Texas at Arlington. His research interests include China–Taiwan relations, international conflict, international trade, the former Soviet Union, Mexican politics, diplomacy, terrorist groups, and U.S. foreign policy.

Tom Miles is a PhD student at the University of North Texas and holds a master's degree in political science from Texas State University. He specializes in American politics and has done extensive research on the interactions between Congress and the president. His research, with Matthew Eshbaugh-Soha (University of North Texas), on the congressional agenda setting of President George W. Bush, has been published in *American Review of Politics*.

Mark C. Miller is a professor of American government and director of the Law and Society Program at Clark University in Worcester, Massachusetts. He received his PhD from The Ohio State University and his JD from The George Washington University. He is the author of *The High Priests of American Politics: The Role of Lawyers in American Political Institutions* (1995), coeditor of *Making Policy, Making Law: An Interbranch Perspective* (2004), editor of *Exploring Judicial Politics* (2008), and author of *The View of the Courts From the Hill: Interactions Between Congress and the Federal Judiciary* (2009). His current research interests include the interactions between legislatures and courts in the United States and abroad, as well as the role of lawyers in American political institutions.

William J. Miller is an assistant professor of political science at Southeast Missouri State University. He earned his PhD in public administration and urban studies at The University of Akron. His research focuses on comparative public opinion regarding various public policies, the pedagogy of political science, and public perceptions of bureaucracy.

Anthony DeForest Molina, PhD, is director of the Master of Science in Administration program and assistant professor in the Department of Political Science at the University of South Dakota. He earned his doctorate in urban studies and public affairs at Cleveland State University, where he taught courses in urban theory, American government, and urban politics and the African American experience. His current teaching and research interests include public administration ethics, organization theory, and the role of values in administrative decision making.

Christopher D. Moore is an assistant professor of political science at Bethel University, St. Paul, Minnesota. He received his PhD from The Ohio State University in 2008. His research interests include foreign policy decision making, political psychology, and nonstate political violence, including terrorism and insurgency.

Shane Nordyke is assistant professor of political science at the University of South Dakota. She received her PhD in public policy from Indiana University in 2008. Her research interests include a variety of public policy problems but focus on those related to homeland security, terrorism, aviation security, aviation safety, and intergovernmental relations. Most recently she has completed a longitudinal analysis of spending by the Department of Homeland Security at the state level from 2002 to 2007. Currently she enjoys teaching courses in public policy, policy analysis, and research methods to students in undergraduate, MPA, and PhD programs.

Paula L. O'Loughlin is professor of political science at the University of Minnesota–Morris. She received her BA from Smith College and completed her PhD at the University of Minnesota–Twin Cities. Her research interests include gender and politics, civic education, political behavior, media, and political psychology.

Mariya Y. Omelicheva is an assistant professor of political science at the University of Kansas. She holds a PhD (2007) in political science from Purdue University and a JD in international law (2000) from Moscow's National Law Academy. Her research and teaching interests include international and Eurasian security, counterterrorism and human rights, and Russia's foreign policy. She has also published on the issues of students' assessment and application of various research techniques to the analysis of learning outcomes.

Anna Pechenina is a graduate student in the PhD program in political science at the University of North Texas.

John James Quinn is a professor of political science at Truman State University, where he teaches classes on comparative politics, African politics, international relations, international political economy, and methodology. His recent publications have centered on divergent aspects of the political economy of African development, African foreign policy, African political parties, corruption and its tie to majority state ownership, and the links between the Rwandan genocide and the later disorder in Zaire (Democratic Republic of the Congo). He is author of *The Road Oft Traveled: Development Policies and Majority State Ownership of Industry in Africa* (2002).

Chapman Rackaway is associate professor of political science, Fort Hays State University. He received his PhD from the University of Missouri in 2002. His specialty is in the area of campaign processes and political organizations, specifically the intersection of political parties and their affiliated campaigns at the state and local levels. His work has been featured in *Politicking Online* (2009, Rutgers University Press) and in the *Social Science Computer Review*.

Bryan A. S. Rasmussen is a professor of political science at Collin College in Frisco, Texas. He received his MA from the University of Nevada, Las Vegas. He has continued his graduate work and his study of religion and politics at the University of North Texas in Denton. He has a passion for teaching undergraduates the importance of their government.

Tina Kempin Reuter, PhD, is assistant professor of international and comparative politics at Christopher Newport University, Newport News, Virginia, and director of the program in international conflict management. She received her MA (2002) in contemporary history, economics, and international law and her PhD (2006) in international law and international relations, both with distinction, from the University of Zurich in Switzerland. She was a visiting researcher at the Solomon Asch Center for Study of Ethnopolitical Conflict at the University of Pennsylvania (2005–2006), a research fellow at the Institute of Public International Law at the University of Zurich Law School (2003–2005), and a research assistant at the Center for Security Studies and Conflict Research at the Swiss Federal Institute of Technology (1999–2002). She is the author of *Ethnic Conflict and International Law: Group Claims and Conflict Resolution Within the International Legal System* (forthcoming) and *Ready for Peace? The Implementation of the Good Friday Agreement in Northern Ireland, 1998–2002* (2003). She has also published various articles on ethnic conflict, human rights, and minority issues.

Joseph W. Robbins is currently an assistant professor in the Department of Political Science at Shepherd University. He received his PhD from the Department of Political Science at Texas Tech University in 2008. His

work has focused on fiscal policy making, political institutions, and the development of political party systems in former Communist countries. His work has appeared in a number of journals, including *Comparative Politics*, *Party Politics*, and *Europe Asia Studies*.

William Rose is associate professor and chair of the Department of Political Science at Albion College in Michigan. He holds a JD from the University of Toledo and a PhD in political science from the University of Massachusetts–Amherst. His scholarly and teaching interests lie in the areas of contemporary legal and political theory, the history of American legal and political thought, and jurisprudence.

Amanda M. Rosen is an assistant professor of politics and international relations at Webster University. She earned a bachelor's degree from Duke University in political and economic studies of Europe and a master's degree and PhD (2009) in political science from The Ohio State University, where her dissertation was titled *Emission Impossible? The Impact of the International Climate Regime on Sub National Climate Change Policymaking*. In addition to climate change policy making, she is interested in American foreign policy, international security, and American political behavior. She has received several grants for her research, including a grant from the Mereson Center for International Security Studies, and has presented papers at the Midwest Political Science Association and the Joint Sessions of the European Consortium for Political Research.

Giray Sadik earned his PhD (2008) in political science from the University of Georgia, specializing in international relations and comparative politics. His research interests encompass the interaction of domestic politics and foreign policy, focusing on areas such as American foreign policy and comparative Middle Eastern political systems. He was recently a visiting assistant professor of political science at Truman State University, teaching courses on American foreign policy and international security, and is now in the Department of International Relations at Gazi University, in Ankara, Turkey.

Ryan Salzman is a PhD candidate studying political science at the University of North Texas, Denton. His research interests include the comparative politics of political culture in developing countries. He is currently studying the effects of media consumption on democratic norms and behavior in the Latin American region.

David Schultz is professor in the School of Business at Hamline University in St. Paul, Minnesota. He is the author or editor of more than 25 books and 70 articles on various aspects of political theory, law, and American politics, including *Inventors of Ideas: An Introduction to Western Political Philosophy*.

Shannon Ishiyama Smithey is associate professor in the Department of Political Science and Sociology at Westminster College in New Wilmington, Pennsylvania. She received her PhD in political science from The Ohio State University in 1994. Her research focuses primarily on courts in countries making transitions to democracy, with particular emphasis on judicial interpretation of electoral rights, civil liberties, and court powers.

Sarah Wilson Sokhey is a PhD candidate in the Department of Political Science at The Ohio State University. In the fall of 2010, she will be an assistant professor at the University of Colorado, Boulder. Her research interests focus on comparative political economy, economic development, interest group politics, business–state relations, and the post-Communist countries of Eastern Europe, Russia, and Central Asia.

June Sager Speakman, PhD, is professor of political science at Roger Williams University in Bristol, Rhode Island, where she teaches American politics and public administration. She has a PhD in political science from City University of New York and an MA in economics from the New School for Social Research. She has done research on politics and public policy at the municipal level and is currently serving her third term of office on her local town council.

M. Israel Stephens has a MPSA from The Bush School at Texas A&M University and currently is a PhD (ABD) student at the University of North Texas. His research interests include international politics at the systemic level and conflict, broadly defined. He should finish his dissertation in 2011 and will look to continue in the ranks of academia.

Stephen Sussman is an assistant professor of public administration and academic coordinator at Barry University's School of Adult and Continuing Education, where he teaches in the MPA and BPA programs. He earned his MPA and his PhD in political science from Georgia State University. He serves on the Graduate Council and the Faculty Senate. In 2007, he was appointed to a Department of Education Federal Rulemaking Committee as a primary negotiator for regulations relating to the General Provisions for the Title IV programs of the Higher Education Act of 1965. In 2010, he coauthored a poster presentation for the International Preparedness and Response to Emergencies and Disasters conference in Tel Aviv, Israel, titled *Disaster Planning and Analysis: An Evaluation of Emergency and Disaster Preparedness Education*.

Robert Swan is an assistant professor of criminal justice at the Western Oregon University. He received his BS in political science, his MS in criminology and criminal justice, and his PhD in public administration and policy from the Hatfield School of Government at Portland State University, Portland, Oregon. His research interests include an exploration of the presence (or absence) of the new penology in the American criminal justice system; the study and use of interstate inmate

transfers by American corrections officials; decision-making influences on correctional management, especially among prison wardens and superintendents; and the impact of vicarious trauma on prosecutorial decision making among prosecutors tasked with prosecuting sex offenders.

Mark Zachary Taylor is an assistant professor at the Georgia Institute of Technology in the Sam Nunn School of International Affairs. Formerly a solid-state physicist, he earned his PhD in political science at the Massachusetts Institute of Technology. In his research, he uses regression analyses of patents, scholarly publications, and high technology production data to test hypotheses about the political economy of science, technology, and economic competitiveness. His research can be found in the journals *Foreign Affairs*, *Harvard International Review*, *International Organization*, *Journal of Political Science Education*, and *Review of Policy Research*.

Tobias Van Assche is a postdoctoral fellow at the University of Antwerp. He received his PhD in political science from Syracuse University. He has published a number of articles on political leadership and foreign policy decision making. His main focuses are leadership in international organizations and the study of groupthink and sequential decision making. He is also interested in the agenda-setting capabilities of political leaders.

Bas W. van Doorn is assistant professor at the College of Wooster. He received an MA in American studies from the University of Amsterdam in 2000 and a PhD in political science from the University of Minnesota in 2008. His research focuses on public opinion, political psychology, media and politics, and the presidency.

Dwight Vick is the graduate director of political science programs at West Texas A&M University, Texas A&M University system. His research focuses on issues relating to public administration and the policies surrounding addiction as well as social equity issues. Dr. Vick is the author of two books focusing on substance abuse, drug courts, and public administration. A member of the National Council for the American Society for Public Administration, he has written articles and participated in research that has been published in *Public Administration Review*, *PA Times*, *JAMA: The Journal of the American Medical Association*, and *Addiction*. He is the faculty advisor for the academic student-managed journal, *PB&J: Politics, Bureaucracy and Justice*.

Karen J. Vogel is professor of political science at Hamline University in St. Paul, Minnesota. She received her PhD from the Department of Political Science at the University of Oregon. She teaches courses in international organizations, gender politics, and European politics. Her publications include articles on feminist pedagogy and experiential education, as well as numerous conference papers on gender and European politics.

Gloria C. Walker is assistant professor of political science at Centenary College of Louisiana. She received her PhD from the University of California at Davis. Her research interests include political development, human rights, democratic consolidation and the quality of democracy, regional integration, and the role of intergovernmental and nongovernmental organizations in promoting liberalization.

Richard A. Wandling (PhD, Miami University) is a professor in the Political Science Department of Eastern Illinois University, where his primary teaching areas are public organization theory, government budgeting, and state and local politics and policy. His current research agenda focuses on environmental politics and policy making, which provides a rich set of opportunities for applying and testing alternative conceptions of political rationality and governmental decision making.

Edward Webb is assistant professor of political science and international studies at Dickinson College. After graduating from the University of Cambridge in 1992, he worked for several years in the British Diplomatic Service before leaving to pursue his PhD in political science at the University of Pennsylvania (2007). His research interests include religion and politics, cultural authoritarianism, and empires, with a focus on Turkey, the Middle East, and North Africa.

David L. Weiden is assistant professor of political science at Indiana University–Purdue University Indianapolis. He received his PhD from the University of Texas at Austin and his JD from the University of Denver College of Law. His research interests include comparative judicial decision making, the role of law clerks at the high courts of the United States and Canada, and trial courts. He is the coauthor of *Sorcerers' Apprentices: 100 Years of Law Clerks at the United States Supreme Court* (2006).

C. J. Williams is a doctoral student in political science at the University of North Texas. He received his bachelor's degree in political science from the University of Mary Washington and his master's degree in political science from the University of North Texas. His area of study is comparative politics. His main focus is political culture and its effect on individual-level attitudes and behaviors.

Leonard Williams is professor of political science at Manchester College in North Manchester, Indiana. He received his BA and MA from Southern Illinois University at Carbondale in 1974 and 1976, respectively, and his PhD from The Ohio State University in 1981. His primary research interests concern political ideologies. He has written a number of journal and popular articles on this and other topics. He also authored *American Liberalism and Ideological Change* and coedited (with Joseph Losco) *Political Theory: Classic and Contemporary Readings*.

James K. L. Wong is a PhD candidate and graduate teaching assistant at the Department of Government, London

School of Economics and Political Science. He obtained his BS (with first-class honors) in government and public administration from the Chinese University of Hong Kong in 2005 and his MS in political theory from the London School of Economics in 2006. He is specializing in judgment aggregation, democracy, and environmental political theory for his PhD thesis, and his research interests also extend to contemporary moral and political philosophy, as well as the nature and methods of political theory and political and social science.

Byungwon Woo is a PhD candidate in political science at The Ohio State University. He specializes in international organizations and international political economy and has strong game theoretic and methodological skills.

Candace C. Young has been a professor of political science at Truman State University since 1980. She holds a bachelor's

degree from Columbia College and earned her doctorate in 1982 from the University of Missouri. Her current research focuses on higher education policy, assessment of student learning, program evaluation, and legislators' use of information. She teaches courses in public policy, the presidency, and public administration and administers an internship program in Missouri state government. She has served on numerous statewide panels related to issues of higher education, including the Governor's Commission on the Future of Higher Education.

Scot J. Zentner is professor of political science at California State University, San Bernardino. He received his PhD from Michigan State University. He is the author of numerous reviews, journal articles, and book chapters. His research interests include political philosophy and American politics.

PART I

GENERAL APPROACHES IN POLITICAL SCIENCE

HISTORY OF THE DISCIPLINE

ELLEN GRIGSBY

University of New Mexico

Within the discipline of political science in the United States, *traditionalism*, *behavioralism*, and *postbehavioralism* are three distinct political science research approaches. That is, each offers a perspective on how best to carry out investigation, analysis, and explanation relating to politics and political life (Dryzek & Leonard, 1988). These three approaches represent different points of emphasis regarding the ways in which research about politics should proceed. For example, it will be seen that traditionalism—in comparison with behavioralism—tends to emphasize the usefulness of analyzing governmental institutions when studying political phenomena, whereas behavioralism tends to assert the importance of research into the intricacies of the behavior of individual political actors (e.g., citizens, lobbyists, candidates, elected officials). However, all three research perspectives share the belief that political science research should produce explanations that improve and deepen our understanding of complex political processes.

As one begins to analyze the meaning and complexity of traditionalism, behavioralism, and postbehavioralism, it is important to keep in mind three points. First, traditionalism, behavioralism, and postbehavioralism are broad categories, and within each category one finds a variety of political scientists who are not necessarily in agreement on all matters relating to the study of politics. For example, during the years in which traditionalism was the prevailing research approach within political science, Woodrow

Wilson (1911) delivered an address to the American Political Science Association (APSA) that called into dispute various claims made by previous APSA president James Bryce. In 1908, Bryce had stated that political science, that is, a scientific understanding of politics, was possible insofar as human actions tended to be similar, or repeatable, over time; thus, Bryce (1909) reasoned, one could generalize about patterns of human activity and draw conclusions about political life. Wilson (1911), however, while not altogether denying the existence of some degree of patterned activity over time, stressed the uniqueness characterizing human beings and human actions. Despite these differences, both Bryce and Wilson were representative of traditionalist political science.

Second, traditionalism, behavioralism, and postbehavioralism are often linked with certain decades in the development of political science in the United States. Traditionalism is usually associated with the political science practiced during the 19th and early 20th centuries. Behavioralism is generally associated with the post–World War II period, although its origins are sometimes traced back to the 1920s. Postbehavioralism’s appearance in the discipline had been noted and commented on by the end of the 1960s (Dahl, 1992; Dryzek, 2006; Ricci, 1984).

It is important to realize, however, that these historical markers are best used as general designations, because the development of these three research approaches was too multifaceted and complex to fit neatly into rigid time

categories. The emergence of a new approach did not necessarily completely or entirely displace an older one; for example, while traditionalism was challenged by behavioralism in the 1950s and 1960s, a number of political scientists continued to hold to traditionalism. Indeed, many contemporary introductory textbooks in U.S. politics continue to reflect the perspective of traditionalist political science. Moreover, not all subfields of political science were affected equally or simultaneously by the emergence of a new approach. For instance, the subfield of U.S. politics incorporated the behavioralist approach earlier than did the subfields of international relations and comparative politics (Sigelman, 2006).

Third, two of the three research approaches have tended to define themselves in opposition to their predecessors and, in so doing, have helped shape the manner in which those prior approaches have been remembered. Specifically, behavioralism defined itself in opposition to what it understood as constituting traditionalism, and post-behavioralism carved out its own identity, in part, as a critique of what it saw as the defining elements of behavioralism. As a result, one sees that the emergence of the newer approaches was coupled with a rejection of perceived deficiencies in the earlier approaches. In identifying what they saw as inadequacies in the older approaches, the newer approaches tended to highlight differences between the new and the old and, in some cases, tended to understate any similarities. For example, behavioralism emphasized its adherence to scientific method and, in so doing, sometimes gave the impression that that which it was attempting to replace—traditionalism—had not regarded itself as scientific. As becomes clear when one analyzes the actual writings of traditionalists, however, traditionalists generally saw themselves as political *scientists* and often made much of the fact that, as political scientists, they were not to be confused with historians (Farr, 1990; Gunnell, 2006). As early as 1910, an APSA president was calling on the discipline to employ statistical analyses to identify political patterns and test conclusions relating thereto (Lowell, 1910). Similarly, postbehavioralists, it will be seen in the discussion below, emphasized the importance of producing research that was relevant in addressing contemporary questions, but, in stressing their own newness relative to behavioralists, postbehavioralists often tended to understate the extent to which early-20th-century political scientists had also sought to use political science research to address urgent, relevant problems in U.S. life (Gunnell, 2006).

Traditionalism

Definition and Overview

Traditionalism is an approach defined by its focus on the study of political institutions, law, or a combination of these. In addition, traditionalism locates its scientific reliability in its grounding in careful historical or legal

investigations that are designed to produce thorough descriptions of the subject in question (Easton, 1971; Fried, 2006; Isaak, 1985; Macridis, 1992). That is, traditionalism is an approach in political science that seeks to study political phenomena by investigating law, history, and/or institutions such as the government as a whole or narrower institutions such as legislative, executive, or judicial bodies. A traditionalist seeking to understand how the U.S. Congress works would, thus, investigate such questions as what the law (e.g., the U.S. Constitution) provides for in terms of congressional powers and limits, how Congress as an institution has evolved historically, and how Congress as an institution fits into the larger institutional network of the U.S. government in its entirety. A traditionalist seeking to understand courts could follow a similar strategy of pursuing historical questions (e.g., how courts have evolved), legal questions (e.g., what laws govern courts and how courts have participated historically in shaping laws), or institutional questions (e.g., how courts are organized and administered as institutions). A traditionalist in the field of international relations might study international law or national laws and treaties relating to interstate interactions (i.e., foreign policy).

Traditionalist political science has not been an approach that has demanded narrow or exclusive disciplinary specialization. On the contrary, early traditionalist political scientists needed to be comfortable with such fields as history or law in order to pursue their work. Francis Lieber, who, in 1857, became the first person to hold an official political science professorship in the United States, was, in actuality, a professor of both history and political science at New York's Columbia College (Farr, 1990). Traditionalism's breadth is also revealed in APSA president Albert Shaw's (1907) comments that it was possible to find numerous political scientists participating in the American Historical Association as well as in "Economic and Sociological groups" (p. 178).

Traditionalist political scientists tended to be explicit in drawing connections between political science research and service to the public interest, in whatever manner the latter might be defined by the political scientist in question. Shaw's 1907 APSA presidential address is an illustration of traditionalism's linkage of empirical-scientific and normative-ethical objectives. "I believe that there will be a very general agreement," Shaw asserted, "that this Association can render an extremely useful service to the country, without departing in the smallest degree from its scientific methods" (p. 181). Shaw went on to suggest that APSA might undertake investigative projects on problems or concerns relative to "the public benefit" (p. 181). In fact, a perusal of the early records published in *Proceedings of the American Political Science Association* and in the *Annals of the American Academy of Political and Social Science* reveals traditionalists' interests in addressing child labor, political party reform, and other public welfare questions (Addams, 1906; Richberg, 1913).

Case Studies of Traditionalism: Frank Goodnow and Woodrow Wilson

For a fuller, more detailed understanding of traditionalism, one can look in greater depth at two examples of traditionalist political science. The first is Frank Goodnow's 1904 address to the first meeting of APSA. Goodnow's address included (a) a definition of what he called political science's "scope" but not a technical definition of political science itself, (b) an examination of what political science was to have as its research focus, and (c) a closing statement about political science's relevance. An examination of these three components of his address illustrates traditionalism's salient elements of institutionalism (in the emphasis on studying the institution of the state), legalism (in the emphasis on studying law and jurisprudence), a historical perspective, and attention to the public benefits of scientific inquiry.

First, in his address, Goodnow (1904) announced that he preferred to define political science's scope (i.e., that which political science was to study) rather than attempt a definition of political science itself. Setting out to construct a technically detailed definition of the discipline *per se*, Goodnow contended, was not as productive an enterprise as determining what the discipline should have as its focus of research. He pointed to what he termed the "dangerous" possibility of defining the discipline in too limited or too expansive a manner (p. 35). He proceeded to characterize political science's scope as the investigation of states. Political scientists were neither the first nor the exclusive researchers of states, Goodnow explained, but were, rather, unique in targeting the state as a primary subject for analysis. For example, historians might study historical states and might indirectly study contemporary states, Goodnow reasoned, and economists might investigate monetary matters relating to states. However, only political scientists would have as their "main interests" the direct, detailed, "scientific" analysis of states in all their complexity. Goodnow's comments suggest that the previously noted absence of disciplinary narrowness or specialization in traditionalist political science did not have to translate into the absence of disciplinary identity. Goodnow was, in this address, identifying himself as a political scientist as opposed to a historian, even while his approach to political science would employ historical perspectives. Moreover, in identifying the institution of the state (as opposed to the behavior of individuals, for example) as the central and defining subject matter of political science, Goodnow was conveying what is generally termed the *traditionalist orientation toward institutionalism*.

Second, Goodnow (1904) framed the study of states—and thus political science as a discipline—broadly. Political science's range of investigation was to include, he argued, the study of how the "State's will" was communicated, what comprised the "State's will," and how the "State's will" was carried out. In explaining what he meant by the communication of the "State's will," Goodnow made

reference to such matters as the values conveyed through a country's political ideas or political theory, constitution, and political party platforms. Political values influenced state policies or will. The second element—the "content of the State will"—Goodnow identified as law (p. 40). Law revealed a state's meaning. Indeed, one sees how closely Goodnow's traditionalist political science was attached to the study of law when one encounters his remark that "it is very doubtful" that anyone could become a political scientist—that is, that anyone could understand states "as an object of scientific study"—without a thorough understanding of law (pp. 42–43). To understand how states carried out their "wills," Goodnow continued, one needed to study administrative law, a subject that, in the absence of political science, had been frightfully neglected, he believed. He pointed to the benefits of studying the history of English poor laws as a guide for improving public administration generally.

Finally, Goodnow (1904) closed his address by expressing hope that political science could contribute to the public good. He identified teachers and political practitioners as two groups that could benefit directly from the knowledge produced by the discipline. Moreover, in disseminating a more descriptively accurate and comprehensive understanding of states, teachers and practitioners, in their respective professional roles, could contribute to an enhanced public well-being.

An examination of Woodrow Wilson's (1911) address to the seventh annual APSA meeting offers a second opportunity for scrutinizing more carefully traditionalism's breadth, a breadth critiqued as "unscientific" by later advocates of behavioralism. Although better known as the 28th president of the United States, Wilson also served as president of APSA and, in this latter capacity, argued against a narrow, specialized conception of political science. In fact, at one point in his address, he went so far as to assert that he disliked the name *political science*, which, he claimed, implied that human interactions should be studied objectively and narrowly. He argued for the designation *politics* rather than *political science* as a more suitable name for the study of the state and "statesmanship" (pp. 10–11). Although Wilson supported a scientific approach, if by science one meant accuracy and thoroughness in one's study of political life, he argued that such study should include an examination of literature, art, and poetry and should seek to inspire "vision" and "sympathy" (pp. 2, 10, 11). His understanding of political science, one finds, could hardly be broader, in that he concluded that "nothing" that has an impact on "human life" should be termed "foreign" to the discipline (p. 2). Wilson argued that the astute student of politics should demonstrate "a Shakespearian range" (p. 10). Although Wilson's immediate influence on U.S. political science was limited (Ubertaccio & Cook, 2006), his explicit embrace of an expansive politics is illustrative of traditionalism's lack of disciplinary specialization. In addition, a comparison of his approach with that of Goodnow is helpful in reminding students of traditionalism of the approach's internal diversity.

Behavioralism

Definition and Overview

Behavioralism emerged as a criticism of traditionalism's failure, in the view of behavioralists, to offer an approach to the scientific investigation of political questions that was sufficiently rigorous to produce predictive results based on quantitatively tested data. Specifically, behavioralism's defining elements include a focus on political actors and their behavior (or attitudes and opinions), value-free science, and the study of operationalizable questions through hypothesis formulation and empirical, quantitative research (Ricci, 1984). The focus on studying political actors represented a shift away from traditionalism's concentration on the historical and legalistic study of institutions.

In turning attention to the study of political actors, many behavioralists employed survey research to compare the attitudes of voters versus nonvoters, elites versus non-elites, partisan identifiers versus independents, or other subunits of populations. Students of congressional politics could enlist behavioral approaches to shift research away from the analysis of the institutional history of legislatures to an empirical investigation of the actual behaviors of congressional officeholders, staff, or congressional committee members. Behavioralists were interested, for example, in whether members of Congress spent greater time and devoted greater resources to the actual drafting of legislation or to responding to constituency demands, campaigning for the next election, or interacting with lobbyists. Empirical observation of such behaviors devoid of normative judgments (about how voters, nonvoters, elites, masses, partisans, independents, or congressional members "should" be behaving) would, in the words of David Easton (1971), correct the traditionalist "neglect of the most obvious element, the human being" (p. 203) in the conduct of research. Moreover, not only would a "value-free" science guard against the corruption of biases associated with normative preferences, but strict adherence to the study of questions translatable into operational variables and testable hypotheses would provide a more reliable knowledge than that producible by means of traditionalism.

In a 1967 essay titled "The Current Meaning of Behavioralism," Easton (1992) summed up behavioralism as having eight interrelated "intellectual foundation stones" (p. 47):

- "regularities": A rigorous study of political behavior would allow political scientists to make predictions, just as natural scientists could make predictive statements.
- "verification": Predictions were to be testable in order to be falsified or verified.
- "techniques": Political science should become increasingly sophisticated in its use of scientific data collection and testing methods.

- "quantification": Political science should use precise, quantifiable measurements; questions for research had to be definable in testable, operationally narrow and precise terms.
- "values": Empirical, scientific study operates by a process different from the pursuit of normative objectives.
- "systematization": Political science research should produce a body of systematic information; theories and generalizations could be based on sound inferences from testable data.
- "pure science": Political science research should operate in a value free manner, that is, independently of any possible subsequent use of scientific knowledge to address perceived social problems.

Robert Dahl (1992) traced the origins of this approach to the 1920s and to the work of Charles Merriman and the so-called Chicago School of Harold Lasswell, Gabriel Almond, V. O. Key, and David Truman. By the mid-1960s, one member of this school—Almond (1966)—was proclaiming "a new paradigm" in political science (p. 875). Almond described this paradigm as having three components: (1) a "statistical approach" geared toward "test[ing] hypotheses" that would generate (2) "probability" statements and (3) a study of the interaction of actors and units within larger political "systems" (p. 876). As is clear in Almond's language, this new behavioral approach was using highly specialized tools and methods drawn from such fields as math, statistics, economics, and psychology. Indeed, Almond pointed out that graduate study in political science was becoming increasingly focused on training students in the tools of "the scientific revolution"—tools that were turning political science in the direction of survey research, statistical sampling, and team-based and grant-funded quantitative research. During the post-World War II behavioralist period, publications in the *American Political Science Review (APSR)* became increasingly oriented toward statistical analyses of public opinion and behavior, especially in the subfields of U.S. politics and comparative politics (Sigelman, 2006). The new focus on studying that which could be precisely and narrowly operationalized seemed worlds removed from the one in which an APSA president could proclaim, as Woodrow Wilson had, his distaste for the term *political science* and his hope for a field of politics characterized by a "Shakespearean range."

A Case Study of Behavioralism: Herbert McClosky's "Consensus and Ideology in American Politics"

Herbert McClosky's "Consensus and Ideology in American Politics," published in the *APSR* in 1964, can serve as a case study for examining more closely the salient features of the behavioralist approach. As the title

of his article suggested, McClosky was interested in the extent to which consensus, or broad agreement, on political values existed in the United States. Although he opened his article with a brief overview of Tocquevillian comments on democratic culture and customs, McClosky framed his analysis around the investigation of specific hypotheses relating to the attitudes of political actors, in this case, actors grouped into two subunits of the U.S. population. McClosky hypothesized that the U.S. public was not uniform in its political views, that it was more supportive of democracy in the abstract than in particular cases, and that political elites (those whom he called *influentials*) were more supportive of democracy than non-elites were.

McClosky (1964) divided the U.S. population into two groups: the influentials and the general electorate. The influentials were individuals who had been delegates or alternates at the major party conventions in 1956, and the general electorate was simply the population at large. McClosky used survey research to measure the attitudes of both groups. With respect to the influentials, a sample of more than 3,000 members of the delegates and alternates at the Democratic and Republican conventions was surveyed. With respect to the general population, McClosky used a national sample of 1,500 adults. Both groups were surveyed on a variety of questions or items, and responses to the items served as “indicators” of “opinions or attitudes” about democratic values (p. 364). If a subunit manifested 75% or higher levels of agreement on an item, consensus was said to be demonstrated.

McClosky (1964) found greater degrees of consensus for democratic procedures among influentials than among the public at large. For example, his surveys contained 12 items to measure support for the “rules of the game” (procedural democracy). These items included statements that respondents were asked to register agreement or disagreement with and consisted of statements about whether a citizen could be justified in acting outside the law, whether majorities had an obligation to respect minorities, whether the means were as important as the ends in the pursuit of political outcomes, whether the use of force was ever justified as a political strategy, and whether voting rights should be expansive or curtailed. Survey results demonstrated, McClosky reported, that influentials expressed consensus on most of the 12 items, whereas the general electorate expressed consensus on none of the 12 items.

McClosky (1964) proceeded to report that, while both influentials and the general population exhibited broader support for freedom of speech when asked about this freedom in the abstract than when asked about freedom of speech for specific unpopular groups, influentials were more supportive than the general population of free speech for unpopular groups. McClosky concluded that one might be led to believe that citizens of the United States had reached consensus on the importance of freedom of speech until one looked at the noninfluentials’ responses to items

involving the application of the principle to particular cases, incidents, and people. For example, support for the rights of Communists, of persons accused of treason, and of convicted criminals was higher among the influentials than among the general population.

Furthermore, McClosky (1964) reported greater consensus among influentials on the importance of the democratic value of freedom than on the democratic value of equality. In fact, McClosky reported the absence of consensus among both influentials and the general electorate on the matter of whether all people were equal, as well as on questions relating to whether all people should be accorded equality. McClosky’s surveys included indicators to measure support for political, social, and economic equality, and his results suggested an absence of consensus among both influentials and the general electorate relating to all three types of equality. In other words, on statements relating to whether most people can make responsible decisions in governing themselves (political equality), whether different ethnic groups are equal (social equality), or whether all people have an equal claim to have a good job and a decent home (economic equality), consensus was absent.

McClosky (1964) also sought to measure what he understood as ideological clarity and the ability to identify oneself accurately along ideological lines. In evaluating survey participants in terms of their responses to particular statements relating to liberal versus conservative issues and their adoption of ideological markers (liberal vs. conservative), he found that influentials were more accurate than the general population in naming themselves as liberals or conservatives and in identifying a position as liberal or conservative.

McClosky (1964) closed his article with six summarizing generalizations. First, elites (influentials) were different from non-elites in terms of a greater elite support for democratic processes and a more complete understanding of political ideology. Second, a comparison of the education and economic circumstances of the two groups suggested possible (and testable) reasons for the differences in attitudes demarcating the two groups. Third, the level of support for democracy among U.S. elites was problematic on some issues (e.g., equality). Fourth, in spite of problematic levels of attitudinal support for democratic values, the U.S. system of Republican–Democratic politics appeared stable, a result, in part, of the nonparticipation of non-democracy-supporting non-elites. In short, democracy, McClosky stated, is sometimes “saved” by the nonparticipation of uninformed segments of the demos (p. 376). Fifth, classic accounts of democracy are inaccurate when claiming that the acceptance of democratic ideas is essential for the survival of democracy. Sixth, although McClosky advised political scientists against becoming sanguine about the lack of support for democratic processes among the population at large, he shared his hope for a wider disbursement of democratic values among segments of the U.S. population

as the country continued to promote educational and scientific advancements.

Students of political science can observe key elements of behavioralism in McClosky's work. First, behavior was understood by behavioralists like McClosky broadly enough to encompass opinions and attitudes. Second, it is evident that the turning of the discipline toward the study of the behavior of actors is regarded by behavioralists to be deeply revealing of that which was hidden as long as political science held to traditionalism's tenacious insistence on studying institutions. Behavioralism in the hands of political scientists such as McClosky had accomplished something no less remarkable than to reveal—and prove empirically—the flaws in classic, long-standing accounts of why and how democracies work. Third, behavioralists such as McClosky believed that they had succeeded in demonstrating that big questions such as the ones Wilson wanted political science to address were most reliably answered when turned into narrow, specialized, operationalizable questions and variables. After all, what could be a bigger, more Shakespearean question than the one McClosky had addressed? Yet, only by defining consensus in a narrow, testable way, for example, could McClosky study the question of democratic consensus in such a precise and careful manner. Fourth, behavioralists such as McClosky were not opposed to theoretical generalizations, but they believed that such generalizations were most appropriately developed out of concrete, empirical results; moreover, such generalizations could be used to generate new empirically testable questions. In the process of empirically measuring and testing, however, one was not to allow biases or normative presumptions (e.g., about the goodness of citizens of the United States or of U.S. democracy) to distort one's observations. Finally, the value-free political science of behavioralists such as McClosky tended to produce conclusions that left unchallenged the fundamental structures of the U.S. status quo. As Ricci (1984), Dryzek (2006), and Susser (1992) have noted, behavioralists saw their science as value free but, perhaps ironically, often tended to produce results that fit comfortably with normative assumptions regarding the fundamental soundness of the U.S. political system's ability to address progressively any problems that political science might bring into the open. Indeed, it might even turn out to be the case that what looked like a defect (the apathy of the uninformed) was discovered by means of behavioralism to be an asset.

Postbehavioralism

Definition and Overview

Postbehavioralism is an approach that emphasizes (a) that political science research should be meaningful, that is, that it should address urgent political problems; (b) that

science and values are inextricably connected; and (c) that political science should not seek to model itself on the strict application of scientific methods used in the natural sciences whereby research is driven exclusively by that which can be reduced to narrowly defined questions testable by the most rigorous, most specialized scientific procedures presently available. Postbehavioralists reacted against what they interpreted as behavioralism's excessive reliance on the purity of scientific precision at the expense of "relevance." While many postbehavioralists upheld the value of empirical and statistically oriented research, they tended to argue that behavioralism had overreached in emphasizing a strict adherence to narrow scientific procedures and that behavioralism's proclaimed value-free approach in actuality veiled a normative endorsement of the status quo and was thus both normative and conservative.

A number of postbehavioralist critics of behavioralism, including Peter Bacharach, Christian Bay, Hans Morgenthau, and Theodore Lowi, would join the Caucus for a New Political Science, organized in 1967 (Dryzek, 2006). The caucus continues to conceptualize political science as best carried out when political scientists integrate their identities as community members with their identities as scholars and thus craft research agendas in response to political needs. Political science should be steeped in everyday life and its concerns, not isolated from it as an esoteric, specialized, value-free science, according to Caucus statements (*New Political Science: The Journal*, n.d.).

In 1969, David Easton stated that postbehavioralism was proving to be a transformative force in the discipline. Easton discerned postbehavioralism's presence on two levels: first, postbehavioralism was identifiable as a collection of individual political scientists who shared a growing dissatisfaction with behavioralism's implications, and, second, postbehavioralism was manifested as a new intellectual outlook or approach that could guide research. In his presidential address to APSA, Easton delineated what he called a "distillation" of postbehavioralism's defining elements (p. 1052). Easton described postbehavioralism as a demand for relevance, as forward-looking, as application oriented, and as premised on the belief that it was nothing short of unethical for political scientists to remove themselves from the arena of deliberation and action when confronted with and surrounded by political problems. Easton made multiple references to the Vietnam War, to the threat of nuclear escalation, and to the struggles of the civil rights movement, and he noted that postbehavioralism was an indictment of behavioralism's irrelevance in finding solutions to such problems. Indeed, Easton pointed out that, from a postbehavioralist perspective, behavioralism could be charged with failing even to see such problems, a charge that must have sounded particularly strange to students of McClosky, schooled as they were in regarding influentials or elites as more adept at identifying and understanding political issues than were

members of the general electorate. Easton used the metaphor of blinders to describe what had overtaken a discipline that could not see the obvious, pressing issues of society even while it could describe in copious detail the merits of operationalization, hypothesis formulation, statistical analysis, verification, and falsification. Why, Easton asked, in an era of behavioralism (i.e., 1958–1968), had the *APSR* had only four articles on racial disturbances, only two articles on the practice of civil disobedience, only one article on problems of poverty, and only three articles on urban disorder?

Easton (1969) went on to explain that postbehavioralism's critique of behavioralism was deeply grounded in an understanding of science at odds with that embraced by behavioralism. For postbehavioralists, science was unavoidably based on normative assumptions; thus, according to postbehavioralists, a "value-free" political science (the kind of political science advanced by behavioralists) was not possible. Indeed, postbehavioralists asserted that to proclaim value neutrality was itself a normative stance (i.e., an assertion that a so-called value-free stance was better than its opposite). Postbehavioralism faulted behavioralism for not having acknowledged—and thus not having scrutinized—its own normative foundations and the ways in which those foundations shaped the direction of its research agenda. However, insofar as postbehavioralism was not a rejection of an empirically based science per se, Easton hoped that postbehavioralism could elucidate behavioralism's logic and correct its lack of self-awareness regarding its own assumptions rather than become a repudiation of the gains made in political science's shift away from the early and less scientifically oriented methods of traditionalism. In later years, some scholars would come to regard postbehavioralism's legacy as opening up possibilities of a more "eclectic" application of research methods to the study of political phenomena (Lane, 1990, p. 927).

A Case Study of Postbehavioralism: The Perestroika Protest in Political Science

In December 2000, *PS: Political Science and Politics* published "Voices: An Open Letter to the APSA Leadership and Members." The letter, signed by more than 200 political scientists, had been circulated by someone referring to himself or herself as "Mr. Perestroika." Echoing postbehavioralist concerns from decades earlier, the Perestroika protest letter charged APSA and *APSR* with having a disciplinary obsession with quantitative methodology at the expense of meaningful subject matter. Its narrow methodological focus, the letter argued, had rendered APSA and its premier journal remote from the actual world of scholarly work undertaken by most political scientists. The letter called for increased openness in APSA (e.g., in elections to APSA governing bodies and to the APSA editorial board), the inclusion of a broader range of articles in *APSR*, public

disclosure of survey results that could demonstrate widespread dissatisfaction with the discipline's direction, and greater openness to critical voices in the discipline. Noting that they had not organized themselves into an actual caucus or subunit within APSA, the Perestroika letter signees, nonetheless, claimed to speak for a broad segment of political scientists ("Voices," 2000).

Perestroika supporter Gregory Kasza expanded on the concerns expressed in the initial letter in "Perestroika: For an Ecumenical Science of Politics" (2001). One can see in Kasza's elaboration of the Perestroika protest six major points illustrative of postbehavioralism. First, it was claimed that U.S. political science had been distorted by the dominance within the discipline of highly specialized quantitative research approaches; because of this dominance, Kasza asserted, political scientists seeking to produce scholarly works using qualitative approaches were being marginalized. Second, Kasza argued that the marginalization of nonquantitative approaches constituted a breach of academic freedom. Political scientists, he contended, were being pressured to mold their substantive interests to fit the contours of rigid methodologies and frameworks; he mentioned an anonymous graduate student who had been warned that she would fail as a political scientist if she did not make her dissertation conform to rational choice strictures. Third, in allowing a narrow understanding of science to become dominant within the discipline, political science was undercutting its ability to produce sound scholarship. Indeed, Kasza went so far as to assert that a Perestroika movement could save the discipline from producing subpar scholarship. Fourth, Kasza made the quintessentially postbehavioral call for a political science that was more "relevant" in addressing substantive political concerns. Fifth, Kasza suggested that, in seeking to become as sophisticated a science as possible, political science had actually become something of an adventure in fiction. Kasza charged that scientifically oriented political scientists were, in all too many cases, operationalizing human motives, desires, and choices in such narrow terms (in order to be rigorous) as to render their subjects caricatures.

Finally, Kasza (2001) offered an alternative, "ecumenical" approach. Ecumenism, he explained, would be defined by three elements. First, an ecumenical political science would select problems for analysis and then make decisions about which research approaches would best address the problem, rather than adopting a research approach and defining problems to fit the requirements of the research approach. Second, an ecumenical political science would be explicit in its acceptance of a plurality of methods or approaches. Specialized quantitative methodologies would coexist with qualitative methodologies in an open and expansive political science; for example, graduate programs would reintegrate political philosophy and policy studies into their core areas in a Perestroika-driven discipline. Third, an ecumenical political science would value interdisciplinary study. Kasza urged political scientists to rethink graduate training and, specifically, to institute

dual-degree graduate programs. Political science graduate students should be encouraged to earn master's degrees in alternative and diverse fields, fields encompassing the humanities as well as hard sciences.

Conclusion

In calling for interdisciplinary collaboration, Kasza (2001) was aware that he and other Perestroika supporters were challenging political science to regain something from its earlier orientation. Indeed, in the postbehavioral Perestroika protest, one can recognize remnants of traditionalism. One is reminded of the cross-disciplinary approach of Goodnow when reading recent demands for interdisciplinary breadth in graduate training. At the same time, one can observe in postbehavioralism a parallelism linking the demand to study real people (rather than excessively narrowly operationalized "actors" described by behavioralists) with behavioralism's impatience with traditionalism's earlier preference for studying institutions rather than people. Neither the Perestroika protesters nor other advocates of postbehavioralism purged political science of behavioralism. In fact, at present, one can find all three approaches in political science. One might conclude from a study of the history of traditionalism, behavioralism, and postbehavioralism that political science, as a discipline, has been characterized not as much by complete breaks with preexisting research approaches as by periodic shifts and rearrangements of research emphases (Dryzek, 2006).

POSTMODERNISM

ROBERT SWAN

Western Oregon University

“Postmodernism,” writes criminologist John Crank (2003), “is a body of philosophy, methodology, and critical review of contemporary society that encompasses a variety of standpoints” (p. 153). Although we will revisit this simple description of postmodernism in some detail below, it is not uncommon that when first encountering this (or similar) encapsulations of postmodernism, many students of political theory are left scratching their heads. This is not necessarily the fault of the student. In fact, scholars, too, are left scratching their heads (sometimes angrily) over the dilemma of postmodernism and its “questionable” application to “real life.” Whether postmodernism and postmodern theories are applicable to real life is a debate, essentially, about the nature of reality and the value of some types of knowledge over others. This chapter of *21st Century Political Science: A Reference Handbook* intends to plunge the student directly into this debate. Drawing inspiration from famous postmodernist Jean-François Lyotard, this chapter intends to expose readers to knowledge that will both enhance their knowledge base and change the way they acquire and process knowledge in the future.

As a serious student of political science, the reader is likely referencing this handbook in order to answer specific questions about postmodernism. The bad news is that philosophical postmodernism rejects absolute answers to almost any question. The good news, on the other hand, is

that exposure to postmodern thought (and its application to empirical research) will broaden, and thus enhance, the reader’s knowledge of the world. Simply, while postmodernism may reject dominant narratives (i.e., “official” answers), it offers a great deal of insight into many social worlds that have gone largely unexamined. This handbook then will increase the reader’s level of sophistication regarding the “what is” and the “what ought to be” as conceptualized by postmodernist scholars. These are not unimportant questions in political science, and an enhanced knowledge of how postmodernism has influenced the way these realities are constructed will enhance the reader’s ability to think critically about political and other social phenomena.

This chapter summarizes the broad topic of postmodernism and distills it into its essential elements. First, it reviews the literature regarding what postmodernism is, in both a temporal and a theoretical sense. This review includes some of the common elements found in postmodern thought and writing, as well as some of the key differences among postmodern thinkers. Next, the chapter discusses the application of postmodern thought to empirical research. The large body of contemporary research influenced by postmodernism cannot be reviewed here. However, empirical work deriving from social construction theory is an area in which postmodernism has been most influential, and this chapter discusses public perceptions of crime and politics and the application of social construction

theory to our understanding of institutional life. Next, it discusses the policy implications offered by postmodern thought and research and, in particular, policy implications of the key postmodern assumptions that reality is entirely subjective and that there is a dark side to our existence in postmodern bureaucratic systems. Indeed, from a postmodernist perspective, dominant narratives and discourse blot out a myriad of politically and socially important experiences, perspectives, and voices of both individuals (e.g., prison inmates, radical political actors, sex offenders) and entire groups of people (e.g., undocumented immigrants, women, and ethnic and racial minority groups). Simply, postmodernists draw our attention to concerns that we would otherwise not consider. The chapter also examines future directions for postmodern theory in relation to the mass media and ends with a summary and a conclusion regarding the importance of understanding postmodernity as both a temporal and a theoretical frame of reference.

Postmodern Theory

[The postmodern world] is less a world of facts and figures and more a world of story and performance.

William Bergquist (1993, p. 23)

Although there is little consensus on its origins, the concept of postmodernism began to be used in the late 19th century and has been embraced by a wide variety of fields, including architecture, visual art, literature, philosophy, political science, sociology, fashion, and many others. In the postmodern era, two primary philosophical positions compete for dominance: objectivism and constructivism. Postmodernists attribute *objectivism*—the notion that we can objectively determine reality, discover universal truths, and make sound decisions based on our findings—to modernity. For postmodernists, objectivism is an illusion. Rather, *constructivism*—the notion that individuals live in unique realities and construct these realities based on the situation in which they find themselves (e.g., race, class, gender, social context)—provides a more comprehensive intellectual platform from which we can understand the nature of reality. For postmodernists, there is no universal truth but rather billions of individual truths.

From a philosophical perspective, and as it directly applies to the social sciences, many scholars highlight French philosopher Jean-François Lyotard for his articulation and popularization of postmodernism. Before his expression of postmodernism is discussed, it is useful to briefly discuss the general controversies surrounding the postmodern movement and some of its essential intellectual components and applications.

Many positivist scholars turn away from postmodernist frameworks because of postmodernism's rejection of

positivist assertions regarding scientific objectivity (and positivism's strivings toward that ideal), its lack of consistency as a theoretical framework, its lack of linguistic and empirical clarity, and the general disagreement in postmodernist literature on what postmodernism actually is. Simply, the concept of postmodernism is an often disputed and nebulous concept incorporating a number of temporal, spatial, and theoretical elements related to our understanding of multiple (if not countless) subjective realities. In fact, the concept is often debated, sometimes vigorously, within the postmodern literature itself. Additionally, the term *post modernism* is a broadly defined concept that incorporates a number of "strains" and subdisciplines, most of which are based on normative and subjective evaluations of past and present "realities"—all of which are individually subjective and subjectively interpreted. Simply, postmodern theories—in all their many forms—generally suggest an unmanageable subjectivity that could be problematic for our understanding of political phenomena and, indeed, for the maintenance of a cohesive social system.

That being said, postmodernism is an intriguing and potentially useful philosophical approach to understanding current phenomena such as the impact of globalization on social relationships, the behavior of political actors and institutions, and the origins and behavior of criminal justice institutions and policies, to name only a few.

For the sake of clarity, it is useful to briefly unpack the notion of postmodernism in its temporal, spatial, theoretical, and conceptual senses, beginning with modernity. "Modernity," asserts new-modernist Anthony Giddens (1990), "refers to modes of life and organisation which emerged in Europe from about the seventeenth century onwards and which subsequently became more or less worldwide in their influence" (p. 1). However, the term *modernity*, asserts Philip Selznick (1992), "is not a synonym for the 'contemporary' or 'present day'" (p. 4). If that were the case, the term *modernity* would be meaningless in the sense that people living in every historical epoch would consider themselves to be living in a modern period. Modernity, perhaps best marked by the Enlightenment and the advent of rational, scientific thought, global exchange, mass media, and mass production, served to break up previous forms of traditional, precapitalist and premodern life (e.g., small, isolated villages and communal living). Selznick cites four reasons for the transformation from the premodern to the modern society: (1) "structural differentiation" where there was none before; (2) "secularization" and religion's loss of power over governance systems; (3) "atomization" and the "weakening of social ties," which facilitate the likelihood that the number of shared experiences will diminish and, when present, will be unlikely to continue to have a bonding effect; and (4) increasingly coercive "rational coordination" through "contract and bureaucracy" (pp. 4–5), which has facilitated experiential fragmentation among individuals working within increasingly large organizations, as well as among those who must be served by them.

Like the terms *modernity* and *modernism*, the term *post modernism* generally indicates both a historical period and an intellectual position in any given field. Simply, the postmodern historical period followed modernity and is closely associated with rapid advancements in technology, increased surveillance, rapidly accelerating globalization, atomization, increasing social disconnection between people and places, and the increasingly rationalized, bureaucratic state. In theory, the postmodern *condition* (as opposed to temporal and spatial notions of postmodernity), according to Giddens, is, in part, related to society's generalized angst and confusion about the world and individuals' perception that they are unable to control, or even make sense of, their own destinies. In short, argues Jean-François Lyotard, modernity's "grand narrative"—the dominant, linear stories that we had constructed during the modern period about our history and (predictable) prospects for the future—have evaporated in the postmodern period. The evaporation of the grand narrative—or "the murder of reality," as Jean Baudrillard (1996, p. xi) refers to it—has led to a great deal of social angst and uncertainty.

Interpreting and applying postmodern thinking in the social sciences is no easy chore. However, one way to begin thinking about its application in the social sciences is to think about the possibility that the dominant narratives (e.g., "sex offenders cannot be cured" or "Iraq, Iran, and North Korea are the axis of evil") may not be accurate, and, it is important to note, are not the only important stories that need to be told in order to maintain social cohesion. Jonathan Simon (1997), for example, simply argues that postmodern thought revolves around concern over "what one thinks has changed in the present that requires breaking the useful interpretive frames that have been [traditionally] associated with modernity" (p. 171). One good example of applied postmodernism can be found in critical criminology. Critical criminologists, drawing from the assumptions of postmodernism, assert that hegemonic normative values, inextricably and historically linked to capitalism, are doing a great deal of damage to marginalized individuals, or rather, those individuals who do not conform to the grand narrative (e.g., racial and ethnic minorities living in poverty). Postmodernism in criminology then comprises theories that attempt to expand our conception of what is or is not criminal and what is or is not just. Thus, it should be no surprise that some criminologists are skeptical of penal strategies that attempt to predict or "solve" crime based on rigid and narrowly defined categories of *crime* and *criminal*—especially those that appear to sacrifice individualized justice or the greater collective good.

Postmodernism runs a similar course through the field of political science. Postmodernism in political science, as in the other social sciences, typically appears as forms of thought or of empirical research that question dominant narratives and seek out alternative voices and perspectives in order to enrich our political discourse through the inclusion of previously marginalized people. In addition to

recognizing the importance of subjective, individual realities, postmodern theories highlight the role of conflict in social life—an important underlying consideration for many students and scholars who study complex societies and their institutions. For example, John David Farmer and others argue that in understanding modern organizational forms and purposes, postmodernism can help us understand how (and why) the instrumentalism of modern bureaucratic structures limits the ability of human beings to self-actualize. This postmodern focus is supported by a number of scholars in multiple and varied fields who, although not necessarily postmodernist, continue to emphasize the negative effect that instrumentally oriented organizations may have on society and on those who work (or who are imprisoned) within them.

For example, in articulating a defense of postmodernism in public administration, Farmer (1997) asserts that postmodernism is a response to the dominant and oppressive narratives that have defined the modern period. Primarily, these narratives have had a negative impact on women, ethnic and racial minorities, sexual minorities, and the poor. In particular, Farmer is critical of the rigid, hierarchical form that bureaucratic structures typically take and the lack of focus on what he calls the bureaucratic "in-between." Farmer's focus on the bureaucratic in-between revolves around the idea that the study of bureaucracy should begin to focus more on the individual experiences of bureaucratic workers and less on bureaucratic technology and efficiency. In this way, we can run less oppressive—and thus more effective—bureaucratic institutions. This concern is somewhat derivative from the Hegelian notion that "man" will fight to the death in order to be recognized as something other than a slave and recognizes that social conflict results from the "enslavement" of marginalized peoples. As Farmer, Max Weber, and others see it, bureaucrats should be included in our understanding of oppressed peoples, primarily because they are enslaved and marginalized in a postmodern society. In suggesting reforms, then, postmodernists attempt to eliminate social conflict by allowing individuals to be recognized, considered, and treated as unique entities with unique perspectives and needs rather than as efficient (or inefficient) organizational instruments to be thought of only in aggregate, actuarial, or economic terms.

However, Frank de Zwart (2002) writes, "Postmodernists confuse wrongs of bureaucracy with arguments against modern science and then propagate relativism to clear up the muddle they created" (p. 482). In many ways, de Zwart is correct. Because postmodernism does not seek to obtain generalized knowledge, many argue that an entirely postmodern focus in the social sciences may leave us "empty-handed" in terms of usable facts. Simply, how does a society create sound policy based on anecdotal evidence? Obviously we cannot. But gaining an understanding of marginalized individuals and groups can help us expand the grand narrative to be more

inclusive and, perhaps, less destructive to the social life of those who are marginalized. This, some postmodernists argue, will eventually benefit our entire society. For example, some postmodern approaches can help us better understand how and why prisons evolved, how the courts have responded to a variety of individuals and social conditions, and how and why the mass media generate distorted, yet influential, images of some phenomena but ignore others altogether.

To give students a working knowledge of a fairly vast and complex body of work, the next section identifies and delves into the work and intellectual assumptions of some of postmodernism's more widely recognized thinkers. Further readings suggested at the end of this chapter provide more depth.

Postmodern Thinkers: Lyotard, Derrida, Foucault, Baudrillard, and Giddens

Postmodernists (broadly speaking) are not interested in building theory in a traditional sense. That is, they reject positivism and are not interested in building theory through what Thomas Kuhn (1962) has referred to as *normal science*. Rather, postmodernists are interested in studying the anecdotal (e.g., individual experiences and perceptions, media portrayals of phenomena, and language construction and usage) and the intellectual implications that these phenomena have for social life—especially among marginalized populations. It is important to note that postmodernists are quite willing to change their minds, about the conclusions they come to initially and recognize that knowledge is socially constructed and, thus, fallible. The following five thinkers are generally recognized as some of social science's most influential postmodern thinkers. However, and as discussed previously, postmodernism is a somewhat broad and nebulous concept, and the term *postmodernist* is rarely attributed to any of these philosophers (with the exception of Lyotard). That being said, all the thinkers discussed below are postmodern in the sense that they all reject positivist methodologies as the only valid form of knowledge acquisition. Similarly, they all reject modernity's grand narrative and explicitly or implicitly offer support to Lyotard's contention that the collapse of the grand narrative marks a new historical epoch.

Jean-François Lyotard

Our working hypothesis is that the status of knowledge is altered as societies enter what is known as the postindustrial age and cultures enter what is known as the postmodern age.

Jean François Lyotard (1979, p. 3)

French philosopher Jean-François Lyotard was concerned with articulating a coherent conceptualization of postmodernism and is widely regarded as having been successful in doing so. In *The Postmodern Condition*, Lyotard discusses the changing nature and acquisition of knowledge in the postmodern period, due, in large part, to rapidly changing technology and the resulting social transformation. Of interest in this work is Lyotard's discussion on the changing nature of knowledge. In a postmodern, technological age requiring more and more technical knowledge, knowledge for knowledge's sake is becoming less important to social survival and is being replaced by knowledge that may be sold to purchasers who seek to put it to work. In the social sciences, we see this transformation very clearly as knowledge becomes distinguished by its applied or theoretical nature. In addition to our ranking the natural or hard sciences over social sciences because of utility concerns, what we see is a trend toward valuing applied social science research far more than we value theoretical or philosophical social science research—a trend that many scholars see as disastrous for the acquisition of future knowledge. Implicit in Lyotard's discussion in *The Postmodern Condition* is the idea that those who possess the skills and knowledge needed to produce applied research will garner most of the social, political, and economic power, essentially leaving those who pursue knowledge for knowledge's sake outside the circle of power. In an ironic twist, then—irony is also a key feature of postmodern thinking—as we move away from the acquisition of broad-based, theory-driven knowledge toward increasingly specialized and applied descriptive and technical knowledge, we also decrease our ability to create generalizable knowledge in the future.

In other work, Lyotard has focused on the role of language in our acquisition and understanding of the world around us. In particular, Lyotard has focused on the collapse of the grand narrative, or rather, the *metanarrative*, due to social atomization (i.e., individual isolation) and the resulting rise of *micronarratives*. Micronarratives, according to Lyotard, represent the rejection of grand narratives at the individual level and the acceptance and integration of knowledge by an individual only as it relates to the individual's particular circumstance (i.e., ideology, race, class, gender, experiential realities). As discussed below, understanding the micronarrative is a key focus in constructivist research and is extraordinarily important to, for example, our understanding of how the media influence public perceptions of any given phenomenon.

Jacques Derrida

The history of writing should turn back toward the origin of historicity. A science of the possibility of science? A science of science which would no longer have the form of logic but that

of grammatics? A history of the possibility of history which would no longer be an archaeology, a philosophy of history or a history of philosophy?

Jacques Derrida (1967/1997, pp. 27–28)

As is the case with all the postmodernists discussed here, French philosopher Jacques Derrida questioned the notion that there is an objective truth. Rather, social reality is highly subjective and prone to abuses by powerful, self-serving elites who use their power to help society construct dominant narratives about reality. Unfortunately, these grand narratives are used to oppress or enslave social minorities, non-elite workers, women, and the poor, among others. Throughout history we can see that some “truths” were simply not that accurate at all. For example, the medieval notion that animals were as culpable (and thus, as punishable) as the humans who abused them in medieval bestiality cases, or that “quirky” women were witches, simply did not pan out over time. However, these “truths” did serve to facilitate the power interests of elites for a time. The same can be said of the United States’ early and long-lasting use of prisons as places of “rehabilitation,” or the perpetuation of Black slavery based on the accepted “truth” that African American slaves were less human than Whites. This latter, erroneous “truth,” perhaps more than any other social construct associated with American slavery, continues to haunt and create conflict within our society to this day.

According to postmodernists, we continue to live in a world rife with dominant and harmful mythologies designed to serve powerful elites. To cite one example, today, most citizens of the United States mistakenly believe that sex offenders (broadly defined) are incurable. Unfortunately, this “truth” is unsupported by empirical research yet has led to a large number of lifelong penal sanctions (including the possibility of the death penalty) for a large number of people convicted of sex offenses ranging from indecent exposure and simple kidnapping to the most serious types of rape and child molestation. It is interesting that the technologies of control and penal leniency (Foucault, 1977/1995) designed to control sex offenders have now begun to move to other offenders and, ultimately, will likely be used to maintain control over society more generally (see Diana Gordon, 1990). One recent example is a proposal by South Dakota corrections officials to make identities, addresses, and criminal histories available about all offenders, not just sex offenders, via online websites.

Language—and the manner and means in which it is delivered—is an important part of how society constructs reality and an important part of understanding the essential focus of postmodernism. Derrida, like Lyotard and Baudrillard, was concerned with the role of language in

our society and the way language is used to construct reality. In particular, Derrida was concerned with *deconstruction*—an examination of the underlying meaning and foundations of language, text, symbols, and other signs—in order to show that the dominant interpretation and foundational logic were flawed. In other words, multiple interpretations and meanings are possible and the foundation on which dominant interpretations rest is not solid ground but rather nothing more than subjective and biased beliefs.

Derrida, essentially, was criticized by peers and laypeople alike for his philosophical position—often likened to nihilism—that we cannot really know anything. In particular, academics attempting to generate useful, if not generalizable, knowledge vigorously opposed Derrida’s position and philosophy. Indeed, Derrida poses a somewhat serious epistemological problem for social scientists attempting to conduct, analyze, and interpret research and its findings: They all rest on subjective and biased foundations and so cannot really be true. Derrida’s intellectual position on the acquisition of knowledge generated a great deal of controversy precisely because it devalued all acquired knowledge.

Michel Foucault

In my view one shouldn't start with the court as a particular form, and then go on to ask how and on what conditions there could be a people's court; one should start with popular justice, with acts by the people, and go on to ask what place a court could have within this.

Michel Foucault (1980, p. 1)

Foucault’s (1977) understanding of power, influenced to a large degree by Friedrich Nietzsche and Max Weber, is linked, somewhat ironically, to the rise of an enlightened and egalitarian society in the 18th century. That is, argues Foucault, the rise of the egalitarian state in the 18th century also gave rise to distinctly less-than-egalitarian forms of social control. In order to ensure that the rights of “all” were respected, it was necessary to segment and discipline society in order to control, correct, and monitor transgressors. The disciplining and “correction” of transgressors set an example for society and ensured a more disciplined society. Therefore, in implementing egalitarianism, society in fact became more repressive and repressed. However, argues Foucault, these methods of control, correction, and surveillance were not born out of thin air and in fact had been present in very diffuse form for quite some time. Thus, Foucault’s understanding of power is heavily reliant on an understanding of preexisting forms of social control and their systematic linkage and evolution through reform (e.g., penal leniency) in the 18th century. In doing so,

argues Foucault, the egalitarian project merely enabled a more systematically intrusive governance system and repressed society.

In *Discipline and Punish*, Foucault (1977) shows how irregular forms of punishment were consolidated and “reformed” in order to better regulate and economize the state’s use of power in its attempt to transform and control society. The reformation of technologies of power was not so much about the elimination of certain behavior as about modulating social behavior so that it could more efficiently serve the needs of the state. In reforming punishment, then, the point was not so much to eliminate crime or criminals as to ensure that the efficient and economical regulation of crime and criminals served the state’s and, ultimately, society’s needs. Simply, crime and criminals serve the economic and political needs of the state, as well as establish a model, or an example, for the rest of society of how *not* to behave. This new “political economy” was facilitated by the development of *panopticism*. Panopticism, in relation to 18th-century reform, draws on, and integrates, notions of internment, hierarchical differentiations, and inescapable surveillance, much as the “new penology” does today. Thus, Foucault’s post-modern analysis regarding the rise of prisons not only helps us understand the driving force behind mass incarceration in our society but also gives us insights into the driving force behind all our institutions.

Jean Baudrillard

Reality is a bitch. And that is hardly surprising since it is the product of stupidity's fornication with the spirit of calculation—the dregs of the sacred illusion offered up to the jackals of science.

Jean Baudrillard (1996, p. 3)

Like Derrida, French philosopher Jean Baudrillard questioned the notion that there is an objective truth. Rather, social reality is highly subjective and prone to abuses by powerful, self-serving elites who use their power to shape society’s construction of dominant narratives about reality. In particular, Baudrillard was interested in *semiotics*, the study and understanding of how words (*signs*) interrelate. Specifically, semiotics is not necessarily interested in what words themselves mean but rather what they mean in relation to one another. For example, a semiotic approach to understanding an individual’s reality would assert that if an individual thinks about his or her automobile, the individual is actually thinking about those things that are not his or her automobile (e.g., home, spouse, school). This is because in order to construct an image of the automobile, an individual must locate it within a previously constructed web of meaning. This focus is evident in Baudrillard’s work, especially in his analyses of mass media.

In *The Perfect Crime*, Baudrillard (1996) is concerned that we have overburdened ourselves with meaningless,

confusing, referential imagery and positions the age-old philosophical question, “Why is there something rather than nothing?” (p. 2) as a straw-man argument. Baudrillard rebuts his own question with another: “Why is there nothing rather than something?” (p. 2). In answer, he argues that the perfect crime has been committed. In fact, he argues, we have murdered reality—false though it may have been to begin with—by extinguishing the grand illusion. The grand illusion, according to Baudrillard, is a personally coherent set of referential signs and meanings—to include the cherished notion of an *objective* reality and the formal illusion of truth, which we have traditionally used to hide from grim social realities. This “murder,” he argues, has been accomplished through the swamping of society in a sea of virtual and meaningless imagery (e.g., fantasy video games, the trials and tribulations of Paris Hilton, infomercials, Facebook). It is a *perfect* crime because the sea of meaningless images masks the “murder” of society’s mythical image of an objective reality. In sum, society continues to believe, generally, in an objective reality but only on an individual level. Reality, then, is very individualized, and perceptions of reality are unlikely to be shared on a very large scale.

Included in the idea that we are left to our own devices when constructing individual realities is the notion that we construct our individual realities based on imagery (signs and symbols) that were not real to begin with. In *Simulacra and Simulations* (1981), Baudrillard suggests that we are creating “bad” copies from false images—images originally constructed to mask the fact that there was nothing there to begin with. There are a number of rather poignant examples we can use to illustrate this point. The one that may resonate most with students is the notion that men and women seek physical inspiration from the sea of visual imagery depicting perfect bodies in perfect health. Unfortunately, very few of these images are real and are most likely airbrushed or digitally enhanced in some way. Thus, many of us attempt to personally re-create a physical reality that never existed to begin with, and inevitably we “produce” (e.g., through cosmetic surgery, obsessive dieting and exercise, and the conspicuous consumption of name-brand products) incomplete physical “copies.” Needless to say, the results of this “copying” process have led to a great deal of social and personal angst (e.g., the inability to accurately simulate our favorite supermodels, media stars, or sports heroes).

Anthony Giddens

The views I shall develop have their point of origin in what I have elsewhere called a “discontinuist” interpretation of modern social development. By this I mean that modern social institutions are in some respects unique—distinct in form from all types of traditional order.

Anthony Giddens (1990, p. 3)

British sociologist Anthony Giddens is a critic of modernity in the temporal sense and of postmodernism in its theoretical and philosophical sense. However, he is, arguably, a postmodern thinker in the sense that he places a great deal of importance on the study of power, knowledge acquisition (and the influence of power on knowledge acquisition), and the influence of knowledge on people's ability to alter their individual and collective social and material reality. In particular, Giddens confronts the question of how social reality is constructed. In his theory of *structuration*, Giddens's main area of concern is whether social reality is primarily influenced by individuals or by broad social forces.

In *The Consequences of Modernity*, Giddens confronts the issue of whether we are in a postmodern period, as Lyotard and others argue, or whether we are experiencing a type of radicalized modernity in which modernity has simply accelerated its pace. This radicalized modernity is primarily fueled by the disembedding processes of globalization, best characterized by global, cultural homogeneity; the disappearance of tradition; the erosion of place-based community; and the erosion (and shifting nature) of trust in persons, institutions, and abstract systems. In sum, radicalized modernity, although postmodern in a temporal sense, is not postmodern in a theoretical sense, because it is simply a continuation of modernity, not a temporal epoch that will usher in a dramatically different type of social order (such as the transition between premodern and modern societies).

Unfortunately, argues Giddens, riding the "juggernaut of modernity" has a dark side. Primarily because of the increasing lack of trust in abstract systems, institutions, and people, the accelerated pace of modernity is likely to usher in one or more forms of totalitarianism. We can see hints of this today from the expanded use of closed-circuit television on street corners and other highly engineered social environments, developed by governments in response to perceived (or contrived) security concerns. (Jonathon Simon, 1997, discusses this governance style as being very similar to an airport model of governance.) What this means, simply, is that much like Stalin's Soviet Union, internal passports (i.e., one or more forms of valid, government-issued identification) must be carried by individuals so that authorities can assess an individual's identity and background on a moment's notice and prior to letting that individual proceed in peace.

Applications and Empirical Evidence: The Construction of Social Power and Oppression

As Ray Surette (2007) has so eloquently put it, "Reality is a collective hunch" (p. 34). Perhaps no other sentiment exemplifies the empirical focus of scholars who view (and research) social phenomena through a postmodern lens. In other words, social and political reality is entirely subjective. In a democratic system subject to the constraints of people's beliefs about any given phenomenon, this may be

a problem. In fact, many postmodern thinkers challenge the idea that policies influenced by a majority of people who believe the same thing are good policies. In fact, postmodernists tend to think these policies are quite destructive both to marginalized individuals and to society as a whole. Primarily, they argue, this is because people have been subject to, and influenced by, powerful actors who attempt to dominate mediated policy discussions for reasons of power, economic profit, or both. Four areas of research influenced by postmodern thought illustrate these themes.

Socially Constructing Political Reality Through the Nightly News

Scholars conducting news media research are concerned with both *how* news media organizations represent reality and *how* the public makes sense of these depictions, not to mention the influence that both of these phenomena may have on policymakers and on public policy generally. Media scholars have generated a great deal of empirical data regarding the influence of the news on public policy. Generally speaking, the consensus among scholars is that the news, depending on the individual attributes of the viewer, has a more or less significant effect on people's attitudes toward any given phenomenon, which in turn may have an effect on the political agenda and on policy and election outcomes. Drawing from constructivist theory, many news media scholars view the news media (printed, electronic, and "new" media) as a sort of gladiatorial arena in which a variety of competing viewpoints vie for time and space. As media scholar Regina Lawrence (2000) puts it, "[The news] is an arena of problem construction in which struggles to designate and define public problems are waged" (p. 3). The "winners" of these competitions tend to dominate the policy process and, if consistently dominant in the media, win clear electoral, legislative, and policy victories on a fairly regular basis. Unfortunately (from a normative, postmodernist perspective), and with few exceptions, those who tend to dominate media also tend to be social, economic, and political elites.

The Social Construction of Crime Problems

Scholars who study the social construction of crime problems are typically concerned with why the public misperceives the actual incidence and seriousness of crime, how the public has constructed this distorted image, how these images influence crime control policy, and why, in many cases, these distorted images are resistant to actual data. In addition to focusing on news and other media portrayals of crime and criminality, scholars who study the social construction of crime problems are interested in the influence of individual attributes (e.g., age, race, gender, social context) and personal experiences on perceptions of crime as well as the way people think about crime and talk about crime with one another.

*The New Penology: Rabble Management
and Actuarial Risk Assessments*

Simply stated, the new penology is both a critical, postmodern theoretical framework and, in a temporal sense, an emerging set of penal policies related directly to the conditions of postmodernity. As a theory, the new penology is considered a critical or postmodern theory (depending on the epistemological assumptions of any given approach—e.g., *critical theories* are more tightly coupled to Marxist assumptions). Postmodern theories are used to analyze and critique postmodern penal strategies and asymmetrical uses of power, as well as to suggest reforms. The new penology, critical criminologists and penologists argue, is a postmodern penal strategy worthy of critique.

According to Feeley and Simon (1992), the new penology emphasizes penal language that moves away from the traditional focus of criminal law—individualized justice concerns such as due process, punishment, redemption, and rehabilitation—and focuses more on the management of risky aggregates (e.g., actuarial tables and risk assessment instruments designed to detect actual and potential criminal offenders by categorical grouping). Typically, arguments critical of the new penology assert that individualized “justice” cannot be achieved through current policing, adjudication, and incarceration processes due to a widespread institutional failure to recognize any moral dimension (i.e., moral deficits) to criminal offending or an individual’s unique characteristics and circumstances. The recognition of a moral component to criminal offending and the uniqueness of individual offenders have been the traditional focus of British and American transformative penal practices. These practices date back to (at least) U.S. colonial reforms implemented by the Quakers in the 17th and 18th centuries, which emphasized transformative punishment through solitary confinement, individual repentance, and successful reentry. The focus on individual offenders and their moral transformation continued onward through 19th-century Jacksonian-era institutional prison reforms and 20th-century Progressive-era indeterminate sentencing reforms—all of which continued to emphasize both the moral components of offending and the social requirement to transform each individual into a productive, conforming member of society. The moral dimensions of offending, as well as the individual characteristics and circumstances of offenders, it is argued, are now ignored by institutional actors, having been replaced by profit- and budget-maximizing concerns, actuarially based risk assessments, and other aggregate management techniques that favor institutional management interests over individual and community justice. For example, the potential riskiness of convicted sex offenders is determined through the use of actuarial tables and statistically advanced risk assessment instruments. Based on the statistically determined risk level of an individual, traditional justice concerns may be minimized or ignored. This is especially evident in policies that do not factor “needs” into a risk and needs assessment and policies that dictate

the indefinite (or lifelong) civil commitment (detention) of sex offenders even after they have served their prison time.

The new penology, echoes Lisa Miller (2001), is unconcerned with reducing crime through traditional rehabilitation programming or more comprehensive social programs. Rather, argues Miller, the new penology “is aimed at simply managing the harm that crime inflicts” (p. 170). Toward this end, the practices and policies of the new penology emphasize the empowerment of the U.S. culture of control (Garland, 2001; Gordon, 1990) through increased surveillance and actuarially based risk management that, it is hoped, can be used to prevent crime altogether. As summarized by Miller (2001), the new penology, in characterizing all aspects of criminal justice policy, relies only on actuarial precision and efficiency in order to manage and contain risky groups and individuals—what Lynch (1998) has also referred to as a “waste management” model of criminal justice.

Robert Bohm (2006), in tapping into the very essence of the new penology (without actually ever calling it so), argues that a “McDonaldization” of criminal justice has occurred. His thesis revolves around the idea that a hyper-efficient criminal justice system—reminiscent of the somewhat sinister, Weberian depictions of the technical-rational bureaucracy—has evolved to more efficiently handle increasing numbers of offenders and potential offenders. This efficiency, primarily handled by nonhuman technologies—technologies that are becoming increasingly advanced—allows elites to more effectively control society by creating a criminal justice system that is more calculable and predictable, although less just. Bohm ultimately argues that this new rationality has led to a great deal of irrationality in the sense that McDonaldized criminal justice systems do more social harm than good.

Implementation of new penology policies and practices can have unpleasant consequences for everyone but is especially problematic for particular groups and classes of people. For example, using racial criteria (e.g., racial profiling) as a determinant or an indicator of bad character or criminal intent, though legal (with some qualifications), is widely condemned as unfairly stigmatizing an entire group of people. Similarly, John Irwin (1985, p. 2) asserts that the use of police and jails is a form of “rabble” (i.e., people of lower socioeconomic status) management and that prisons have become “warehouses” (Irwin, 2005, p. 2) and receptacles for the “new dangerous classes” (p. 8). Finally, the most vehement critiques—if usually only implicit—surrounding new-penology crime control strategies revolve around the notion that these strategies may destabilize communities and actually create more, rather than less, crime and violence (Clear, 2007), as well as resistance to all formal authority (e.g., the No Snitch Movement in some African American communities).

Understanding Institutional Realities

Research influenced by postmodern assumptions can be both interesting and useful to the successful management of

our political and social institutions. For example, Earl Babbie (2007) has commented that institutional ethnography—an approach developed by Canadian sociologist Dorothy Smith as an approach designed to study the everyday experiences of women—was initially intended to better explain the institutional experiences of “oppressed subjects” (p. 300). Institutional ethnography then incorporates a variety of methodological approaches designed to capture the personal experiences of those who do not often (if ever) get to speak about their experiences. Dorothy Smith (2006) writes, “Institutional ethnography explores actual people’s activities as they coordinate in those forms we call institutions” (p. 14).

From the perspective of Smith and others, institutional ethnography is a postmodern form of critical microsociology that largely draws its inspiration from Marxism and the assumptions of postmodernism. As a standpoint approach to research and action (Harding, 2004)—theory building and activism based on understanding the world through the eyes of oppressed peoples—its effort to link the microsocial experiences of marginalized subjects to macrosocial structures and trends has generally been well regarded.

Policy Implications

In our discussion of postmodernism thus far, many of the policy implications may be self-evident to the reader. On the other hand, conceptualizing theoretical, philosophical, and applied postmodernism is a vast undertaking, and it is useful to briefly summarize some of its key policy implications. However, because postmodernism discourages the belief that we can objectively “know everything” (or anything, in the case of Derrida), that is, knowledge is subjective and dynamic, the following list is not all-inclusive. Rather, it is designed to inspire thinking about a few of the possible policy implications suggested by postmodernism:

- *Language:* Postmodernism’s focus on linguistics underscores the policy problems associated with language and the role of language in the social construction of reality at the micro- and macrolevels. In particular, Baudrillard’s focus on the mass media suggests that in a postmodern age, the mass media may be a highly problematic source of information—an assertion that has been supported by a number of media scholars conducting theory-driven empirical research.
- *Radical modernization:* Giddens’s idea that we live in an age of radical modernization suggests that we will become more and more disconnected from one another on the individual level, while becoming more and more homogenized and integrated on a global level. In sum, radical modernization, driven by radical globalization, will atomize individuals even while allowing us to check the weather in Bangkok

and to “facebook” with “friends” in Australia. The downside to radical modernization is that doubt, as Giddens argues, will become institutionalized on a global scale, and trust in individuals, institutions, and abstract systems will be eviscerated. What this may mean in the future is that we will continue to have more surveillance, less freedom, and an increasingly diminished ability to collectively solve social problems.

- *Knowledge for knowledge’s sake:* As Lyotard suggests, the pursuit of knowledge for knowledge’s sake may be a pursuit of the past. In the postmodern age, knowledge must be practical, applicable, and if at all possible, technically useful. Most important, this type of knowledge has monetary value and is generated in order to be sold. While all this may sound fine, there is a dark side to abandoning the pursuit of knowledge for knowledge’s sake. In particular, we can see the impact of this trend on university campuses everywhere as some departments—such as English, sociology, and history—continue to lose their places as important components of a university education, even among traditionally liberal arts schools.
- *Bureaucratic efficiency versus individualized justice:* Related to many of the concepts previously discussed, another dark side to postmodernity (and a key focus of public administration scholars and criminologists) is the focus on bureaucratic efficiency over individualized justice. In other words, the increasing focus on economic and technical efficiency in all our social institutions may cause a great deal of what Adams and Balfour (1998) have termed “administrative evil.” Simply, administrative evil is the disconnection of means from ends. From the critical perspective of postmodernists, it means that the ends, regardless of how these were conceived, are more important than the means institutions use to achieve their goals. Many political science, public administration, and policing and prison scholars, not to mention critical criminologists, have been pursuing this line of research for quite some time.
- *Individual realities of marginalized peoples:* A key aspect of empirical postmodern research is its focus on uncovering the stories of those who do not usually, if ever, get to speak about their experiences. Through this line of research, we have learned a great deal about street gangs, homeless people, prison inmates, ethnic and racial minorities, women, and the poor. This line of research has helped expand the dominant narrative to be more inclusive and more accurate. For example, the dominant U.S. narrative that everyone who works hard will live a comfortable life has now been shown to be less than accurate, especially when considering the plight of women, some ethnic and minority groups, and others who do not conform to

traditional and accepted images of the hardworking American. Indeed, thanks to the application of postmodernist ideas to empirical research, we can now safely say that *not* everyone who works hard will live a comfortable life.

- *Misunderstanding crime:* Many of the ideas and methodologies derived from postmodernism have uncovered not only that most people do not understand the seriousness or prevalence of crime, but that their attitudes toward crime, offenders, and victims tend to be influenced primarily by their own experiences, their discussions with others, and distorted and inaccurate media portrayals of crime and criminal justice. Unfortunately, it appears that hard data rarely seem to influence people's opinions about crime. The policy implications of this discovery are already being felt in this country as more than 2 million people continue to be incarcerated in our jails and prisons and more and more of our tax dollars go to building prisons, hiring additional police, and funding other types of criminal justice activity.
- *Atomization, social capital, and collective efficacy:* Finally, and perhaps most important, postmodernism and the conditions of postmodernity (or radical modernity, as Giddens argues) suggest that as trust erodes, we will become focused inward, less interested in collective goals, and less willing to work with others to solve problems unless the problems are directly related to our own needs. The implications of this condition are clear for a democratic system of governance: It will cease to function as it was intended, and powerful interest groups (and other elites) will dictate the terms of our democratic system.

Future Directions for Research

As should be clear to the reader by now, postmodernism offers an unlimited number of possibilities for future research. Some of the ideas and methodologies influenced by postmodernism (constructivism in particular) are content analyses, ethnomethodologies (institutional ethnography, ethnographic realism, confessional ethnography, critical ethnography, dramatic ethnography), narrative analyses, historical narratives, life histories, ethnographic case studies, focus groups, and other forms of qualitative research that seek out "thick descriptions" rather than generalizable, statistical knowledge. Future research based on any one of these methodologies is entirely up to the individual researcher. Whether it be philosophical, theoretical, or applied research, the number of topics at the researcher's fingertips is limitless.

That being said, a great deal of research effort continues to focus on the role of the mass media in our society. In

particular, researchers continue to pursue knowledge about the influence of the mass media on policymakers and public policy, their influence on people's beliefs about any given policy, their role in agenda setting, their influence on the behavior of people (e.g., video games and juvenile crime), and other areas in which the mass media are influential. Recently, attention has begun to focus on the new media, or Internet sources of information such as blogs, social network sites, advertising, Internet porn, and other Internet phenomena. Much more needs to be done in this arena as the old theories and understandings regarding the role of the media in society may not hold up when one is attempting to understand the influence of the Internet on society.

Conclusion

In this chapter, the broad topic of postmodernism was summarized and distilled into its essential elements. In discussing the essential literature regarding the assumptions of postmodernism, it is hoped that students will become intrigued and inspired by the ideas put forward by the founders of postmodern thought. The application of postmodern thought to empirical research holds a number of interesting possibilities—possibilities that do not necessarily need to supplant quantitative approaches but rather may supplement these approaches with a more complete accounting of subjects that are difficult to measure (in a quantitative sense) and are rarely the focus of positivist research. Because postmodernism offers students of the social sciences alternatives to positivism, it expands opportunities for substantive, empirical research on a variety of intriguing topics. Conducting research from a postmodern perspective is, in many ways (and as many postmodernists would argue), the route to intellectual freedom. Simply, the only limits placed on the postmodernist researcher are the limits of the researcher's imagination.

The policy implications offered by postmodern thought and research are significant. In particular, the notion that reality is entirely subjective and that there is a dark side to our existence in postmodern bureaucratic systems suggests a number of interesting research topics that have significant implications for public policy, organizational theory, criminology, and other areas of social science research. Important in any research agenda based on postmodernist assumptions is the notion that dominant narratives and discourse blot out myriad politically and socially important experiences, perspectives, and voices of both individuals (e.g., prison inmates, radical political actors, sex offenders) and entire groups of people (e.g., undocumented immigrants, women, ethnic and racial minority groups). Simply, postmodernists draw our attention to concerns that researchers would not otherwise consider or have considered from dominant perspectives and methodologies that intentionally (or unintentionally) obscure the day-to-day reality of marginalized groups.

An engaging example of the application of postmodern assumptions to empirical scholarship is the work of sociologist Sudhir Venkatesh (2008). Venkatesh wrote *Gang Leader for a Day: A Rogue Sociologist Takes to the Streets* after nearly a decade observing gang behavior from inside the gang. Although we cannot generalize from his research, it substantively contributes to our knowledge of urban poverty, the day-to-day activities occurring in a Chicago housing project, and violent street gangs (i.e., marginalized groups and individuals). This is not work that could have been accomplished (or accomplished as thoroughly) through positivist methods.

As is the case with much postmodern scholarship, Dr. Venkatesh stumbled into his line of research. Indeed, much postmodern research is a result of accident, chance, and the ability of postmodern researchers to expand (and implement) their sociological imagination (Mills, 1959). The task of the postmodernist is to move beyond the obvious and measurable and look behind the scenes at those phenomena that cannot be easily measured or quantified. Postmodern thought, then, is an important epistemological, ontological, and methodological step toward developing a more complete understanding of the confusing, diverse, and busy world that we live in today.

NEOINSTITUTIONALISM

MARK C. MILLER

Clark University

Neoinstitutionalism, also known as the *new institutionalism*, has been one of the primary methodological approaches in political science in the United States since the late 1980s. This methodology is especially popular among scholars of U.S. politics, although it is growing in influence in the fields of comparative politics and international relations. The new institutionalism combines the interests of traditionalist scholars in studying formal institutional rules and structures with the focus of behavioralist scholars on examining the actions of individual political actors. The new institutionalism thus explores how institutional structures, rules, norms, and cultures constrain the choices and actions of individuals when they are part of a political institution. In other words, “The neo-institutionalist perspective combines the microlevel study of individual behavior with the macrolevel sensitivity to the institutional factors that help shape that behavior” (Miller, 1995, p. 6). The new institutionalism is a very influential postbehavioralist methodology today among political scientists in the United States and abroad.

The Historical Roots of the New Institutionalism

The Traditionalists

From the 1930s through the 1950s, traditionalist scholars dominated political science as a discipline, and especially

political science as practiced in the United States. These scholars were most interested in examining the formal structures and rules that were the foundation of political and governmental institutions such as the executive branch, the legislative branch, and the judiciary. As Rhodes, Binder, and Rockman (2006) explain, “When political science emerged as a separate field, it emphasized the study of formal-legal arrangements as its exclusive subject matter” (p. xii). These studies were often descriptive in nature, using mostly qualitative methods, and they usually did not use broad theories in order to ground their observations in a larger theoretical perspective. Often they were quite normative in their desire to describe how political institutions ought to function, as opposed to the empirical study of how things actually worked in practice. Rhodes et al. thus describe the traditionalist approach in this way:

The older studies of institutions were rooted in law and legal institutions, focusing not only on how “the rules” channeled behavior, but also on how and why the rules came into being in the first place, and, above all, whether or not the rules worked on behalf of the common good. (p. xii)

The Behavioral Revolution

Beginning in the 1960s, political scientists began to move away from focusing on political institutions and instead almost exclusively studied the actions of individual

political actors. This so-called behavioral or behavioralist revolution thus focused on making the study of politics more scientific, and quantitative methods came to predominate in political science. The behavioralist revolution was especially critical for students of U.S. politics. Since good quantitative studies demanded large sample sizes, the more qualitative studies of single institutions and institutional rules waned in part because of their small sample sizes. For example, instead of studying the structures and rules of the courts, behavioralist political scientists studied specific decisions of individual judges. Or instead of studying the role of Congress in the broader system of government, behaviorists instead studied the choices made by individual members of Congress or by the voters in congressional elections. The hope was that political scientists would develop broad theoretical approaches that would be validated by quantitative empirical methods, thus moving political science away from the disciplines of history, law, and philosophy and instead bringing it closer to the scientific approaches of economics, sociology, and psychology. In some ways, the behavioralist revolution privileged those who wanted political science to be more like a hard science over those who favored so-called softer approaches to the study of politics. Behaviorists stressed rigorous empirical analysis of the behavior of individual political actors.

By the mid-1980s, many political scientists began to question whether the discipline should continue to ignore the traditionalist interest in political institutions but without abandoning what we had learned from the behavioralist approach in examining the choices of individuals. There was a worry that behavioralism could bring us only so far and that perhaps we had learned all we could from that approach. Therefore a so-called postbehavioralist movement arose within political science, designed in part to bring the study of institutions back into the discipline. It seemed natural to many scholars that political scientists would study political institutions again. As Rhodes et al. (2006) argue, “The study of political institutions is central to the identity of the discipline of political science” (p. xii).

The New Institutionalism Emerges

The new institutionalist approach has its roots in the early to mid-1980s. Often considered two of the leading founders of the new institutionalism, James G. March and Johan P. Olsen published a very influential piece in the *American Political Science Review* in 1984 titled “The New Institutionalism: Organizational Factors in Political Life,” followed by a book published in 1989 titled *Rediscovering Institutions*. They continued to argue for further institutional analysis in their 1995 book, *Democratic Governance*. In all these now classic pieces, these scholars argued the then radical position that political scientists needed to rediscover institutional analysis in order to understand better the behavior of individual political actors within political institutions. In other words, according to

these authors, studying individual political behavior without examining institutional constraints on that behavior was giving scholars a skewed understanding of political reality. Thus, March and Olsen argued that studying institutions again would allow political scientists to discover more of the complexities of politics. As these authors have concluded in a more recent work, “Institutions empower and constrain actors differently and make them more or less capable of acting according to prescriptive rules and appropriateness” (March & Olsen, 2006, p. 3).

By the mid- to late 1990s, the new institutionalism came to be one of the dominant approaches in political science, especially among those who studied U.S. politics. Today it is also used by many scholars in comparative politics and in international relations as well. Referring to what was happening among scholars in the late 1980s and throughout the 1990s, Barry Weingast (2002) has stated, “Political science witnessed a revolution in the study of institutions” (p. 660). Institutional analysis was being used to study everything from the legislative process to effects of social movements and to the politics of the judiciary. The new institutionalist approach has become so influential that Pierson and Skocpol (2002) could claim that “we are all institutionalists now” (p. 706).

A Return to the Law and Legal Analysis

Since traditionalist political science had its roots in the approaches of law and philosophy, perhaps it is not surprising that many scholars in the field of judicial politics have strongly embraced the new institutionalism. While the behaviorists, using mostly quantitative methods, often studied the decision-making processes of individual judges, some political scientists continued to argue that legal rules, structures, and doctrines still mattered. After a long period in which the behavioralist approach dominated the study of judicial politics, Rogers Smith (1988) was one of the first to argue that public law scholars should use a more institutional approach. As Smith (2008) has argued in a more recent work, “It took no great insight to realize that these emphases on the importance of rules in bounding action and constituting actors, while simultaneously enabling rule-interpreters to make choices that shaped outcomes, might aid scholars of law and courts” (p. 48). In the late 1980s, many judicial politics scholars had already started using new institutionalist methods. By the late 1990s, the new institutionalism approach in judicial politics had become so popular that Howard Gillman and Cornell Clayton in 1999 edited two highly influential volumes of essays on new institutionalist studies of decision making on the U.S. Supreme Court. About this same time, new institutionalist approaches were also becoming popular for scholars of U.S. legislatures (see, e.g., Miller, 1995), of the U.S. presidency (see, e.g., Skowronek, 1993), of various aspects of comparative politics (see, e.g., Hall, 1986), and of international relations (see, e.g., Keck & Sikkink, 1998).

The New Institutionalism in Comparative Politics

Just as the new institutionalism was becoming important in the study of U.S. politics and law, it was also becoming a feature of much of the work in the study of comparative political institutions. In the late 1960s, Roy C. Macridis (1968) called on comparative politics scholars to abandon the traditionalist approach in that field, which he termed “parochial, monographic, descriptive, bound to the West, . . . excessively formalistic and legalistic, and insensitive to theory-building and theory-testing” (p. 79). His solution was an early call for postbehavioralist analysis of “governmental institutions and political elites, their role, their levels of performance and nonperformance” (p. 89). By this, he meant comparative scholars should focus on parliaments, the executive, the judiciary, the civil service, and other aspects of governmental institutions. Macridis’s efforts were in part a precursor of what happened in international relations in the early 1980s, when various scholars called for “bringing the state back in” to international theory building (see, e.g., Evans, Rueschemeyer, & Skocpol, 1985). Some of the new institutionalist analysis in comparative politics chose a “thin” approach, which looked at the role of institutions in various public policy issues in various settings. Others took a “thick” approach, which added governmental institutions to the previous analysis of other social structures, such as social movements, political coalitions, and ideological constraints within a society (see, e.g., Kohli et al., 1995). In other words, should the study of governmental institutions be separate from cultural studies or be used in combination with cultural approaches (see, e.g., Lecours, 2000)?

Especially since the 1990s, new institutional analysis has been used in a variety of comparative politics arenas. One important work in this area was an edited volume titled *Do Institutions Matter? Government Capabilities in the United States and Abroad* (Weaver & Rockman, 1993). This book covered a wide range of issues, from specific public policies such as energy policy to foreign affairs and to separation-of-powers issues. Other scholars used new institutional approaches to study such public policies as health, welfare, and industrial development (see, e.g., Steinmo, Thelen, & Longstreth, 1992). Some scholars studied the role of governmental institutions in the economy more generally (see, e.g., Hall, 1986). Others studied the role of international organizations such as the European Union (see, e.g., Pierson, 1996). Other scholars studied comparative legislative institutions; comparative leadership, mostly in the executive branch of government; comparative courts; or comparative electoral systems. Other new institutionalist scholars studied topics that many do not immediately associate with political institutions, such as comparative revolutions or political conflict in general (see, e.g., Peters, Pierre, & King, 2005). Another set of scholars began to examine informal institutions, such as political norms and rules that are “created, communicated, and enforced outside of officially sanctioned

channels” (Helmke & Levitsky, 2004, p. 725). These informal rules can have serious political ramifications in many societies. Other scholars are using new institutionalist analysis to examine concepts such as state formation.

Is There One Definition of a Political Institution?

While many political scientists now use a new institutionalist approach, there has been little agreement among these scholars on a single precise definition of what constitutes a political institution. As Rhodes et al. (2006) note, “Despite the incredible growth in institutional studies in recent decades, we lack a singular definition of an institution on which students of politics can find wide agreement” (p. xiii). All seem to agree that a political institution is an entity of its own and that an institution is more than just the sum of the policy preferences of the individuals who comprise it. For example, Carey (2000) argues that political institutions “establish guidelines for deliberation, the aggregation of preferences into collective decisions, and the implementation of those decisions” (p. 735). And all seem to agree that an institution is a concept more than a place or a thing. Thus Rawls (1971) conceptualized political institutions as “an abstract object” realized in “thought and conduct” (p. 11). March and Olsen (2006) have provided this rather complicated definition of what they study:

An institution is a relatively enduring collection of rules and organized practices, embedded in structures of meaning and resources that are relatively invariant in the face of turnover of individuals and relatively resilient to the idiosyncratic preferences and expectations of individuals and changing external circumstances. (p. 3)

Thus, according to these scholars, “Institutions give order to social relations, reduce flexibility and variability in behavior, and restrict the possibilities of a one-sided pursuit of self-interest or drives” (March & Olsen, 2006, p. 7).

Although political scientists cannot seem to agree on a definition of an institution, it has been easier for many scholars to state what institutions are not. Thus Brigham (1987) has noted that “institutions are not simply robes and marble, nor are they contained in codes or documents” (p. 21). And Howard Gillman (1999), in his institutional approach to the study of decision making on the U.S. Supreme Court, titles one of his chapters “The Court as an Idea, not a Building (or a Game)” (p. 65).

Multiple Levels of Analysis

One of the advantages of new institutionalist approaches is the fact that the new institutionalism allowed scholars to use multiple levels of analysis simultaneously. The

traditionalists focused mainly on macrolevel analysis, using institutions as the unit of analysis. Thus the traditionalists studied institutions *qua* institutions. The behavioralists, on the other hand, focused almost exclusively on microlevel analysis, because understanding the actions of individual political actors was their primary concern. The new institutionalists, however, said that scholars could and should examine multiple levels of analysis, often within the same research project. Thus, for example, for congressional scholars, the unit of analysis could be the individual member of Congress, or a congressional committee, or the party caucuses, or congressional leadership, or a chamber of Congress, or the Congress as a whole (see, e.g., Miller, 1995). This ability to examine multiple levels of analysis simultaneously also enabled new institutionalist scholars to explore the interactions between and among political institutions, giving rise to many studies concerning, for example, the relationship between U.S. legislatures and the courts (see, e.g., Miller & Barnes, 2004), between Congress and the presidency (see, e.g., Fisher, 1981), between the bureaucracy and the Congress (see, e.g., Ripley & Franklin, 1980), and so forth. As Scheingold (2008) concludes, one of the essential messages of these studies is “the fluid and reciprocal character of institutional interaction” (p. 742).

Three Streams of New Institutionalism

One of the reasons that there is no single agreed-on definition of a political institution is that the new institutionalist approach is really an umbrella term for a wide variety of complementary but clearly different methodologies (see, e.g., Thelen, 1999). In their now classic discussion of the various strains of new institutionalist analysis within political science, Hall and Taylor (1996) argue that there are at least three branches of new institutionalism: *rational choice institutionalism*, *sociological institutionalism*, and *historical institutionalism*. Rational choice institutionalism has its roots in economics and formal modeling analysis. Sociological institutionalism has its roots in sociology, anthropology, and cultural studies. And historical institutionalism has its roots in the disciplines of history and law. Scholars such as Hay (2006) and Ansell (2006) want to further subdivide these three branches by inventing new labels such as *constructionist institutionalism* and *net work institutionalism*. Schmidt (2008) uses the term *discursive institutionalism*. But most scholars focus more on the three main streams of new institutionalist analysis.

Rational Choice Institutionalism

Rational choice institutionalism is one of the major approaches within the new institutionalist umbrella, with its roots in economic analysis and formal theory. A popular approach within this stream is the use of game theory

to explain political decision making (see, e.g., Shepsle, 2006). Thus, according to Rhodes et al. (2006), “Rational-choice institutionalists think of institutions as a system of rules and incentives” (p. xiii). These rules are often contested so that one set of political actors can gain advantage over a different group. Rhodes et al. continue:

Institutions in this sense provide arenas for conflict, and efforts to alter them stimulate conflict inasmuch as they change the rules of the game in such a way as to alter the allocation of advantages and disadvantages. From this vantage point rules are never neutral, but are instead part of a struggle between challengers and holders of power. (p. xiv)

Thus rational choice scholars often focus on a single institution in a specific time frame, although more and more are looking at institutions across time.

This conceptualization of institutions as arenas for game playing underlies much of the formal modeling done by rational choice scholars. Thus the rational choice scholars are simultaneously theoretical and empirical. The formal models produced by rational choice scholars attempt to simplify the political world in order to explain its essential features. According to Weingast (2002), these formal models allow rational choice scholars to study “how institutions constrain the sequence of interaction among the actors, the choices available to particular actors, the structure of information and hence beliefs of the actors, and the payoffs to individuals and groups” (p. 661). These models help answer questions such as why political institutions are needed in the first place, why they take on particular forms, and why they survive over time. This approach puts a great deal of stress on concepts such as efficiency and rationality of decision making. As Shepsle (2006) explains this approach, “The research program of rational choice institutionalism is founded on abstraction, simplification, analytical rigor, and an insistence on clean lines of analysis from basic axioms to analytical propositions to empirical implications” (p. 32).

A subset of rational choice institutionalism has come to be known as the *strategic approach*. This approach is especially popular among judicial scholars. Accepting the new institutionalist idea that institutions constrain the behavior of individual political actors, these scholars argue that individuals within political institutions often act strategically, thus anticipating the reactions of their colleagues to their decisions, as well as anticipating the reactions of other institutions to their decisions. Instead of pushing for their ultimate policy preferences, these actors temper their actions by anticipating the reactions of others. Thus their votes and actions are constrained by their understanding of institutional factors and by the anticipated reactions of other actors and other institutions to their decisions. As Hall and Taylor (1996) conclude, “One of the great contributions of rational choice institutionalism has been to emphasize the role of strategic interaction in the determination of political outcomes” (p. 945).

Sociological Institutionalism

A second branch of new institutionalist analysis is the sociological approach. It has its roots in organizational theory, anthropology, and cultural studies. This stream stresses the idea of institutional cultures. These scholars see institutional rules, norms, and structures not as inherently rational or dictated by efficiency concerns, but instead as culturally constructed. As Hall and Taylor (1996) explain, sociological institutionalists argue that “even the most seemingly bureaucratic of practices have to be explained in cultural terms” (p. 947). These scholars tend to define institutions more broadly than do scholars in the other two streams. These scholars tend to look at the role of myth and ceremony in creating institutional cultures, as well as the role of symbol systems, cognitive scripts, and moral templates. At times these scholars take on a normative approach to the study of political institutions, and they tend to blur the line between institutions and culture. Their work often focuses on questions of the social and cultural legitimacy of the organization and its participants. The pioneering work in this field was done by sociologists at Stanford University (see, e.g., Powell & DiMaggio, 1991). This branch of new institutionalist analysis is probably the least influential among contemporary political scientists, although many use the concepts of institutional culture and institutional will in their research projects.

Historical Institutionalism

The third branch of new institutionalist analysis, historical institutionalism, has received a great deal of attention among political scientists, especially those who use more qualitative methodologies in studying U.S. politics. But it is also becoming more popular in comparative politics and in studies of international relations. In some ways, historical institutionalism is the hardest of the three branches to define because it includes so many different scholars and so many different methodological approaches. This branch includes an eclectic group of scholars with a wide variety of research agendas (see, e.g., Lecours, 2000; Thelen, 1999). Despite their differences, there are some common notions in this line of research. As Pierson and Skocpol (2002) argue, within this group of scholars, “Everyone seems to realize that theoretical eclecticism, multiple analytic techniques, and a broad comparative and historical purview work best” (p. 698).

Generally, historical institutionalists define political institutions broadly and are interested in changes in institutions over time. For example, Hall and Taylor (1996) argue that historical institutionalists define institutions as “the formal or informal procedures, routines, norms, and conventions embedded in the organizational structure of the polity or political economy” (p. 938). Rhodes et al. (2006) note that historical institutionalists “see institutions as continuities” (p. xv). Thus, according to these scholars,

political institutions may be constitutional in nature, procedural, or programmatic. In comparative politics, the new institutionalist scholars compare policies not only across time but also across countries (Peters et al., 2005).

Historical institutionalists think a lot about *decision trees* and *path dependence*, terms of art meaning the effects that one decision has to limit the available future choices for any political actor or institution (see, e.g., Peters et al., 2005). While historical institutionalists clearly focus on institutional analysis, these scholars “rarely insist that institutions are the only causal force in politics” (Hall & Taylor, 1996, p. 942). Thus, for example, historical institutionalists acknowledge the importance of ideas in creating political change, as well the role of economic or cultural variables in political decision making. They also attempt to identify critical junctures in the political process, as well as the goals of political actors. Some of these studies are inherently comparative, whereas others focus on a single political institution. As Sanders (2006) argues, for historical institutionalists, “What is mainly of interest is the construction, maintenance, and adaptation of institutions” (p. 42).

While it is difficult to pinpoint a precise definition of the historical institutionalist approach, there are some common traits in this line of scholarship. Pierson and Skocpol (2002) have listed three important characteristics of this approach. First, they note that historical institutionalists “address big, substantive questions that are inherently of interest to broad publics as well as to fellow scholars” (p. 695). Thus the research puzzles of these scholars are often rooted in real-world political problems. Second, these historical institutionalists “take time seriously” (p. 695), and thus they can trace changes in politics and institutions over history. Extending the time frame that political scientists consider gives them more empirical data to analyze and allows an examination of events that occur rather rarely, such as democratization and revolutions. It also allows scholars to explore lengthy, large-scale, but slow-moving social processes in which change often occurs only incrementally. Some of the focus of these scholars is thus on institutional development issues (see, e.g., Orren & Skowronek, 2002). Third, historical institutional scholars pay clear attention to the contexts and configurations that allow them to “hypothesize about the combined effects of institutions and processes” (Pierson & Skocpol, 2002, p. 696). In other words, historical institutionalists usually do not examine only one institution or process at a set point in time, but rather they tend to look at politics as a very complex set of processes and institutions that vary over time and that interact in interesting and unexpected ways. As Pierson and Skocpol (2002) conclude, “The focus is on explaining variations in important or surprising patterns, events, or arrangements—rather than on accounting for human behavior without regard to context or modeling very general processes presumed to apply at all times and places” (pp. 696–697).

Conclusion

The new institutionalist approach in political science remains a very influential methodological tool. Many scholars consider themselves to be new institutionalists, and there is no one precise definition of what constitutes the new institutionalism. There are at least three streams within this broad approach, and some scholars borrow ideas and concepts from multiple streams in order to answer their research questions. The one thing that all these scholars have in common is that they take institutions seriously because they feel that political institutional factors constrain the choices of individual political actors. In other words, the new institutionalism in political science is a postbehavioralist methodological approach that stresses the importance of political institutions in furthering our understanding of politics and government.

SYSTEMISM

HYUNSUN CHOI

University of North Florida

Systemism has emerged as an important worldview and methodological approach in social science. This approach is generally against reductionism, and it sees everything either as a system or as part of a system. This view is different from individualism or holism. While individualism emphasizes individuals in society, holism focuses on structure. Systemism can be seen as an alternative way to make sense of a complex world.

This chapter explores the historical and theoretical development of the systemism approach in social science by addressing its applications and policy implications. Systemism contributes to methodological issues such as systems analysis, modeling, case study, and survey research, and it may have significant policy implications in the fields of environmental politics, administrative decision making, and urban politics and development.

The Evolution of Systemism Theory

In social science studies, there are generally three different broad perspectives to understanding behavior: individualism, holism, and systemism. Systemism can be seen as being situated between individualism and holism.

Individualism

Individualism emphasizes the important role of an individual in society. It claims that society exists for the benefit

of the individual, and the individual must not be constrained by government interventions or made subordinate to collective interests. Ayn Rand, who was a philosopher of the early 20th century, wrote that humans are ultimate ends in themselves, not means to the ends of others. The pursuit of one's own self-interest and happiness is the highest moral purpose of life. Thomas Hobbes, John Locke, Adam Smith, and Max Weber used similar ideas to describe the world in the philosophical tradition of individualism. Social systems are collections of individuals.

In sum, individualism focuses on (a) protecting natural freedoms and rights, (b) pursuing the development of society for the benefit of the individual, and (c) supporting capitalism with minimum government. However, it fails to recognize the causes of social problems and the importance of government intervention.

Holism

While individualism is an important way of thinking about individual choices and behaviors in everyday life, holism emerged to address some of the limitations of individualism. Individualism argues that individuals maintain a primary influence over society. It may embody a degree of validity in explaining society, but it fails to credit the influence that the social environment maintains over our thoughts, beliefs, and opinions. Thus, holism asserts that society must be analyzed as a whole system rather than simply in terms of its individual components.

Holism emphasizes that the primary focus of society should be on the collective unity or greater good of the whole. It may support big government and government intervention for the greatest common good. Thus, holism focuses more on political institutions, and its applications may tend toward totalitarianism. The works of Georg Wilhelm Friedrich Hegel, Auguste Comte, Karl Marx, and Émile Durkheim support holism with an emphasis on social or class structure (Bunge, 2000).

Systemism

Systemism tries to synthesize individualism and holism. It seeks a common ground to view the world from a systems perspective, including micro- and macrolevels. Both individualism and holism have some pitfalls. First, individualists fail to realize the existence of systemic social problems such as poverty, discrimination, and underdevelopment. Second, holism may not see individual actions as the source of social change. Systemism is a moderate approach between these two extremes, and it extracts elements from both approaches. The concept of the system is a key aspect of this worldview. Systems are everywhere, and they have diverse sizes and forms over time and space. Political processes and administrative units are systems, and society, community, and neighborhood are also systems. Systemism is more realistic and therefore more useful than individualism or holism.

According to systemism, everything is either a system or a component of a system. Mario Bunge (2000) described the following postulates of systemism:

1. Everything, whether concrete or abstract, is a system or an actual or potential component of a system.
2. Systems have systemic (emergent) features.
3. All problems should be approached in a system rather than in a sectoral fashion.
4. All ideas should be put together in systems (theories).
5. The testing of anything, whether idea or artifact, assumes the validity of other items, which are taken as benchmarks, at least for the time being.

These rules may imply that nothing should be evaluated as an end itself, but rather as a component of something larger or more meaningful. Systemism analyzes individuals and structures in society dynamically, whereas individualism and holism fail to recognize that there is a middle ground between individual and collective agency and to recognize the interrelatedness of both agency and structure in studying micro-macro questions.

Applications

In the real world, system is everywhere. With the broad definition of system, systemism offers practical applications in diverse fields. Those applications can reduce tensions

between centralism and laissez-faire in politics and government interventions.

Systemism in Social Science

We may think of systemism as a spider and a web. When a spider weaves a web, the spider spins and maintains the web and so creates a structure to help itself survive and prosper. The web shows how agency and structure are intertwined and interdependent. In this way, the differences between systemism and individualism or holism can be understood. Systemism blends two incomplete explanations of the relationships of humans with each other and their environment (Denis, 2003). While people interact with different entities, they deal with large amounts of information in the context of every other interaction. Just like the example of spider and web, people are having diverse interactions based on previous perceptions and interactions. This is an illustration of the interdependent nature of structure and agency that is identified by and explored through systemism.

Adam Smith's *invisible hand theory* is another good example of systemism. Smith's thesis is dependent on an individual's interpretation of collective agency, and therefore the invisible hand is a feature of both human agency and structure. The interrelationship of structure and agency thus occurs within the context of a system. The invisible hand theory aggregates individual agency into a macrolevel benefit. Poverty, for instance, is not necessarily solely the result of individual action or structural malfunction. It may be a combination of different factors from individual bad behavior, coupled with the features of a social structure. While any one person may not experience all poverty-related factors, including contributing factors such as access to quality housing, education, or health care; individual behaviors such as wasteful spending; or unfortunate circumstances such as death, disability, sickness, or chronic unemployment, all those issues occur within the system and have unanticipated consequences.

Urban Politics

Urban politics is an interesting example of the systemism approach. Many scholars have used the systems approach as a framework for the analysis of city politics and policy. David Easton (1965) was one of the first researchers to develop an influential theoretical framework that facilitated an understanding of politics, including urban politics. He applied the open system models of natural science to political science. In this view, political systems are open to influences from their environments. The environment of a political system has inputs and changes that can shape the political process. Political and administrative decision makers need to respond to the environment, and the political system transforms inputs into political and policy outputs.

The political process decides allocations of resources. The result of the decision-makers' processing of inputs yields outputs. The impact of these concrete decision outputs of political actors produces a set of outcomes that send information back into the environment. The process is best viewed as a continuous stream of feedback to the environment that may result in the alteration and creation of inputs that keep cycling into the system (Pelissero, 2003). The systems approach has proved to be a useful way of thinking about the interrelationships of actors, institutions, and the environment of cities.

Case Studies

In studies of urban politics, researchers can focus on one city and employ structured methods of data collection and interpretation to develop and test theories of urban politics. Intensive or ethnographic observations have been used in some classic case studies of cities. For example, the early studies of community power were case studies in which researchers often lived in a community, interviewed residents and experts, analyzed data on local government, and observed the play of local politics. The first-generation urban studies tend to focus on single cities.

The case study method has developed into a comparative method, in which multiple cities are studied or independent case studies are launched in several cities, employing similar methods and research questions. One of the early examples of comparative case studies is Williams and Adrian's (1963) classic study, *Four Cities*. Williams and Adrian studied community power and political process in four cities over time. Another example is the Bay Area research projects that examined multiple cities in the San Francisco area. This study reveals the importance of institutions to the political process. The comparative case study approach has been used to advance theories on city politics, including citizen participation in policy making, political parties, urban regimes, racial and ethnic politics, schools, and moral controversies in cities.

Survey Research

Another approach in systemism is survey research for comparative cross-sectional studies of cities. Researchers began collecting data on a large number of cities and used statistical techniques to assess the determinants of politics or public policies in those cities. In more recent years, the development of new statistical methods and the greater availability of data sets on cities have led to more analysis conducted over time. Computers, advanced statistical software programs, and web-based data sets have increased the opportunities for performing comparative time-series analysis of urban political and policy changes. An example is David R. Morgan and John P. Pelissero's (1980) study of the impact of municipal reform; research on mayors; bureaucratic policy changes; and studies of

city councils, including structural evolution and electoral campaign changes.

Systems Analysis

Systems analysis is a mosaic methodology in decision making. It integrates elements from a variety of disciplines—engineering, sociology, biology, philosophy, psychology, economics, and computer science. Broadly, system analysis makes us look at problems as assemblies of interdependent components. For example, in the context of sewage treatment, if organic sewage is being dumped into a river or lake, it generates an inordinate demand for oxygen. However, oxygen is also needed for bacterial decay, which uses the oxygen-converting organic matter to break down inorganic products. Consequently, dumping tends to deplete the oxygen supply of surface waters. By killing off the bacteria of decay, dumping brings a halt to the aquatic cycle of self-purification. Environmental or sanitation engineers may simply try to domesticate the decay bacteria in a treatment plant, artificially supplying them with sufficient oxygen to accommodate the entering organic materials. Inorganic residues are released, and because they have no oxygen demands, the engineers think the problem is solved.

However, this treatment does not consider the river or lake as a system in nature. The treated sewage becomes rich in inorganic residues of decay—carbon dioxide, nitrates, and phosphates—that support the growth of algae. This chain reaction brings more environmental problems into the natural system. Thus, it is important to take a systemism approach when dealing with these kinds of management and environment issues. There are four basic steps in system analysis: problem formulation, modeling, analysis and optimization, and implementation.

Problem Formulation

This first step may be the most difficult one in analyzing a system where we live and work. This step includes a detailed description of the task and identification of the important variables and their relationships. For instance, in the case of an urban transportation system, one using the systemism approach begins by deciding whether the prime objective is better service, lower cost, less pollution, or something else. Then it is necessary to decide what data are necessary: travel times with different transportation modes; passenger miles by gender, age, race, and income; passenger miles by time and place; and so forth. Last, one must identify key decision makers in the urban area and their motivations.

Modeling

A model is a simpler representation of the real-world problem, designed to help researchers. Models can be

physical reconstructions of the real thing, with constants and variables. The modeler's task is probably more artistic than rigorous, more creative than systematic. Model development needs to find a balance between including all relevant aspects of reality and keeping the model simple enough so that it is in line with current theoretical discussions, computation time, and data availability. Ultimately, the test of a model's quality is how effective it is in helping to solve the original problem. In a model, all components are interconnected. Sometimes, it is necessary to develop a quantified model—a set of mathematical relationships.

Analysis and Optimization

If a model finds the best strategy for resolving a given problem, simulation and sensitivity analysis are important tools for determining the best course of action. These techniques are closely related to the development of computer technology. Simulation allows replicating the actual operation and events of any program in an organization. For example, when one studies patrol-deployment strategy in a police department, police administrators can find simulation models valuable for the following purposes: (a) They facilitate detailed investigation of operations throughout the city, (b) they provide a consistent framework for estimating the value of new technologies, (c) they serve as training tools to increase awareness of the system interaction and consequences resulting from everyday policy decisions, and (d) they suggest new criteria for monitoring and evaluating actual operating systems. When one simulates the dispatch and patrol operations of most urban police departments, incidents are generated throughout the city and distributed randomly in time and space according to observed statistical patterns. Simulation provides a tool to assist in answering a wide range of allocation questions.

Sensitivity analysis helps modelers find the best strategy for solving the original problem. Sensitivity analysis consists of making very small changes in a model to show the extent to which results may be altered because of change in one or a few factors. For example, in real practice, sensitivity analysis can use a small change, such as an 8% decrease in judges or prosecutors or a 3% decrease in police.

Implementation

The last step refers to the procedure by which the results from the model are translated into a set of actions in the real world. However, these four steps seldom occur in perfect sequence, and the systems approach is highly interactive. For instance, the sequence might work out in the following way: formulating the problem, selecting objectives, designing alternatives, collecting data, building models, weighing cost against effectiveness, testing for sensitivity, questioning assumptions, reexamining objectives, looking at new alternatives, reformulating the

problem, selecting different or modified objectives, and so forth.

Policy Implications and Directions in the 21st Century

How do we define the appropriate role of government? Systemism may have a new way of thinking of government's role in the 21st century. For centuries, people have argued whether the proper focus of society should be on the community or the individual. Individualism and holism may be seen as the two extreme views in the real policy world. In the United States, liberal and conservative views have battled over the role of government. Generally, conservatives argue, based on the perspective of individualism, that we must preserve morals and increase personal responsibility instead of the social welfare system. Liberals may argue that government needs to involve itself more in social problems and regulate big business to change government systems. Both views may have good arguments for their points. However, these two views have hardly any common ground. Systemism may offer an alternative way for politics and policy. It can offer a framework to connect the concerns of individualism and holism in order for us to reach our future goals.

What are the policy implications of this approach? One interesting issue is environmental policy and climate change. In national and international politics, climate change is an inevitable issue for the 21st century. Already in the United States, liberals and conservatives, Democrats and Republicans, are battling over this global environmental issue. The result has been gridlock on the issue for more than 10 years now. Can systemism offer some common ground for understanding climate change?

In the climate change debate, some argue that human action is the cause. Others postulate that while humans may have some responsibility for climate change, this phenomenon is based in a natural cycle of warming and cooling that has occurred for thousands of years. The crux of the climate change problem is that global warming has both known and unknown ramifications that impact individuals, regions, governments, and continents differently. The scale of the natural hazards that could be unleashed by continuing global warming trends does not fit current climate models. In spite of all our greatest efforts, predicting the intensity or location of the consequences of global warming is nearly impossible at this point.

In the past, most research has ignored the complex interrelationships among individual human groups, their environment, their social constructions, and the myriad different organisms and structures that interact with them each day. Because of this oversight, much information about climate changes and their impact has not been gathered. How does society address a problem whose scope is unfathomable at our current level of understanding? By addressing all known

aspects of the problem, implementing policy to mitigate all known impacts, and preparing for all unknown impacts simultaneously. Systemism may provide an important framework to address the climate change issue through its systematic and climatological aspects for 21st-century global public policy.

Conclusion

This chapter distinguishes two main methodological approaches, holism and individualism, and associates with them policy prescriptions of centralism and laissez-faire. Between these two perspectives, systemism offers a moderate way and common ground for reduction of political and social conflicts. Because of the nature of systems, the systemism approach may be more a mosaic than a single approach. It includes bits and pieces from a variety of disciplines. At the same time, interdisciplinary efforts can increase systemism's applicability to diverse fields. Systemism has influenced our current research methods in the areas of system analysis, case study, survey research, simulation, and sensitivity analysis. For political science in the 21st century, systemism will continue to contribute to our discussion of the political process, policy making, and management issues.

RATIONALITY AND RATIONAL CHOICE

RICHARD A. WANDLING

Eastern Illinois University

The rationality concept has figured prominently in some of the most fascinating, heartfelt, and at times acrimonious scholarly exchanges among political scientists. This chapter focuses on five important intellectual developments in the study of rationality from a political science perspective: (1) the 1960s as an important era in scholarly exploration of the relationship between public policy making, decision making, and rationality; (2) Herbert Simon's seminal and hugely influential theorizing on decision making and the limits of individual rationality; (3) the legacy of bounded rationality, particularly in Graham Allison's models of decision making; (4) the seminal work of a group of economists and political scientists during the 1950s and 1960s who figured prominently in the emergence of modern rational choice theory; and (5) the modern scholarly debate over rational choice. A central theme of this survey is the tension between economic and political definitions of rationality and how these conceptions of rationality have shaped contemporary political science theory and research.

Policy Making, Decision Making, and Rationality

Charles Lindblom's "The Science of 'Muddling Through'" (1959) was an important milestone for a whole generation of theory and research on public policy making. Although

an economist by training, Lindblom became a major figure in political science, particularly among scholars of public administration and public policy. While exploring the intersection of public policy making and administrative decision making, Lindblom compares two "methods" of policy analysis and choice, identified as "rational-comprehensive" and "successive limited comparisons" (p. 81). The first method is summarized as the "root" method and the latter, the "branch" method. Lindblom presents the rational-comprehensive method (or model) in a negative light, as not only empirically flawed social science but as normatively questionable as a guide for sound decision making and public policy making in a democracy.

The rational-comprehensive model assumes that policies are crafted through a process that involves advance specification of key values and goals, tightly configured means-ends analysis, extensive analysis that is at once comprehensive and characterized by high levels of information, and a prominent role for theory-driven analysis. Out of this analytically intensive and information-rich process emerges a policy choice that is the "best" relative to decisional elements such as values and goals, actual analysis, and means evaluation. The successive limited comparisons model, however, is the one embraced by Lindblom. With this model, also known as incrementalism, values and goals often are not distinct, analysis of relations between ends and means is limited and perhaps even inappropriate, the options considered are few in number and

differ only marginally (or incrementally) from each other, and policy choices emerge out of a “succession of comparisons” (p. 81) among a limited set of options. If theory is important in the rational-comprehensive method, decision making in incrementalism is process oriented, with goodness of a decision defined as achieving agreement among analysts—that is, agreement rather than some objective evidence that the information, data, and analysis clearly point to the best option.

Lindblom’s framework represents a broadside against application of the rational model to policy making and administrative decision making. This comprehensively and tightly specified version of rationality does not work as either description or explanation of public policy making. However, to Lindblom this does not mean that policy making lacks rationality or is characterized by irrationality. It comes down to how rationality is conceptualized. Lindblom does not portray a chaotic or random universe with irrationality run rampant; there is a science or logic to “muddling through.” Decisions are made through a politicized process rather than based on compelling, objective logic of the facts, evidence, and information collected. In fact, to Lindblom the rationality of incrementalist-style policy making is preferable. Incrementalist-style rationality is very compatible with a pluralistic political system, particularly in producing options that rank high on political relevance and are grounded firmly in existing knowledge and information held by government officials.

Lindblom set the stage for further examination of rationality during the pivotal 1960s period of political science scholarship. Paul Diesing (1962) argued that rationality has multiple meanings and lamented the tendency to view rationality primarily as either technical or economic rationality concerned with organizational productivity and economic efficiency. Diesing develops a philosophy-oriented framework that argues for the study of three other forms of rationality—social, legal, and political. Aaron Wildavsky (1966), one of the 20th century’s most influential political scientists, takes the cue and warns strongly against framing rationality in terms of decision-making strategies or techniques such as cost–benefit analysis, systems analysis, and program budgeting. For political science, the latter were flawed because they indicated an economics-oriented view of rationality. To Wildavsky, political rationality is important in its own right because government leaders must calculate political costs such as the resources needed to generate support for a policy, the implications of a policy decision for reelection, and the possibility of provoking hostility for decisions not well received.

Simon, March, and the Limits of Rationality

Herbert Simon greatly influenced theory and research in fields as disparate as organization theory, decision sciences, and bureaucratic policy making. His ideas also

played a role in the development of rational choice theory—whether through his criticism or through efforts by some rational choice practitioners to incorporate Simon’s rationality assumptions into their research.

Simon provides a synthesizing approach to rationality that incorporates both economic and psychological dimensions while exploring the limits or boundaries of individual and organizational rationality. A starting point is Simon’s (1957) distinction between “objective” and “subjective” rationality. Objective rationality is evident if a decision or choice is the “correct behavior for maximizing given values in a given situation” (p. 76). With this version of rationality, a clear test is available to ascertain the correctness of a decision or choice. Subjective rationality incorporates psychological elements by considering the decision maker’s actual knowledge—or knowledge limitations. In short, based on the information possessed by the decision maker, what might be concluded about the rationality of a decision? Simon’s concern is that standards for achievement of objective rationality go well beyond the actual decision-making abilities of individuals, specifically individuals in complex organizations. The realities of psychology and human cognition mean that full knowledge of decision-related information is not possessed, and the full range of options also is not identified and evaluated in a comprehensive way.

Simon (1955) criticizes the rationality of classic economic theory and its model of “economic man” (p. 99), who is assumed to have extensive and intensive knowledge relative to the decision-making environment while possessing a well-organized and stable system of preferences, as well as a skill in computation that enables him to calculate the best alternative that reflects the highest point on his preference scale. The economic model of rationality is problematic for the development of a theory of the business firm or any type of organization, and this is the case whether the goal is empirically or normatively based theory. To Simon, real, empirical human rationality does not achieve the demanding standards of the classic economic model. Perhaps with a hint of things yet to come in the social sciences (including political science), Simon uses the term *rational choice* while inventorying key limits or constraints in “rational adaptation” behavior, particularly with respect to the range of alternatives considered, preferences, and decision maker knowledge of potential decision “payoffs” (p. 100). Simon also criticizes the “global rationality” assumptions that he sees embedded in game theory and castigates the economic rationality model as a “simplified model” that fails to capture the complex reality of a “choosing organization of limited knowledge and ability” (pp. 101, 114).

With this foundation, Simon fully develops his theory of *bounded rationality*—with important contributions from coauthor James March (March & Simon, 1958). The rationality of “administrative man” (p. 137) is compared and contrasted with the rationality requirements of classical economics—and statistical decision theory. In the

latter versions of rationality, decision optimality is the standard in an environment with a full and clear specification of alternatives, knowledge of consequences of the alternatives, and a “utility ordering” (p. 138) in which key values at stake guide fully conscious assessment of the alternatives. March and Simon, however, argue that individuals in organizational settings are not guided by the quest for optimality (i.e., the best possible decision) but rather make decisions at the point that an alternative is deemed satisfactory. They assert that “most human decision-making, whether individual or organizational, is concerned with the discovery and selection of satisfactory alternatives; only in exceptional cases is it concerned with the discovery and selection of optimal alternatives” (pp. 140–141). This point sets the stage for the much-referenced *satisficing* concept, which is a decision-making process in which the satisfactory standard is reached and the option selected is deemed as sufficient by the individual decision maker. In sum, the option is satisfactory—and it suffices. Satisficing is a major departure from the quest for the best possible choice as determined by extensively analyzing a wide range of alternatives and factoring in a full range of decision-related values or preferences. This model of decision making also parts company with the classic economic model in another way, through March and Simon’s assertion that alternatives are evaluated sequentially rather than simultaneously. At some point, an alternative is considered to be acceptable, given organizational goals, values, and decision-maker knowledge; the decision process concludes at that point.

Satisficing, however, does not take place in a vacuum; it is embedded in an organizational context in which rationality is bounded by “repertoires of action programs” (March & Simon, 1958, p. 169) that circumscribe and also channel the decision-making process. March and Simon give particular emphasis to the role of organization structure as the setting for individual decision making. Organization structure comes to play an important role in establishing the “boundaries of rationality” (p. 171). In essence, when we speak of the rationality of individual decision makers, we also are considering the role that organizations play in funneling or channeling decision making and even compensating for the limits of human rationality.

Later, Simon (1985) shed additional light on this path-breaking approach to rationality by noting that bounded rationality really is interchangeable with the term *procedural rationality*. Rationality is rooted in an organizational process of identifying alternatives, collecting information, and considering important values. This is another way of saying that there is no such thing as a substantively or objectively optimal decision. Simon sees this distinction as parallel to the concepts of procedural and substantive due process, observing that “in the same way, we can judge a person to be rational who uses a reasonable process for choosing; or, alternatively, we can judge a person to be rational who arrives at a reasonable choice” (1985, p. 294).

Bounded rationality is a way of focusing on the use of a reasonable process that helps to compensate for the limits of human rationality. And to avoid any misconceptions, Simon also contends that bounded rationality is not equivalent to irrationality. Objecting to the quality of choices or even the information that informed a decision is not the same as saying irrationality has prevailed. Individual decision makers do have goals and strive to make the best choices possible under the circumstances, which is another way of saying that they are “intendedly rational” (e.g., March & Simon, 1958, p. 170). Finally, Simon reminds us that bounded rationality has intellectual roots in psychological theory, specifically cognitive psychology. To Simon, cognitive psychology has a good appreciation of how individual choice making is limited in its computational abilities and involves a realistic understanding of individual problem-solving processes.

The Legacy of Bounded Rationality

The bounded rationality concept has figured prominently in political science, including influencing Lindblom’s incrementalist theory of rationality. Bounded rationality is a robust concept that lends itself readily to multiple meanings and applications, and it continues to play a role in how political scientists frame rationality. To illustrate, Jones (2003) evaluates the contributions of bounded rationality in public administration and public policy scholarship and argues that the bounded rationality approach has yielded an enhanced understanding of how government organizations may produce unexpected or even unpredicted policy or program results. With public organizations not operating under full rationality conditions, administrators aspiring toward rationality may nonetheless find their goals undermined by a variety of forces, such as informational uncertainties and nonrational elements of organizational decision making.

Bounded rationality also plays an important role in Allison’s (1971) three decision-making models for studying the Cuban missile crisis: rational policy, organizational process, and bureaucratic politics. The first and second models are most relevant to this chapter. Model 1 (rational policy) is Allison’s version of the economic rationality model, with assumptions of advance specification of goals and objectives; identification and evaluation of a range of options; clear-headed knowledge of consequences of decision alternatives, particularly with respect to costs and benefits; and finally selection of the best option from the standpoint of value maximization. This model conceptualizes decision making by the U.S. government as a unified national actor coolly mapping out a set of different alternatives for careful, deliberate evaluation—major options such as doing nothing, diplomatic pressures, a surgical air strike, or a blockade. Model 2 (organizational process) focuses on organizational processes and outputs, seeing U.S. decision making as the result of complex bureaucratic

properties. Simon's satisficing concept is evident in Allison's argument that decision making in Model 2 involves "sequential attention to goals" (p. 82). Bounded rationality also is evident in Allison's emphasis on "standard operating procedures" and "programs and repertoires" (p. 83) that coordinate the activities of individuals in government departments and agencies. These latter principles serve as the basis for Allison's much quoted examples of how organizational procedures and constraints may come to shape decision making at the highest levels of a presidential administration. Perhaps the most widely cited rationality example from Allison is Secretary of Defense Robert McNamara's argument for a political and internationally sensitive approach to blockade implementation, as opposed to admiral George Anderson's reluctance to deviate from the Navy's standard operating procedures for blockade placement.

Some scholars, however, have suggested that there may be problems with Allison's application of his decision-making models. To illustrate, Bendor and Hammond (1992) criticize Model 1 as unduly simplistic in its version of rational choice, and they contend that Allison has misinterpreted and misapplied bounded rationality theory. They argue that Allison's version of bounded rationality misinterprets Simon by viewing organizational structure, processes, and routines as a hindrance to quality decision making. Organizational properties such as standard operating procedures really are positive features in Simon's bounded rationality, by facilitating and assisting the decision-making process: In essence, complex challenges and difficult choices require that rationality be boosted through organizational processes, including processes as seemingly mundane as standard operating procedures. Organizations do not limit rationality; they facilitate rationality.

The Foundations of Rational Choice

The roots of modern rational choice theory generally are traced to the seminal contributions of a group of economists—primarily Arrow, Downs, Buchanan and Tullock, and Olson—and one path-breaking political scientist—Riker—through the 1950s to mid-1960s (e.g., see Almond, 1991; Ordeshook, 1990). Some scholars note the early formative role of social or economic philosophers such as Thomas Hobbes and Adam Smith (Monroe, 2001). Kenneth Arrow's (1963) social-choice approach to rationality is a good place to start. First developed in the early 1950s, it has contributed to decades of theory and research on the question of whether individual and collective rationality are inherently in conflict in democratic society. Individual rationality as indicated in expressed preferences might generate problematic collective social choices that lead to serious questioning of the possibility of coupling rationality with democracy—that is, without dictatorship to force choices on people. This puzzle is covered in

rational choice investigations of what generally is identified as the *possibility theorem*, or alternatively the *impossibility theorem*.

Anthony Downs's (1957) *Economic Theory of Democracy* is arguably the most important contribution from someone who is not a political scientist to rational choice in political science. While exploring the meanings of economic and political rationality, Downs presents a theory of rationality in which individuals in political and governmental arenas are guided by self-interest as they pursue choices with the highest levels of utility. The concept of utility figures prominently in economics and is a general way of summarizing the benefits choices bring to decision makers, and the utility concept makes regular appearances in the rational choice literature of political science. To Downs, benefits are not limited to a narrow monetary or financial nature; utility also may be derived from government services such as policing, water purification, and road repairs.

Downs is particularly well-known for his propositions on how self-interested voters assess the appeals of rationally oriented political parties in democratic political systems. These voters may also experience degrees of uncertainty and even information gaps, somewhat similar to what occurs in bounded rationality conditions. Kenneth Shepsle and Mark Bonchek (1997), coauthors of the standard text on rational choice, note the importance of Downs in spatial modeling to show how rational voters evaluate the merits of politicians and electoral candidates in ideological space. Governments themselves figure in Downs's analysis because government officials and political parties seek to maximize support from voters—for example, through spending on government programs or offering programs that appeal to voter self-interest. According to Downs (1957), governments are run by self-interested individuals whose primary concern is not an abstract ideal of social welfare maximization or the public interest; they are oriented toward developing government programs in relation to strategies to please voters.

James Buchanan and Gordon Tullock's (1962) *Calculus of Consent* presents a rationality model in which individuals choose according to the "more rather than less" principle (p. 18). The average individual seeks to maximize utility and secure more of what he or she values—rather than less of it—in the political arena as well as elsewhere. Buchanan and Tullock are particularly interested in the relationship between individual and collective rationality. Although they acknowledge that rationality in market-based decision making does not hold up as well in the governmental setting, they nonetheless argue for applying the logic of economic-based decision making to democratic political systems. Rational members of democratic society will decide in favor of political organizations and institutions that serve their respective individual interests, with competition among individuals also evident in this process. This competition becomes manifest as rational

individuals in constitutional democracies pursue more rather than less for themselves in the political arena. Although there may be some slippage from the full rationality standard regarding information levels of individuals and even the extent to which self-interest may dominate, Buchanan and Tullock confidently assert that “each participant in the political process tries, single-mindedly, to further his own interest, at the expense of others if this is necessary” (p. 305). Furthermore, individual choice plays out in an existing constitutional system—for example, the institutions, processes, and rules of representative democracy. In this sense, Buchanan and Tullock embrace a version of bounded rationality in that constitutional democracy also sets the boundaries for political choice.

Mancur Olson’s (1965) *Logic of Collective Action* represents a major challenge to traditional thinking on individual participation in groups in democratic society. Rational individuals may not have an incentive to join or participate in large voluntary associations, particularly those characterized as “latent” groups, if they can benefit from the collective or public goods provided by these groups without having to pay dues or incur other costs of membership (pp. 58–59). A key element of Olson’s approach to rationality concerns the “objectives” pursued by individuals. Olson pointedly makes the following observation:

The only requirement is that the behavior of individuals in large groups or organizations of the kind considered should generally be rational, in the sense that their objectives, whether selfish or unselfish, should be pursued by means that are efficient and effective for achieving these objectives. (p. 65)

Rational Choice Arrives in Political Science

William Riker’s (1962) *Theory of Political Coalitions* is probably the most important scholarly work in the emergence of rational choice in political science. Riker takes the theories of economics and mathematics-based game theory and expressly applies them to political decision making, presenting an alternative to political science’s long-standing focus on concepts such as power and authority. Riker sees rationality in terms of individuals who seek to win, rather than lose, in the context of various types of two-person games: “Politically rational man is the man who would rather win than lose, regardless of the particular stakes” (p. 22).

Whether considering topics such as voting choices or federal system design, Riker (1990) conceives of political rationality as involving actors who are “able to order their alternative goals, values, tastes, and strategies” and who “choose from available alternatives so as to maximize their satisfaction” (p. 172). In Riker we see the fusion of the rational actors of game theory and economics, transposed to the world of politics and government. Riker, however, sees his approach to rationality as transcending traditional arguments over pure economic and bounded rationality. The focus of rational choice theory should be on how

individuals decide with information available to them, from knowledge of their own preferences or through the consequences of alternatives themselves. His definition of rationality “requires only that, within the limits of available information about circumstances and consequences, actors choose so as to maximize their satisfaction” (p. 173). Riker became one of the most controversial figures in modern political science, arguing for political science to openly embrace rational choice as its future, particularly because “in contrast to economists, political scientists frequently have been methodically unsophisticated” (p. 178).

Riker’s approach to studying politics illustrates prominent features of modern rational choice. First, there is the common use of what may be called the “as if” assumption of rationality to guide empirical analysis and research (e.g., Moe, 1979). Individuals are assumed to act “as if” they decided according to principles such as utility maximization and the pursuit of self-interest (see Riker & Ordeshook, 1968), and then researchers go about the process of testing their propositions and hypotheses against empirical reality. The “as if” approach in rational choice theory has prompted great debate over rational choice’s approach to knowledge in the social sciences, with one writer exploring tensions between “instrumentalist empiricism” and “scientific realism” in rational choice scholarship while asking whether the “as if” assumption approach represents a “useful fiction” (MacDonald, 2003).

A second feature is the tendency of rational choice practitioners to work out anomalies or counterevidence from within the rational choice tradition itself—that is, to focus on what some refer to as the maintenance of core elements of the rational choice theory as a way of explaining political reality—even in the face of potentially confounding data or developments (e.g., Shapiro, 2005). To illustrate, Riker and Ordeshook (1968) addressed the puzzle that voting itself might be an irrational act when considering individual costs and benefits; they find that there really is an underlying rational calculus to the decision to vote—or for that matter not to vote.

A third feature of rational choice is its ongoing evolution, as we would expect of any healthy scholarly approach. The rational choice of recent decades is not the same as that of the 1960s and 1970s. In Riker, this is seen in his devotion in the latter part of his career to a scholarly approach labeled *heresthetics*, which focuses on the strategic use of communications, such as sentences and languages, by political leaders and elites in important arenas such as agenda control and coalition formation (Shepsle, 2003).

Understanding Contemporary Rational Choice Theory

Rational choice theory draws from the general approach called *rational actor theory*, which Monroe (1991) identifies as emphasizing individuals who pursue goals and decide among competing alternatives while possessing extensive information, a coherent preference ordering, and a commitment to the principles of self-interest and utility

maximization. Rational choice theorists, however, at times differ on how they incorporate these properties into their assumptions and empirical research. A major example is the distinction between *thin* and *thick* rationality. The thin version is the elemental approach to rationality that operates at a fairly broad level, not going much beyond general-purpose assumptions such as characterizing individuals as goal oriented, self-interested, and seeking utility maximization. A thickened version of rationality builds additional specifications into the rationality model—for example, actual belief systems, psychological needs, aspiration levels, cultural values, and even specific goals that may be important in the sociopolitical arena (e.g., see Ferejohn, 1991; Friedman, 1996). Rationality thus becomes richer or more substantive as it is thickened. The importance of understanding this distinction is underlined by Ostrom (2006), who criticizes the tendency in political science to “lump all scholars together who use a thin model of rationality together with those who are developing second- and third-generation behavioral theories” (p. 8).

A few examples from within rational choice scholarship illustrate efforts to broaden its framework and scholarly focus, particularly through the study of institutions. Shepsle and Barry Weingast (1994) assess the transition from the first generation of rational choice congressional research, which fused a behavioral orientation with a strong focus on majority cycles coupled with a relatively abstract notion of the legislature. The second and third generations of rational choice research on Congress, however, shifted toward incorporating institutional structure variables—such as committees, subcommittees, and their rules—along with parties and leadership in the postreform era. Terry Moe (2005) provides a critique from within rational choice that although supportive of the promise of rational choice for political science nonetheless calls for a much more substantial role for political power in rational choice and its study of institutions—in settings that range from the U.S. bureaucracy on through nation-to-nation interactions in international politics.

Richard Feiock (2007) develops a set of hypotheses on regional governance institutions based on what he identifies as a “second-generation model” that incorporates contextual factors that shape and underpin individuals as rational actors. A thin version of rationality is set aside, and contextual factors show how rationality may be bounded—and thus provide an example of integrating bounded rationality into modern rational choice. An excellent example of this synthesis is found in George Tsebilis (1990), who argues that rational choice has unique qualities in its ability to explain behavior of rational actors in the context of political and social institutions that establish the rules of the game in which individuals assess their options and seek utility maximization. Tsebilis’s embrace of a rational choice that is bounded by institutional setting is particularly interesting in view of his application of it to comparative political analysis.

To this point, rational choice has been presented in a summative way to introduce the reader to its roots and key

influences while providing some sense of its present concerns. It must be noted, however, that any survey of rational choice runs the risk of oversimplification, and the student may be wise to consider the statement by one well-known rational choice practitioner:

I suspect the only thing all RC [rational choice] people would agree upon is that their explanations presume that individuals behave purposively. Beyond that, every manner of disagreement theoretical, substantive, methodological can be found. RC is an approach, a general perspective, within which many different models can be located. (Fiorina, 1996, p. 87)

In addition, the undergraduate student with an interest in rationality will encounter multiple references to the public choice, social choice, and rational choice schools, and these terms often are used interchangeably—either accurately or inaccurately (e.g., Friedman, 1996; Monroe, 1991). Within political science, the term *public choice* certainly has definite connotations, primarily due to its association with a well-known political science couple, Elinor and Vincent Ostrom, whose unique and influential versions of rational choice theory and research have been identified by some as the *Bloomington school* (Mitchell, 1988). Illustrative of the sometimes tricky terrain, the term *public choice* may also represent a general ideological orientation to some political scientists who view public choice as having limited application to the discipline. These political scientists contend that public choice is too closely associated with a market-based model that ultimately sees politics and government as hindrances to individual and collective welfare. In sum, rational choice is a multifaceted subject with different schools of thought and even the potential for stirring some emotions.

Rational Choice Controversies

A full understanding of rational choice requires knowledge of controversies associated with this approach in the political science discipline. The decade of the 1990s represents a key turning point, with the emergence of open and occasionally heated debate over the value of rational choice to political science. This decade includes Donald Green and Ian Shapiro’s *Pathologies of Rational Choice Theory* (1994) and subsequent scholarly exchanges such as those in *The Rational Choice Controversy: Economic Models of Politics Reconsidered* (Friedman, 1996). A survey of some representative criticisms from this era captures the intensity of this debate:

• Gabriel Almond (1991) asserts that the economic model of rational choice neglects scholarship in disciplines such as sociology, psychology, and anthropology, and its assumptions of human rationality, with their emphasis on utility-maximizing behavior, produce a conception of human rationality that has no “substantive content” and is akin to the Scrabble blank tile that “can take on the value of any letter” (p. 49).

- Green and Shapiro (1994) skewer rational choice as fundamentally flawed, both theoretically and methodologically. Although noting that it has constructed sophisticated formal mathematical models, they contend that the value of rational choice to political science is undermined by a set of deep-seated social scientific pathologies—for example, its theory-driven research with little interest in solving real political questions or problems and its research results that “do little more than restate existing knowledge in rational choice terminology” (p. 6).

- Stephen Walt (1999) criticizes rational choice’s growing reliance on formal modeling, highly sophisticated mathematical analysis, and game theory applications, which he sees as not enhancing international security studies—with “rigor mortis” the more likely scholarly result than methodological “rigor.”

The rational choice debate carried over into the first decade of the 21st century, though the intensity level of the debate certainly has waned in recent years. The Perestroika movement, which borrowed its name from the reform era of the Soviet Union, probably was the most significant development in the rational choice debate of the past decade. The year 2001 witnessed a multipronged effort by a coalition of disenchanted political scientists to reform the American Political Science Association and redirect political science scholarship in general.

The Perestroikan critics of the political science establishment grouped rational choice with formal modeling and quantitatively oriented research as they made their case against a style of political science perceived as actually diminishing genuine knowledge of government, politics, and policy. Perhaps the most colorful statement to represent the emergent criticism of rational choice is the following call to arms:

William Riker was fond of saying that political science was a sinking ship, and rational choice theory was the only tugboat that might bring it to port. It is truer to say that Riker’s disciples have acted as pirates out to hijack political science to a rather barren island. Their piracy is doomed to fail. (Kasza, 2001, p. 599)

While the early fervor of the Perestroika heyday eventually dissipated, additional critiques of rational choice later emerged in an edited volume with the colorful title of *Perestroika! The Raucous Rebellion in Political Science* (Monroe, 2005). While rational choice was not by any means the sole object of attention of this volume, rational choice took its lumps from some high-profile political scientists such as Theodore Lowi and Samuel Beer.

Toward Reconciliation

It has not been all slings and arrows over the past decade. A case in point is the assessment provided by a

scholar with a well-established record of questioning rational choice and who also has argued for an alternative framework rooted in political psychology—*perspective theory*, which focuses on identity at the individual, group, and societal levels. Kristen Monroe (2001) argues that the discipline “has wasted too much time debating the merits of rational choice theory” and that it is time to focus more fully on asking “what we have learned that may be utilized in the next stage of constructing more realistic theories of political life” (pp. 165–166). Ostrom’s (2006) framing of the issue as “Rational Choice—An Evil Approach or a Theory Undergoing Change and Development?” (p. 8) also merits consideration. While embracing the value of rational choice as part of a diverse modern political science and certainly not seeing it as an evil approach, she nonetheless acknowledges, as a rational choice practitioner herself, that factionalism in today’s political science may have multiple sources, including rigid adherence to a narrow definition of rationality: “Some of the factionalism does stem from the arrogance of those who consider the continued use of a narrow model of human rationality the essential qualification for doing good social science” (p. 8).

Conclusion and Disciplinary Directions

The past 50-plus years have shown great interest by political scientists in the meaning and applications of rationality. Lindblom’s incrementalism ushered in an era of theory and research on the limits of rationality in crafting and choosing public policies, and Wildavsky expanded on incrementalist theory as he made the case for political rationality over economic rationality. Simon’s seminal theorizing contributed greatly to knowledge of the realities and parameters of rationality by arguing that there are limits on decision-makers’ abilities to acquire and process information and assess options. Rationality is circumscribed or limited, with bounded rationality the condition of individuals as they make important political, policy, and administrative choices. Starting with Riker, rational choice theory elevated the question of whether political actors—from voters on through institutional actors such as political parties, elected officials, government bureaucrats, or even nation-states—are motivated primarily by an economic-based sense of self-interest and utility maximization. Rational choice political scientists answered in the affirmative to this question as they drew from scholars such as Downs, Olson, and Buchanan and Tullock—all of whom cut their academic teeth in the economics discipline. With political scientists such as Riker and the Ostroms laying the foundations, rational choice would become an important force in the discipline.

Alternative conceptions of rationality have spurred debate among political scientists, including expressions of resistance to the notion that politics and government may be understood through the prism of an economics-oriented model of individual and organizational decision making

and behavior. Scholars such as Lindblom, Wildavsky, and even Allison questioned the value of seeing policy making and government decision making as tightly structured processes of high-end rationality. Critics of rational choice argued against a political science that reduced the political arena to self-interested, utility maximizing political actors who could be studied through heavily assumption-laden theories and methodologies that make extensive use of formal modeling. Rational choice practitioners, however, have defended their scholarly approach while asserting that rational choice is not a monolithic enterprise, with scholars marching in lockstep. In response to criticisms of early versions of a stripped-down rationality, known alternatively as thin rationality, second- and third-generation versions of rational choice have emerged to incorporate more nuanced and developed understandings of rationality in politics and government—such as adopting bounded rationality assumptions and paying attention to the impact of institutional or cultural variables such as legislative rules and traditions.

Although the dialogue over rational choice has been animated and sometimes heated, it ultimately has been beneficial to modern political science. From the multipronged criticisms of rational choice theory, methodology and research voiced by Green and Shapiro in the 1990s on through the sometimes heated debates of the Perestroika movement at the dawn of the new century, political science certainly has indicated a willingness to address fundamental issues and questions. For example, what drives or motivates individuals or government officials to action? Are they fundamentally self-interested? Or are they capable of placing the public interest over personal, economic-oriented calculations of benefit or utility? What of the impact of social-psychological factors such as emotions, values, and identity? Is the political arena best understood as a venue explained by the basic concepts and tools of economics? Just how much information can political actors handle when making a decision—such as whether to vote for a candidate, align with a political party or ideology, express support for a public policy, or evaluate the performance of government officials? All these intriguing questions figure in the study of rationality in political science, and they no doubt will continue to shape future generations of theory development and empirical research.

Note: For building a foundation in rationality studies, the following sources will be particularly helpful to students: Downs, *An Economic Theory of Democracy* (1957); Monroe, *The Economic Approach to Politics: A Critical Reassessment of the Theory of Rational Action* (1991); Friedman, *The Rational Choice Controversy: Economic Models of Politics Reconsidered* (1996); and Shepsle and Bonchek, *Analyzing Politics: Rationality, Behavior and Institutions* (1997). Advanced students of rationality in political science should consider Ostrom's *Understanding Institutional Diversity* (2005), in which the 2009 Nobel Prize winner and public choice proponent grounds nuanced rational choice premises in social, economic, and political settings that include bounded rationality, the impacts of institutional rules and procedures, collective decision-making processes, game theoretic strategies, and community characteristics. A shorter and more focused version of this approach can be found in her 2007 survey article "Institutional Rational Choice," dealing with its use in public policy research. Ostrom's scholarly effort is part of what she calls the institutional analysis and development framework that already has been applied by a variety of scholars to real and challenging policy problems such as land use conflicts and common pool resource exhaustion problems (e.g., deforestation and soil erosion).

6

PRINCIPAL–AGENT THEORY

JOHN JAMES QUINN

Truman State University

Imagine the worst happens, and you are falsely accused of a crime in a city in which you are vacationing and in which you do not know anyone. You are arrested and advised of your rights to an attorney and one phone call. Which lawyer do you call? Which lawyer has the best training in the type of issues for which you were arrested? Which one has the best record on these matters? Which one can you afford? Will the one you pick work hard for you? Or will you choose one that will do only a minimal job, which could land you in prison? How can you make the best and most rational decision with this lack of information?

Few people in this situation would have enough information concerning which attorney has the appropriate training or which is the most dedicated to clients. However, any lawyer contacted would know these things about themselves. This asymmetry of (or differences in access to) information constitutes one of the key elements of the *principal–agent* problem. It is also called the *adverse selection* problem.¹ You have to hire someone with only limited information concerning his or her qualifications, training, and achievements. Moreover, potential agents have an incentive to overstate their abilities and experiences in order to obtain the commission.

In addition, you and your lawyer have some interests in this case that are different. You may want your lawyer to dedicate the next several months of his or her life to your case. Your lawyer, by contrast, may want to

spend the minimum amount of time possible on your case, get paid, win if possible, and pursue other interests. This highlights another aspect of the principal–agent problem: *moral hazard*. Agents and principals often have competing self-interests, despite the fact that the agent is hired specifically to represent the interests of the principal. The agent (the lawyer in this case) could put his or her interests ahead of the principal's (you in this case) by taking payment and not putting forth a strong effort. However, to be fair, unless the lawyer insists on payment up front, he or she runs the risk of doing a great job and then not being paid appropriately afterward.

Finally, your lawyer may recommend a course of action (e.g., plead innocent, take a plea bargain) that you cannot adequately analyze, given your inexperience with the law. You do not know the judges, the law, or past outcomes in similar cases. Lawyers should, and this is why they are hired. However, an incompetent lawyer will recommend a strategy with the same confidence as a well-qualified lawyer. This is also an aspect of the adverse selection problem. You would have to hire an additional lawyer or law firm to determine fully the quality of the strategy being employed. This asymmetry in knowledge and expertise between the people who could enter into a contract lies at the heart of the principal–agent relationship. (Otherwise, you could represent yourself in court and forgo hiring an agent to handle your business.)

Another common situation in which one can see this paradigm at work arises in the personal housing market. Imagine you want to buy a house in a new city and engage a real estate broker. This person has knowledge that you do not have (e.g., the quality of different neighborhoods, the quality of schools, how quickly homes sell, the quality of the contractors, the process of buying a house in that locality), and for this knowledge you hire the broker to become your agent. Typically, agents get some set percentage of the price of the house once it is sold. So when the agent discovers your top price, he or she may tend to show you the houses that are at the top, or slightly over, your price range. Why? The agent has a personal interest in selling you the most expensive house you can afford because he or she will make more money from that sale than from a house that sells for less; 6% of a higher number is more than 6% of a lower number. Your self-interest is in paying the least you possibly can for a house that gives you the most value. The agent may be better off (in a narrow sense) if you buy a house you cannot afford, as long as the deal goes through. If you have to sell your house because you cannot afford it, the agent loses nothing, and he or she might even be able to resell the house and earn money again. However, if the agent is concerned about reputation, he or she may strive to get you into an affordable house so that you pass on good reports to other potential clients.

That Person A would hire Person B to do the bidding of Person A and that their relationship is bound by a contract are well established in history. So too is the idea that the agent has some normative, legal, or moral obligations to do what is in the best interests of the principal. In legal terms, the agent has a *fiduciary obligation* to the principal. In fact, the principal-agent relationship is a key concept of British common law and in the field of law generally, where it is called *agency*. This idea of agency is therefore pervasive in society. According to Ross (1973), "All contractual arrangements, as between employer and employee or the state and the governed . . . contain elements of agency" (p. 134).

To understand the contemporary use of this approach in the social sciences, one must turn to political economy (Ordeshook, 1990). The principal-agent relationship, or agency, exists at the intersection of economics, political science, business, law, finance, and sociology. It is used as a heuristic tool to understand economic, social, business, or political relationships using self-interest as a guiding principal. This approach uses some, but not all, of the assumptions of microeconomics: that human interactions are best understood as a meeting of two self-interested and rational actors with relatively fixed preferences trying to maximize their own utility—but both of whom have less than complete information.

In political science, the principal-agent relationship is usually studied by rational choice scholars. The rational choice paradigm uses economic assumptions of human

nature to study political outcomes. As such, rational choice scholars begin with assumptions of rationality as well as the maximization of (relatively) fixed goals. These are the *strong* assumptions of rational choice. For example, the assumption of wealth maximization often translates to power maximization or reelection for political leaders (Levi, 1997). It also includes several weaker assumptions, including no information costs; no transaction costs; no collective or organizational costs; no transportation costs; and no role for history, institutions, or culture. There are simplifying assumptions that are not true, per se, but they are held to be true for the parsimony of the model. However, some authors do not include all of the assumptions (or they lift or "assume away" one assumption or another) and examine the likely outcomes of no longer having all the simplifying assumptions in the model. However, different scholars have examined political interactions and have lifted one assumption or another. Olson (1965), for example, lifted the assumption of collective action costs to show how by reintroducing these costs, one could predict more realistic political outcomes than before.

Therefore, the principal-agent paradigm is used to describe situations in which information costs, which are normally lifted or assumed away in microeconomics, are reintroduced, along with risk sharing or risk shifting. In the same way that physicists assume away friction to describe "ideal physics," so do economists sometimes assume away these other costs of exchange. However, the principal-agent paradigm retains the strong rational choice assumptions of self-interest on the parts of both the principal and the agent, as well as their relatively fixed preferences. The inclusion of transaction costs results in both *adverse selection* and *moral hazard* (Moe, 1984).

Let us explore in more depth the key elements of adverse selection and moral hazard in the principal-agent paradigm. An illustration of adverse selection may be seen when applicants for a position claim greater skills or work habits than they actually have, believing that these personal attributes are difficult for potential employers to know. Prospective employees (agents) have the incentive to exaggerate their abilities (or pad their résumé) to get their foot in the door, and then they quickly learn the skills after being hired. The firm doing the hiring (the principal) wants to hire someone already qualified and who brings these skills along. However, the principal can determine only imperfectly whether a prospective employee actually has these attributes or is exaggerating.

The moral hazard aspect of the principal-agent relationship usually occurs after a person is hired and when the amount or quality of work performed (or output) is difficult to measure or monitor. For example, if a contractor (i.e., agent) is building a house for you in your town, you can stop by the site and witness the various parts of the house being constructed. If, however, you hire an agent to manage a plant in a distant state, you would have to spend

more time and resources to visit that factory. Moreover, if the agent knows when you are to arrive, he or she can look busy during the visit and hide low productivity.

In addition, even with supervision, sometimes output is inherently hard to measure. For example, if a teacher has many students who do poorly on performance tests, who should be held accountable? Should one blame the teacher who was unable to motivate otherwise “good” students? Or should one blame the “underachieving” students who did not appreciate the high quality of the education they were receiving? In addition, should pay be linked to student outcomes? Similarly, should a car salesperson with a slow month be blamed and seen as a slacker? Or could the salesperson have been quite diligent, but the market turned against him or her that month?

Classic Views of the Principal–Agent Relationship

According to Miller (2005), the canonical or orthodox principal–agent relationship is marked by several key ideas. First, the actions of the agent affect the wealth or well-being of the principal, so the principal is expecting some payoff (reward or punishment) arising from actions of the agent. Second, information asymmetries exist, and the agent has special knowledge or abilities, the lack of which keeps the principal from doing the job himself or herself. In addition, the principal can learn of the efforts of the agent only with difficulty or at a high cost. Third, the principal and agent are assumed to have some preferences that differ. As mentioned above, the agent usually wants the most pay for the least amount of work, and the principal wants the biggest reward (or smallest penalty) with the least payment to the agent. The employee–employer relationship provides a classic example. Another aspect of different preferences is that the agent is usually risk averse whereas the principal is considered risk neutral. To understand this, imagine someone offered two different jobs selling cars, one that pays purely on commission and the other that pays a base rate plus a much smaller commission. Even if the expected income were higher at the commission-only job, the risk-averse agent would likely pick the job with the base pay. Risk-neutral people would maximize their income by taking the commission job because its potential for earning money is greater.

Fourth, the initiative for creating a contract lies with a unified (single) principal. When the principal engages the agent, the principal sets the terms of the contract, to which the agent agrees or not. Fifth, both agent and principal know the basics of the process in which the agent will be engaged. Although a principal may not be able to monitor directly how much work an agent does, the principal is assumed to know the results of the agent’s work, which can be used to infer the efforts of the agent. This is called *backwards induction*—assuming high efforts on the basis

of good outcomes and low efforts on the basis of poor outcomes. Information about the shape of the game and the outcomes of the work of the agent are inexpensive to obtain. Last, the principal can set the specifics of the contract, which include the incentive structure for the agent. The principal, using logic, can determine the best contract to obtain the most wealth from the agent, given the first five elements of the relationship between principal and agent.

Therefore, the principal–agent dilemma exists when a principal wants to hire an agent, but given the self-interest of the agent, as well as the agent’s unknown qualifications, the principal’s choice could lead to poor performance on the agent’s part, thereby harming the principal. The principal therefore tries to create a contract, or payment system, such that the agent acts on the principal’s behalf. In other words, their economic interests are aligned through a contract that shapes incentives.

As a result of the above elements of the principal–agent model, the rule of thumb for the relationship is that where the costs of monitoring the agent are high (and the agent is risk neutral), the principal creates a contract that links payment chiefly to outcomes rather than making trips to monitor the agent or devising complex systems of accountability. For example, in the case of civil law, plaintiff lawyers are often paid with contingency fees and only when the outcome is a successful verdict. If the lawyer (agent) does not win the case, then he or she is not paid. For many in sales, some commission system is usually found, often on top of a small salary, given the risk-averse aspect of the agent. Finally, CEOs are often paid some mix of salary and stock bonuses that align their interests with the price of stock shares; in other words, the agent’s interests become aligned with the owners’ (stockholders) interests in higher stock prices.

Where it is relatively easy or low in cost to monitor the actions of the agent (or where the agent is particularly risk averse), then payment is tied to efforts and not outcomes. In fact, many people are paid by the hour because their employers share the view that time at work results in desired outcomes. For example, a mechanic or carpenter who hires an assistant can easily monitor the efforts and quality of work put forth by the assistant. Therefore, the mechanic or carpenter can pay the assistant by the hour without significant adverse selection and moral hazard effects.

Much of the literature on principal–agent theory examines the types of contracts that are optimal under different levels of risk and transaction costs. The dependent variable is the optimal or second-best contract designed by the principal and imposed on the agent. Many authors explore how transaction costs affect the type and nature of the contract created. Much of this literature uses complex mathematical models and proofs to arrive at conclusions.

A leitmotif running through these ideas is that a contract creates incentives that can align the interests of the agent

with those of the principal. Within economics, the principal–agent approach originated in the context of insurance and credit markets and examinations of how principals can extract rents from agents (Stiglitz, 1987). Since it is assumed that the principal has control over the contract, a rent-extracting agent is not usually modeled.

According to Jensen (1983), there are two basic strands of principal–agent theory. The first is a more empirical, or positive, approach, often called the *positive theory of agency*. This approach attempts to arrive at testable hypotheses derived from the particular assumptions of the model (such as the six described above). This approach is more often seen in political science. The positive theory of agency can also be used as a case-illustrative approach to explain phenomena unexplainable by other paradigms or models. The second strand of this literature is economic in orientation, with formal modeling and advanced mathematics used to make predictions about which contracts would be the most efficient under various conditions. It is often called, *tout court*, principal–agent. It is highly formalistic and mathematical, and rarely empirical.

However, especially on the agency side of the approach, one understands that contracts made between agents and principals occur in a broader societal context than a one-time negotiation resulting in a contract. Government institutions, or regulations, create background conditions in which negotiations or contracts are constructed, especially through the regulation of socially recognized agents. For example, each state in the United States regulates lawyers and empowers the state bar to ensure that each lawyer has met minimum qualifications. If, indeed, determining the quality of any particular lawyer involved no information costs, then making lawyers pass the bar examination would be needless—one would know ahead of time which lawyers were prepared and which were not. But since information is costly, and the potentially harmful societal effect of poorly trained lawyers would be great, the government regulates this market. With the requirement of passing the bar, the chances that a lawyer will have little or no training are much lower. These sorts of regulations establish a floor, rather than a ceiling, for these interchanges. Similarly, medical doctors have to pass exams to practice medicine. Finally, teachers are certified in nearly every state for employment in the public schools: They must take a minimum number of hours in education courses from a credentialed school of higher learning. Each state's requiring potential agents to have met minimum qualifications reduces, but does not eliminate, adverse selection problems facing potential principals. Government can also regulate food quality, water quality, and more to ensure the smooth working of markets under conditions of transaction and information costs.

Similarly, but expanding beyond the narrow principal–agent problem, both government and private institutions can be seen as forms of megacontracts, or the guidelines under which other contracts are written. Some argue that

institutions arise precisely because of information and transaction costs (which give rise to the principal–agent dilemma). As discussed above, the solution to the principal–agent problem is found in the contract itself. Some suggest that most organizations “serve as a nexus for a set of contracting relationships among individuals” (Jensen & Meckling, 1976, p. 310).

One of the pioneers in transaction costs, Ronald Coase (1937), held that the rise of the contemporary business firm—which dominates the landscape of U.S. business—makes sense only when one accounts for transaction and information costs. The existence of these firms would be illogical if these costs were truly zero. Why have an economic institution dedicated to the production of various elements for some product when one could costlessly contract out all the subcomponents? Given the lack of complete information on quality, performance, punctuality, and price for each subcontractor, adverse selection and moral hazard necessarily arise, and these problems have been solved by the evolution of production within a firm where relations were based on hierarchy and authority instead of only price.

As such, formal hierarchical organizations can be used to improve monitoring to reduce moral hazard and create incentive structures, or contracts, such that agents perform the duties expected of them by the principals. Where monitoring is difficult, the contract can employ “proxy” measures of actual quality instead of quality itself (Moe, 1984). Some examples are hours worked, products produced, and sales completed. However, where these things are difficult or costly to measure, others are hired to monitor the work of employees. Therefore, supervisors in stores who are not stocking shelves or sweeping floors are there to make sure that those employed to do so, do so. Lower-level management in firms is hired to monitor employee performance. And, in turn, midlevel management monitors lower-level managers.

Similarly, Williamson (1985) examined economic institutions to see how they form economic incentives that shape human behavior. In fact, Williamson suggests that the principal–agent relationship is a subcomponent—along with property rights (e.g., North, 1981)—of the literature on transaction costs, which looks at incentive structures to explain outcomes. The other branch of the literature on transaction costs examines institutions that rely on non-market governance and measurement to have economic outcomes. Williamson claims that traditional microeconomic theory falsely views all deviations from “pure market behavior” to be caused by monopoly. Ironically, economic institutions reduce the very transaction costs (prices and premiums for risk, uncertainty, bargaining, and obtaining information) that are assumed away in traditional microeconomic theory. Jensen and Meckling (1976) suggest that organizations themselves are actually multi-lateral contracts between and among many principals and agents—thus bridging the principal–agent literature with

neoinstitutional ideas. Therefore, the incentives found in contracts are also found in institutions.

Although not all principal-agent relations examine institutions and their roles, one can see how, empirically, society has helped to overcome information costs and make markets operate “as if” information costs were low or nonexistent. Institutions can also play a role in shaping incentives between principals and agents, which act as a form of contract. Therefore, contracts can be seen as more concise versions of institutions, and institutions are longer established rules and norms that create incentives—which in turn shape the interchange between principal and agent.

In addition, private companies can help reduce uncertainty and thereby lower information and transaction costs for consumers if doing so helps private companies move product. Imagine that a new car company with no record of accomplishment wants to enter the market. In order to reduce the risk to the customer, the car company can give a warranty that the car will perform well for X number of miles, or X number of years. So even if the car proves to have many mechanical problems, the customer is somewhat protected from the lack of information before the purchase of the car. This should lower customers’ risk of purchasing a new product that does not yet have a record of accomplishment (and thus less information about quality).

Firms also realize that potential customers incur information costs in making decisions. For example, firms that win awards for quality or safety will highlight this in their advertisements as a form of external verification for otherwise ubiquitous claims of quality and performance. Knowledge of the awards reduces the risk, or uncertainty, the client faces, because uncertainty results from gaps in information. Some information, such as the life span of any particular car, is unknown to both seller and buyer, although the car salesperson has a better probabilistic understanding of how well the different models of cars he or she sells will perform.

Political Science

In early political science, Max Weber identified a construct similar to the principal-agent perspective when he discussed the state and sources of authority. He argued that there are three key constituencies in a state: (1) the power holders, (2) their servants (the bureaucracy), and (3) the population (Lane, 2008; Weber, 1978). One can apply the principal-agent relationship to the state and think of the population as the principal and the power holders as the agents (Lane, 2008). Alternatively, one could think of the power holders as the principals who have to monitor the bureaucracy, who are the agents. An example would be congressional oversight of bureaucracies (Weingast, 1984).

However, some might argue that thinking of the population of a country as the principals and officeholders as the agents could be problematic for several reasons. First,

do all the principals have a unified interest that the agents can understand? In fact, no matter what politicians do, one could argue that they are responding to some societal demands while ignoring others. Therefore, the lack of a clear and unified principal could make the application of this paradigm to politics more difficult. Moe (1984) discusses the difficulty of analysis with multiple principals.

One possible exception to this problem may be the case of corruption. Several scholars have used the principal-agent model to describe corruption (Alam, 1989; Klitgaard, 1988; Quinn, 2008). Since corruption can be difficult to define, Alam (1989) argued that corruption can be best understood as a function of all principal-agent relationships and as such may be defined as “(1) the sacrifice of the principal’s interest for the agent’s, or (2) the violation of norms defining the agent’s behavior” (p. 442). Here, the principals are the people, and the government is the agent. The normal assumptions are that the population would have a united interest in the most public goods at the lowest costs, and corruption would eat away at either the quality or the quantity of the service rendered. Quinn (2008) suggests that when the political elite becomes the agent for the people (principals) through majority state ownership of most capital-intensive industries or the largest export sector, then the principal-agent problem predicts a rise in corruption. This would be especially true within these economic sectors—to the point that the potentially most productive sectors of the economy can become a drain on wealth instead of an engine of growth. The extreme form of betrayal of public interests by the ruling class (agents) could be seen as predatory rule (Levi, 1988).

Some political scientists studying Africa have argued that politicians could be acting “rationally” when they are following “irrational” economic policies. To understand this point of view, one must suspend the assumptions of both no collective action costs and no transaction costs. Since the agents (the politicians) are maximizing their political power (i.e., incumbency and power) and responding to the part of the society that is best organized (e.g., other elites, urban dwellers, the military), they could establish economic policies that provide a return only or primarily to powerful segments while claiming to pursue the public interest. These powerful actors will be parts of society that can overcome their collective action costs. Thus economic policies that enrich a small segment of politically powerful people are enacted, even though they lead to economic performance that undermines the interests of most of the principals (the majority of citizens; see, e.g., Bates, 1981). (Although few such analyses are specifically pitched in principal-agent terms, they can be understood as such.) Again, some have argued that this betrayal of the principals by the agents is greater with majority state ownership of most economic assets (Quinn, 2002, 2008) because the normal economic interests that would lobby government for better policy are no longer separated from government itself.

Weingast (1984) applied this theory to bureaucracies, in which case the agents are the bureaucrats, and the principal is Congress (acting on behalf of the ultimate principals, the voters). Traditional analysis of how tightly Congress monitored bureaucracies found that the monitoring was very loose (Moe, 1984). However, consistent with the literature on principal–agent relations, when costs for monitoring the behavior of agents are high, then agents are held to account through outcomes. Since what members of Congress care about is reelection, if they are regularly reelected, then the bureaucracies are monitored by the desired outcome. Since members of Congress are reelected at very high levels, the need for more monitoring is low—this conclusion is quite consistent with the literature.² Therefore, if benefits from these bureaucracies flow to constituents’ needs sufficiently to allow reelection of the members of Congress, then the bureaucracies are not as autonomous from Congress as the loose monitoring implies.

Levi (1988) uses transaction costs, principal–agent relations, and discount rates to predict the types of tax systems different countries will use. She uses the assumption of revenue maximization on behalf of rulers who use agents (which have different costs to monitor) and the citizenry to show how each predicts different tax schemes. Different systems adopt different revenue collection schemes, and she illustrates how each was a response to different discount rates, transactions costs, and the self-interest of both principals and agents.

Lane (2008) argues that nearly all aspects of politics (i.e., the rise of states, political parties, levels of development) can be usefully seen through a principal–agent paradigm. Lane holds that the only way to fully constrain agents to do the bidding of principals is through the rule of law.

Critiques

Many critique this approach in a similar fashion as they would rational choice. First, some argue that people do not maximize their returns, *per se*; rather, the view of bounded rationality suggests that people “satisfice” instead (March & Simon, 1958; Simon, 1947). The expression “It’s good enough for government work” sums up this sentiment. Therefore, instead of searching for the most efficient contract between the principal and agent, this view holds that the agent does the minimum to satisfy the principal, and the principal does not work for the best contract but only for an acceptable one. However, with the role of information costs introduced into this paradigm, these two approaches are not necessarily at odds empirically, though they would be theoretically. According to the principal–agent paradigm, should the principal learn that the agent is satisficing instead of maximizing, then the principal would likely cancel the contract or seek another agent. However, with high monitoring costs, agents are held to outcomes, and if the outcomes were acceptable, then the relationship would have “worked.”

In addition, one could criticize this approach because it assumes (a) that human behavior is primarily motivated by economic gain or loss and (b) that each party is only pursuing self-interest. Engaging family members as agents could align goals of principal and agent more strongly than could pure economic motivation. Many African dictators and early European monarchs made sure to have family members in charge of the military or other key parts of the bureaucracy.

However, even loyalty for family members could be seen from a self-interested perspective. If a dictator is from a minority ethnic (tribal) group, then he or she often gives disproportionate access to top positions to members from his or her ethnic group or family. This behavior is logical because these agents have self-interest to be loyal to the ruler: They understand that their control over these jobs and resources would likely disappear should a new leader, especially one from a different ethnic group, replace the current one. This arrangement greatly reduces the agents’ returns under alternative arrangements, and their estimated returns under alternative ruling institutions would likely be quite low (see Quinn, 2002, Chapter 9).

Others may hold that the assumptions of principal and agent are too simplistic and that a bureaucracy (especially in the U.S. case) has several competing principals exercising authority over the agent. Those who adhere to the principal–agent paradigm would say that this caveat would not destroy the paradigm but would merely predict more autonomy for agents within the paradigm because principals would be aware that the agents have other principals to whom they are held accountable.

Finally, the formal modeling side of the principal–agent paradigm has been criticized as being too formalistic, with few real-life applications. Real salary schemes seldom match the theoretical models developed. Some have also suggested that the approach is tautological. However, if one uses a paradigm to explain behavior that was previously unexplainable, then the paradigm is useful. The same is true if testable implications of the paradigm emerge. The paradigm is not directly tested, but its ability to predict is (Jensen, 1983).

Possible Application to Recent Events

One can use a principal–agent approach to illustrate part of the recent international financial problem with “toxic” mortgage debts. At the heart of this issue is the fact that many real estate agents and banks sold houses to clients who ultimately could not afford them. Why? Several important elements were in place to shift risk and information. First, investors had limited information about the risk involved in real estate. For quite a while, housing prices seemed to be impervious to price declines. This “limited” or false information shifted incentives in the market as to how safe people felt real estate investments were. Second, financial instruments (called *derivatives* or *credit default swaps*) were created to reduce risk, but those

instruments containing housing mortgages were given quite low risk ratings when they were, in fact, high-risk instruments. Third, these investment tools were effectively forms of insurance and were not regulated by government, which made information costs about them higher. Since these instruments were effectively insurance, but not regulated as such, the banks lent more money against these assets than would have been allowed in regular insurance markets. This led to “overleveraging.” So instead of lending against assets at 3, 5, or even 10 times their value, the loans were leveraged up to 30 times. Therefore, the effect of each bad debt was multiplied 30 times in the system instead of only 3 to 10 times.

Nevertheless, why did the real estate agents and bankers sell houses to people who could not afford them or who could barely afford them? These agents had no incentives to be careful. The real estate agents, being on commission, were paid only when houses were sold. Also, it is important to note, they were not punished financially for putting people into unaffordable houses as long as the sale went through. They had personal incentives that were partially at odds with the principals with whom they did business.

The risk-averse part of the “normal” process of selling mortgages should have been at the level of mortgage banks. In the past, if people bought homes that went into default, the bank lost money. Therefore, it made financial sense for mortgage banks to pay the information cost to scrutinize borrowers’ abilities to repay these loans. However, since bankers knew their mortgages were to be repackaged and sold as mortgage derivatives and securities, the banks were able to move the risk on to others while locking in their profits. Since there was a widespread belief that real estate prices would not fall, others bought these mortgage-backed securities as “safe” investments. Then very high side bets (derivatives) were made on what should have been safe investments but which turned out actually to be risky bets. (Here again, transaction costs and information costs clearly impacted markets in a negative way, although these costs are not considered in microeconomics.) It is important that those engaged in the selling of homes and primary mortgages shared none of the risk and made lots of money shifting the risk downstream, so they sold as many homes as possible. This circumstance illustrates the moral hazard involved in the issue because some profits were divorced from the risks of their practices. Now the people who bought the risky mortgage-backed debts faced adverse selection because these loans were rated as nonrisky investments when they were, in fact, quite risky. Although a full analysis of the recent financial problems is beyond the scope of this chapter, one can see in basic relief some of the key elements of the principal-agent problem. One also sees that the microeconomic assumptions of complete information predicted perfect market behavior (i.e., the market is always right), which proved to be illusory and almost brought down the financial system.

The debate over merit pay for teachers is another current issue that could benefit from a principal-agent explanation. According to Holmstrom and Milgrom (1991), in cases in which the agents perform multiple and complex tasks that are not easily reducible to simple proxy measures, fixed-pay schemes align incentives better than outcome-based pay can. Should outcome-based pay (or merit pay) or promotions be adopted when agents have to achieve several competing goals, and only a few of those goals are directly measurable, then outcome-based rewards would incentivize agents to shift from the hard-to-measure aspects of their jobs to aspects that are easily measured. This is what many critics of “No Child Left Behind” meant when they said teachers would “only teach to the test.”²³ That is to say that the other high-quality items normally taught or required in schools (e.g., discipline, abstract thinking, homework, socialization, effective writing, creative writing, affective learning) were replaced with materials that were to be on the test (e.g., reading comprehension, vocabulary, basic math, geometry). Supporters of teacher merit pay suggest that these incentives would increase teacher effort, especially in poorly performing schools. The idea of raising all salaries to reduce average adverse selection may join these two arguments, especially at the worst performing schools.

In sum, the principal-agent paradigm, which is often used in economics, business, and political science, is a powerful tool, especially when the assumption that people act primarily out of self-interest is most appropriate. Although many argue about whether people maximize returns or look only for acceptable returns, this paradigm can illustrate how by adding the variable of cost of information to models, one can sometimes predict outcomes more accurately. It can also explain how institutions aid or hinder the process of holding agents to account or getting them to do the principal’s bidding when agents’ behavior is otherwise costly to monitor. It is likely a rising paradigm in political science, especially where rational choice (which emphasizes purposeful, self-interested behavior) meets institutionalism (which acknowledges that information asymmetries are real and costly; see, e.g., Hall, 1997).

Notes

1. This review is not meant as a complete review of the all studies on this issue. Rather, it intends to open the door of this literature for undergraduates. Citations emphasize early works, classics, illustrations of a few well known works, and recent reviews, not necessarily a representative sample of the most recent literature and its findings. Most readings that require calculus to understand have been ignored, aside from some general findings.

2. Scandals often result in hearings that appear to be monitoring the bureaucracy for high profile, symbolic issues.

3. In fact, reports of teachers cheating to help students pass the exams are rising. For example, see Axtman (2005).

POLITICAL PSYCHOLOGY

DAVID PATRICK HOUGHTON

University of Central Florida

The term *political psychology* refers to the study of the ways in which human psychology—our thought processes, personalities, beliefs, and so on—affects politics, and it can be thought of as the area where the academic disciplines of political science and psychology overlap or intersect. It can also be thought of as a kind of “bridge” between the two fields. Just as political economy studies the ways in which economic relationships affect political behavior (as well as the ways in which politics affects economics), political psychology looks at the ways in which our cognitions and emotions, as well as the social pressures surrounding us, can shape our behavior in the political realm. It would be odd indeed if the ways in which the human mind works, for instance, did not affect our voting choices in significant ways, the manner in which we campaign, the tendency of some individuals to engage in genocidal behavior, or the practice of terrorism (to note but a few of the ways in which human beings act politically). In fact, while many political scientists attempt to explain our behavior in other ways—most commonly, by modeling it according to the assumptions of classical economics—there is at least a grudging acceptance within the discipline today that any full account of the vast array of behaviors that human beings engage in when they act politically simply *requires* an understanding of political psychology.

The Central Assumptions of the Field

Perhaps rather surprisingly, a number of traditional approaches within political science give psychology short shrift. Many of the theories one encounters when one first studies political science tend to emphasize the importance of structures, context, or what might be called “the nature of the times,” rather than analyzing the properties of actors or individuals. Marxism, for instance, offers an especially stark example of this tendency. It tends to discount the role of individuals in history, ascribing to material factors a powerful causal effect that overwhelms the significance of particular individuals. History, according to this dialectical view, follows a familiar and predictable drumbeat no matter who the actors involved happen to be at any given time. Within international relations theory—to give another example from a wholly different theoretical tradition—the approach called neorealism argues that we can explain a great deal about how and why a state behaves as it does by looking at that nation’s position within the international system. Superpowers, neorealists argue, tend to behave the same way no matter who they are, as do all middle powers and weak powers. If this is so, it follows that we need not trouble ourselves with the analysis of who is leading a particular state or what the leader’s psychological characteristics

happen to be. Nevertheless, political psychology has always had a special appeal for those who believe that political actors—their beliefs, past life experiences, personalities, and so on—*do* make a difference. It attracts those who believe that individual actors matter; that history is not just the story of how structures and contexts shape behavior but of how individuals can themselves shape history and politics. This is perhaps the key assumption that underlies the whole field and brings its adherents together, in spite of the great diversity of approaches within it and the equally great range of topics that political psychologists address.

A second uniting assumption is the devotion of political psychologists to what has been termed *Homo Psychologicus*, as opposed to *Homo Economicus* (Houghton, 2009; Iyengar & McGuire, 1993). Once we decide that individuals *do* make a difference—in other words, that their decisions matter in the sense of having a meaningful impact on historical outcomes—we need to adopt some view of *how* they decide. Two rival models of decision making have come to dominate thinking about political behavior within modern political science, one derived from economics, the other from psychology. These are summarized below.

Homo Economicus

- Humans are comprehensively rational actors.
- Decision makers are assumed to possess perfect information.
- The decision maker generates a list of all available options.
- He or she weighs up the costs and benefits of various options.
- He or she then selects the alternative that delivers the greatest benefits relative to cost (maximizes subjective utility).
- This model is derived from microeconomics or classical economics.

Homo Psychologicus

- Humans are *boundedly rational* actors (defined below).
- Decision makers possess only imperfect information, and there are limits to everyone's cognitive processing capabilities.
- The decision maker employs various cognitive shortcuts when generating a list of available alternatives.
- Not all conceivable alternatives are fully considered.
- The decision maker selects that alternative that "will do" (in other words, the actor *satisfices* instead of maximizing utility).
- Group and broader social pressures may lead decision makers to behave in nonrational ways, even contrary to their beliefs and values.
- This model is derived from social and cognitive psychology.

Although *Homo Economicus* offers a useful set of assumptions for some political scientists—its great

strength is that it simplifies human behavior in a way that makes it predictable, and thus it appeals to those who want to model political behavior in a simplified, parsimonious way—it is not properly considered an approach to political psychology. As its name suggests, many economists and devotees of the rational choice approach to political science use it as a set of simplifying assumptions *in the full knowledge* that these assumptions do not describe how people behave in the real world; they are, however, prepared to sacrifice a measure of accuracy in the expectation that doing so will generate powerful models and predictions. However, even some economists have begun to question the utility of simplifying reality this way (a school of thought often known as *behavioral economics*). What unites devotees of a political psychological approach is precisely this reaction against oversimplification. Political psychology as a field is highly *empirical*: It is concerned with describing and explaining how political agents actually do behave, and not primarily with how they ought to, or with making simplifying assumptions for the sake of parsimony. Of course, taking this approach makes things messy; as soon as the complexity and greater realism of *Homo Psychologicus* are conceded, it becomes clear that much of human behavior is idiosyncratic and unpredictable. This is, however, a price most political psychologists are prepared to pay.

The pioneer in developing the more realistic account of human decision-making behavior called *Homo Psychologicus* here was a brilliant and eclectic academic figure known as Herbert Simon. Simon came up with at least two highly significant concepts with which he will always be associated: *bounded rationality* and *satisficing behavior* (Simon, 1957). Human decision makers are rational, he suggested, but only within the bounds of the information available to them (which is often either limited or too great to process). As a consequence, we often *satisfice* instead of maximize utility. In other words, we frequently just plump for *the first acceptable option that will do* out of a potentially limitless set of choices. So, for example, when you have not already decided where to eat one evening, you usually do not walk up and down the entire length of the street looking each place over and comparing prices and quality in minute detail; instead, you generally pick the first place that is satisfactory. And this, on a slightly different scale, is what policymakers often do, according to the bounded rationality perspective: faced with a potentially limitless range of solutions to a problem, they choose the first available option that is acceptable rather than trying to consider everything. Cognitive psychology has built considerably on Simon's early insights, and we will return to these issues when we consider the impact of that field on political psychology and the study of decision making.

What Political Psychologists Study

There are many different subfields, specialisms, and approaches within the general field of political psychology. Moreover, there are various (rather different) ways in

which an undergraduate or graduate course in political psychology may be taught. One important distinction is that some political psychologists are primarily interested in elite-level behavior. This camp focuses on examining how the perceptions of leaders shape government policies, for instance, or the impact of personality and beliefs on leadership, or on how a particular government decision came to be reached. Other political psychologists are more interested in mass-level behavior, on the other hand, or—put more simply—in how ordinary people behave. A member of this second group might study why people vote the way they do, for instance, or might be interested in the impact of public opinion on government policies or the existence of racism within a given population.

For some academics, the study of political psychology is virtually synonymous with the analysis of U.S. voting behavior, political tolerance, and the impact of the mass media on behavior. Other students of the field look mostly at foreign policy decision making and applications of psychological approaches to international relations. In truth, however, political psychology encompasses all these topics and more. One drawback of this breadth—which essentially derives from the fact that the subject matter of political psychology covers *all* varieties of political behavior—is that experts in one area of the field rarely consider themselves expert in more than one or two of the others. Nevertheless, the field of political psychology today covers topics as diverse as political communication, terrorism, genocide, the mass media, racism, emotion, cognition, neuroscience, group processes, belief systems, personality studies, and political leadership.

How the Field Is Studied

Just as political psychology encompasses an extraordinary array of topics in its subject matter, the field is equally diverse theoretically. Some of its members draw primarily on social psychological theories, for example. This large set of theoretical approaches tends to emphasize the impact of *social* situations on behavior. Other political psychologists are more influenced by cognitive psychology and the older tradition of abnormal psychology, both of which stress the importance of individual characteristics in shaping the way that we behave. Also increasingly prominent within this camp is the increasing number of political psychologists who employ the theories and methods of cognitive and social neuroscience in their work (see the section titled *Where the Field Is Going*).

In terms of the methodologies that political psychologists employ, the field has traditionally been characterized by what social scientists call *methodological pluralism*; in other words, political psychologists have used a variety of methods, both qualitative in nature (including case studies and literature reviews) and quantitative in character (most notably, large-scale survey research combined with the use of statistical procedures). Until recently, there was little evidence that any one method was predominating in the

literature, although this appears to be changing. An increasing proportion of the work published in the field's flagship journal *Political Psychology* in recent years, for instance, has been quantitative in nature, to some extent crowding out the presence of historical case studies and other qualitative work. It is unclear, however, whether this is a real trend within political psychology as a whole or whether it simply reflects an apparent preference, among recent editorial staff on the journal, for quantitative work (Monroe, Chiu, Martin, & Portman, 2009).

Origins and Historical Development of the Field

Political psychology is comparatively new as a recognized academic field. With only a few exceptions, courses in political psychology were not offered at most U.S. and European universities until the 1970s, and it was only at about the same time that the term began to be used by researchers. *A Handbook of Political Psychology*, the first of a subsequent series, appeared in the early 1970s (Knutson, 1973). A professional apparatus began to be created around the subject in the late 1970s, when the International Society for Political Psychology (ISPP) was founded. The organization remains vibrant today, and the ISPP holds its meetings as far afield as Portland, Oregon, and Barcelona, Spain. A new journal—appropriately titled *Political Psychology*—was also set up in 1979, and the field is now recognized as an integral subdiscipline within political science. While the term *political psychology* is less used within the mother discipline of psychology—the majority of adherents of political psychology continue to be employed by departments of political science—the ISPP now also includes within its ranks many professionally trained psychologists, as well as policymakers and the members of policy think tanks and nongovernmental institutions. Measured by the institutional affiliation of authors contributing to the journal *Political Psychology* since 1979, approximately 45% of all political psychologists are professional political scientists, and about 33% work in departments of psychology (Monroe et al., 2009).

The roots of political psychology run much deeper than its recent acceptance as an academic field would suggest, however. In a sense, its subject matter is as old as the study of politics itself, for as long as people have reflected on political questions, they have asked themselves basic psychological questions having to do with why human beings think and act the way they do. One of the first things one discovers in introductory political theory classes—where conventionally we consider the history of political thought as having begun with Socrates, Plato, and Aristotle—is that every political worldview is ultimately based on a view of human nature. In a general sense, every theory of politics is predicated on some general psychological portrait of how human beings are. The 16th-century Italian conservative theorist Niccolò Machiavelli, for instance, developed a famously dark view of human psychology,

which led him to propose in *The Prince* that the end justifies the means and that leaders must be prepared to do anything necessary—including committing acts of murder—to stabilize the state. Classical liberalism, on the other hand—often represented in introductory political theory courses by John Locke and Jean-Jacques Rousseau—is rather optimistic about human nature, leading to a far more benevolent idea of the role government ought to play. In the late 19th and early 20th centuries, these general conceptions of *political man* and arguments about human nature began to gradually coalesce into something more sophisticated, especially as psychology developed into a recognized academic discipline in its own right. In France in the 1800s, for example, conservative thinkers such as Hippolyte Taine and Gustave Le Bon began to develop psychological explanations of human political behavior.

The greatest contributions to the early growth of the field would come from Vienna and Frankfurt, however. Thinkers such as Sigmund Freud and Erich Fromm in particular would have a special impact on the development of the field in the United States, and Freud may in some ways be thought of as *the* founding father of the field because of his early impact on psychology and the imprint of his ideas on early work within political psychology. *Freudianism*—or *psychoanalytic theory*, as it is sometimes called—analyzes the drives or motivations that are assumed to lie within all human beings. Freud argued that sex and aggression are the most significant drives within us, but he also accorded a key role to what he called the *unconscious*—a term he virtually invented but which is now widely used in everyday speech—arguing that many of our true drives and motives are hidden even from ourselves. Because the public display of our basic drives is deemed unacceptable in many societies, their existence is often repressed. They reveal themselves only through slips of the tongue (the now famous *Freudian slips*, another term that has entered the English language) and the analysis of dreams, a medium that Freud regarded as the playground of the unconscious. He also saw the human mind as a continual battleground between our selfish, childish impulses (what he termed the *id*) and our higher, moral selves (the *super ego*). We must listen to both impulses, Freud argued. When we have a difficult time reconciling the impulses of both *id* and *superego*, however, we often subconsciously employ one or more *defense mechanisms*. They include *displacement*, *denial*, *repression*, and *transference*.

The field of political psychology has evolved through a number of fairly distinctive although overlapping historical phases during the past 80 years or so (McGuire, 1993), and we can identify three broad phases in its development: (1) the *era of personality studies* in the 1940s and 1950s, dominated by psychoanalysis; (2) the *era of political attitudes and voting behavior studies* in the 1960s and 1970s, characterized by the popularity of behaviorism and cognitive consistency theory; and (3) an era since the 1980s and

1990s, which has focused on *political beliefs*, *information processing*, and *decision making*, has used *schema theory* and *attribution theory* in particular, and has had a particular (although not exclusive) appeal for scholars of international politics. These categories will be drawn on loosely in the discussions that follow in order to show how political psychology has changed and evolved over time.

Personality Studies and Psychoanalysis

Within the United States, what would become the modern field of political psychology was pioneered during the 1920s by followers of Freud such as Charles Merriam and his student Harold Lasswell at the University of Chicago. The modern study of political psychology is generally agreed to have begun with a focus on personality studies and the appearance of several works of what is usually termed *psychobiography*, an early and still vibrant approach to studying leadership. Psychobiography focuses on the personality characteristics of political leaders and on how these characteristics affect their performance in office. Freud himself authored one or two psychobiographic works, but after his death in 1939, his primary impact on the genre came via the influence of his general theoretical approach.

Freud's emphasis on the role of unconscious motives, childhood development, and compensatory defense mechanisms would have a particular effect on the early work of Lasswell and his own student, Alexander George. It is probably fair to categorize Harold Lasswell as the first modern U.S. political psychologist because it was he who—despite initial indifference toward his ideas within the discipline—did most to probe the relationship between politics and psychology early on. Lasswell's book *Psychopathology and Politics*, published originally in 1930, now stands out as a landmark publication within the field of political psychology, as does *Power and Personality*, a now better-known work of his that first appeared in 1948. Heavily influenced by Freudian psychoanalysis, Lasswell came to argue that what he called the *political personality* results from the displacement of private problems onto public life. Simply put, Lasswell was suggesting that individuals who went into politics were often seeking political power as a compensation mechanism, seeking votes and the attention of an audience (for instance) as a replacement for love that had been lacking at home during their earlier lives.

Alexander George and Juliette George's (1964) *Woodrow Wilson and Colonel House* was similarly influenced by this kind of approach. Although not couching their analysis in especially Freudian terminology, George and George trace much of Woodrow Wilson's adult political behavior to his childhood experiences at the hands of his father, Dr. Joseph Wilson, supposedly a stern Presbyterian minister who rarely showed his son affection or congratulated him on his various achievements in life. As an adult, Wilson was propelled into

a series of conflicts with father figures of various kinds, George and George argue, and he sought the love of the people of the United States as a kind of compensation. The fame and controversy of *Woodrow Wilson and Colonel House* in turn influenced a whole host of works, such as Doris Kearns Goodwin's (1976) *Lyndon Johnson and the American Dream*, Betty Glad's (1979) *Jimmy Carter: In Search of the Great White House*, and James David Barber's (1972/1992) *The Presidential Character*, and the psychobiographic tradition remains a vibrant if (somewhat) diminished one within political psychology today.

The early impact of psychoanalysis on political psychology can also be seen in the popularity of *authoritarian personality theory* during the immediate post–World War II period. Theodor Adorno and his colleagues, who originally developed this theory, believed that right wing authoritarianism—racism and fascism, in essence—were essentially the result of rigid parental discipline within the family (Adorno, Frenkel-Brunswick, Levinson, & Sanford, 1950). Authoritarian persons direct their aggression toward other groups, often racial minorities, in an attempt to compensate for a feeling of personal weakness and insecurity. The compensation mechanisms include a search for absolute answers, excessive conformity, submissiveness to authority, intolerance toward others who are unlike themselves, superstition, stereotyped thought patterns, and an oversimplistic view of reality in general (a tendency, in other words, to see things in black-and-white terms, with no shades of gray permitted). It is easy to see how the authoritarian personality approach might be used to explain the events that led up to the Holocaust, and the theory enjoyed significant popularity until the work of social psychologist Stanley Milgram suggested that we are *all* capable of extreme and unethical behaviors (Milgram, 1974). Adorno and his associates argued that obedience to authority (such as the government) will vary with one's upbringing and that rigid parental discipline had been especially prevalent in countries such as Germany during the 1920s and before.

The Rise of Voting Behavior and Research on Political Attitudes

The influence of Freud on political psychology would wane over time, however. Since it must be admitted that psychology has mostly influenced political science rather than the other way around, trends within political psychology have in general tracked changing fashions within the mother discipline of psychology. During the 1950s and 1960s—and following closely on the heels of similar trends within psychology as a whole—the influence of two other (distinctly non-Freudian) approaches would shape research within the field of political psychology: *behaviorism* and *cognitive consistency theory*. As survey techniques became more sophisticated—making it possible to ascertain the

attitudes and opinions of large numbers of people—attention would also turn from analyzing only political elites to the examination of mass political behavior.

During the postwar period, psychologists such as B. F. Skinner—a devotee of the school of psychology known as behaviorism—began to highlight what they regarded as the fundamentally unscientific nature of Freud's work. Skinner criticized Freud for focusing on untestable propositions (Skinner, 1953). Proper science, Skinner believed, ought to focus on what is testable and measurable, and what is testable and measurable is behavior (in other words, what we can see and quantify). We cannot see or measure people's thoughts, and any attempt to do so—particularly speculation of the sort Freud had engaged in—was bound to lead to bogus science, Skinner argued. At the same time, a behavioral movement within political science began to challenge a reliance on qualitative or heavily descriptive inquiry, arguing that a science of politics could be built only via the patient accumulation of data and the rigorous testing of theories against those data. Heinz Eulau's (1963) book *The Behavioral Persuasion in Politics* was emblematic of this movement, a tradition which remains strong today. Although it is hard to say in retrospect which came first or what precise impact Skinner's ideas had on political psychology—and it must be conceded that there is no “Skinnerian” movement within political psychology comparable to the one animated by Freud—his ideas were at least strikingly similar to those espoused by many students of mass behavior and (more generally) to the behavioral movement within political science. Large-scale survey research and a focus on behavior and on what is quantifiable, rather than the qualitative analysis of particular individuals, became the preferred method of the day for many political psychologists during the 1960s and 1970s, and this remains true today.

At the same time, the older psychoanalytic tradition was challenged on another front, one which—while retaining the Freudian notion of denial, or the rationalizing away of the facts as a central cognitive mechanism humans engage in—dispensed with the idea that Freud's was somehow associated with abnormal development during childhood. According to the theory of *cognitive consistency*, inconsistencies between our beliefs—or between our beliefs and our behavior—cause us to experience an uncomfortable state of tension, at least if we are made aware of our inconsistencies. Social psychologist Leon Festinger (1957) famously referred to this condition as *cognitive dissonance*, a term which has since entered the English language (though it is not always used in precisely the way he intended). Since we generally do not like to be inconsistent, we become motivated to reduce dissonance in some way and bring things back into balance or consonance.

For readers unfamiliar with this approach, the Marian Keech story may prove illuminating and, it is hoped, amusing as well (Festinger, Riecken, & Schachter, 1964). During the 1950s, Festinger infiltrated a religious cult

whose leader, “Marian Keech,” was predicting the end of the world (her name was changed in Festinger’s book to protect her identity). Keech specifically predicted that the world would come to an end on December 21, 1954, but she also prophesied that a flying saucer would pick up the “true believers” on December 20, thus saving them from all the death and devastation that would befall the rest of the world. Many members of the group had invested a lot in Keech’s prediction: They had given up their jobs, given away their savings, and sold their houses in preparation for the coming of the flying saucer. For Festinger, this represented a tantalizing scenario for the testing of his theories. He knew—or at least strongly suspected!—that the flying saucer would never show up, and this in fact proved to be the case.

But what fascinated Festinger was what the group members would do when their theory proved false. What would they do? When the saucer failed to show, Keech had a new (and rather convenient) “vision from God” shortly before 5 a.m. on the 21st, saying that “everyone was saved.” The group members then rationalized away the evidence that they had been wrong all along, and for some, the saucer’s nonappearance even strengthened their belief in the cult! While it would be easy to dismiss the members of the group as simply crazy, Festinger thought that this incident actually illustrates a very common and very human psychological tendency. While *Homo Economicus* suggests that we just update our beliefs when new information becomes available—correcting theories that have been shown to be incorrect—Festinger argued that in reality we usually just ignore or try to explain away dissonant information somehow. We bring things back into balance, in other words, by coming up with some sort of psychologically comforting excuse.

As political psychology turned from an exclusive focus on elites and began to concentrate more on mass behavior, cognitive consistency theory—an approach to psychology that, as we have suggested already, is explicitly suited to the study of attitudes and beliefs—played a central role in the most popular theory of voting behavior developed during the 1960s: the *party identification approach*. This was originally proposed by Angus Campbell and his colleagues (Campbell, Converse, Miller, & Stokes, 1960) at the University of Michigan in their book *The American Voter*. Some studies of voting in the immediate postwar period had suggested that social and economic factors directly determined our voting behavior, so that we can expect a rich man to vote Republican, a poor one to vote Democratic, and so on. But Campbell and his colleagues argued that the picture is more complex than this: A psychological variable, which they called *party identification*, plays an intervening role between “objective” social forces and the way we vote. During our formative years, Campbell and his associates proposed, we develop a long-lasting, stable attachment to a particular political party. Once formed, this loyalty becomes difficult to change and can take the form of an almost religious devotion to “our” party.

How was this approach influenced by cognitive consistency theory? Put simply, it suggested that strong partisans

simply screened out or rationalized away unfavorable information about their own party. These *strong identifiers* were so attached to their party that in some cases they would even end up voting for a party they did not agree with in an ideological sense! During the mid-1960s, for instance, the Democratic Party embraced the cause of civil rights for African Americans, a measure many Southern Democrats opposed at the time. However, substantial numbers of Southern Democrats continued to vote for the Democratic Party for many years after this (and there are probably even today some Southern Democrats who identify with the party despite an opposition to racial integration, although their numbers have certainly dwindled). Equally, many conservative Democrats continued to vote Democrat for many years after the 1930s, when the party embraced what is essentially a liberal economic agenda. Why did this occur? The work of Philip Converse (1964) in particular argued that most voters lacked an internally consistent system of attitudes and beliefs, relying instead on long-term party ties in deciding how to vote. Strong partisans would explain away their party’s poor economic performance, for instance, as the result of something other than their president’s policy choices (they might blame global economic trends, for instance). And they would ignore information about their own party’s standard bearer that did not fit the voting choice they had made.

Decision Making and International Politics

The influence of cognitive consistency theory began to be felt acutely within international relations theory as well during the mid-1970s. Robert Jervis’s (1976) best-known work in international relations, *Perception and Misperception in International Politics*, led the way in this regard, explicitly drawing on the theory of cognitive consistency to make a variety of (then path-breaking) observations about the ways in which the processing of information can fundamentally impact foreign policy decision making and outcomes on the world stage (see also Holsti, 1962). Similarly, approaches drawn from social psychology, such as the groupthink perspective of Irving Janis (1982), also had a significant impact during the same period. Janis showed how the dysfunctional processes he believed to be inherent within certain kinds of highly cohesive groups can lead to decision-making fiascos. Examining well-known episodes from U.S. foreign policy, such as Pearl Harbor, the Bay of Pigs, and the Vietnam War, Janis attributed the faulty decisions in those cases to a phenomenon he called *groupthink*, a tendency to come to a premature and ill-considered consensus within a group before all options and alternatives have been fully considered.

Indeed, during the 1970s and 1980s, cognitive approaches in general—perspectives that emphasize the content of people’s knowledge structures in shaping decision making and behavior in general—began to dominate political

psychology. This trend built on earlier work by Alexander George (1969) on the content of belief systems, a tradition called *operational code analysis*, which remains vibrant today. A whole bundle of cognitive perspectives, including *attribution theory* and *schema theory*, began to influence the field. One thing that all these perspectives share is the assumption that human beings are inherently *limited* in terms of their cognitive capabilities. Unlike, say, computers, human beings have only a limited capacity to process incoming information. We have already seen that the *Homo Economicus* model asks a great deal of human capabilities; to make a fully and comprehensively rational decision, we require *all* the relevant information pertaining to the issue we are facing. But in the real world, we know that actual human beings possess neither perfect information nor the inexhaustible energy needed to consider all alternatives. It may sound like a cliché, but the world is an incredibly complex place, and the average individual is constantly bombarded with information, not all of which can be processed efficiently or effectively.

Imagine that you want to make a fully rational, fully informed decision about where to eat tonight and that you have decided to eat out rather than at home. To meet the standard of pure rationality, you would in principle have to read all the menus of all the cafes and restaurants in your town or city. You would have to taste the various dishes in each dining option that night, comparing taste and quality and price and deciding which represented the optimal choice given your preferences. In that way, you would—as economists put it—*maximize your utility*, selecting the best option relative to its cost. Of course, in the real world, human beings very rarely behave this way. As the neuroscientist Antonio Damasio (1994) has suggested, practically the only individuals who actually make decisions in this laborious, time-consuming way are people who have experienced damage to the prefrontal cortex, an area of the brain located at just about eye level that is closely associated with emotions and decision making. In his book *Descartes' Error*, Damasio relates the story of a brain-damaged patient whom he calls Elliot. When asked to set up a time for his next appointment, Elliot begins an all-encompassing attempt lasting several hours to weigh up the pros and cons of every conceivable date in his diary until his exhausted doctors ask him to stop. As we have seen already in describing the *Homo Psychologicus* approach, what normal decision makers do instead of this is to process information by means of what are generally called cognitive shortcuts or heuristics. These are devices for prematurely cutting short the search for information, tactics that allow us to reach a reasonable decision more quickly and expeditiously than we could if we were to replicate Elliot's approach. Both schema theory and attribution theory focus on the use of such heuristics, and each has had a notable impact on the study of foreign policy decision making.

A couple of examples drawn from the literature will give you a good idea of how such heuristics work in the real

world and how they can affect both the foreign policy decisions made at the highest levels and the decisions of ordinary voters. Schema theory, for instance, argues that human beings are basically *categorizers*: Rather than considering every bit of information that comes to us afresh, we tend to fit people, events, and things into established mental “boxes” in our heads. It just so happened that when U.S. president Harry Truman and Soviet leader Joseph Stalin first met in 1946, Stalin put Truman in mind of his old boss and mentor Thomas Pendergast, a party boss from Truman's early days in Missouri (Larson, 1985). Pendergast had taught the future president the importance of keeping one's word in politics, something that had an important early influence on Truman's mind-set. Because Stalin just happened to look very much like Pendergast, Truman initially reacted warmly toward the Soviet leader and assumed that Stalin would keep his promises, just as Pendergast had. This proved to be a great error, because the Soviet leader would soon break many of the promises he had made in the aftermath of World War II. Historical analogies constitute another type of cognitive schema, and these devices have been especially well studied and analyzed within the field of foreign policy analysis (Khong, 1992).

Something rather similar to what Truman did in the Pendergast case seems to happen when voters make decisions regarding candidates they know little or nothing about. Consider what happens when we are voting for candidates in U.S. presidential primaries, for instance. We often know very little about the candidates who run for our party's presidential nomination; some may be governors of states we know little about, for instance, and even if they are members of the Senate, we may know little about them. When we are choosing between candidates of opposing parties, we can just use our party identification as a shortcut, but how do we make a decision when *all* the candidates come from our preferred party? From the perspective of schema theory, we probably just assess candidates according to how closely they fit our existing conception of the “ideal candidate.” Under such conditions, we base our voting decisions on only a few pieces of observable “data,” and we use this incomplete information to fill in what we do not know by matching a candidate to some stereotype stored in our heads (Miller, Wattenberg, & Malanchuk, 1986; Popkin, 1993). For instance, a candidate who appears “Kennedyesque”—that is, who seems to evoke the image of the late president John F. Kennedy—is likely to do quite well, whereas a candidate who evokes an image of a failed candidate is far less likely to do well at the polls.

Where the Field Is Going: A Fourth Phase?

It may perhaps be too early to talk of a fourth phase in the development of political psychology, but if recent trends are anything to go by, the field may already have entered one. This might loosely be termed the *era of emotion and*

neuroscience. This most recent trend is in large part a reaction against the computer analogy that implicitly underlies much work on cognition and decision making. For the purposes of analyzing behavior, it was often assumed, in the work described in the previous section, that human beings processed information much as a computer does, in a “cold” or neutral way. The brain was treated as little more than a storage system. This was somewhat ironic because it placed supporters of *Homo Psychologicus* and *Homo Economicus* in the same boat, in the sense that both essentially ignored the role of emotion or what some have called *hot cognition*. But human beings do not simply process information; we *feel* things as well. Virtually everything in politics—including political ideas, political issues, and politicians themselves—is loaded with emotion, either positive or negative. Very few people can look at a picture of the World Trade Center falling on September 11, 2001, for example, without feeling something, and this is a factor that obviously differentiates us from computers. Politics often provokes strong emotions in us, feelings such as happiness, sadness, anger, guilt, gratitude, disgust, joy, insecurity, fear, and anxiety.

One interesting insight that has come out of this new body of literature so far is the recognition that emotions are not necessarily irrational. For a long time, emotions have been thought of as something that comes from the heart or the gut rather than the mind. This way of thinking about our reasoning processes has been present in popular culture for hundreds if not thousands of years and probably dates back to the ancient Greeks, and it is still very common in the Western tradition of political thought to contrast ordered reason with passion or emotion. Emotion according to this view is something detrimental to informed, factually based decision making. Yet although we can all think of cases in which emotions have had a damaging impact on decision making—the fears that President Lyndon Johnson seems to have experienced during the Vietnam decision making or the feelings of depression Richard Nixon appears to have suffered during the Watergate scandal might be seen as good examples—there is an increasing recognition within political psychology that emotion is actually essential to good decision making. We have already mentioned the work of Antonio Damasio, for instance, who has shown that patients who lack the ability to feel emotion make consistently bad and even reckless life decisions. In order to reason successfully, we first have to *care* about the outcomes that might potentially result from our actions. The intense fear that we know gripped U.S. decision makers during the Cuban missile crisis, for instance, seems to have had a beneficial impact on decision making, in the sense that President John F. Kennedy eventually chose a set of options for resolving the crisis that de-escalated the conflict rather than the other way around. Within political psychology, the work of George Marcus (2002; Marcus, Neuman, & MacKuen, 2000) on political tolerance and voting behavior and the

research of Jonathan Mercer (2005) within international relations make especially prominent use of this insight about the role of emotion in decision making.

Another thing that has coincided with the recognition that humans are not much like computers is a series of technological advances in the field of neuroscience, the study of the brain. Part of the reason emotion has traditionally been neglected as a factor within decision making is that it is so hard to measure in a scientific way. Indeed, we often cannot be 100% sure what even our closest family members are thinking and feeling. Traditionally, political psychologists have relied on questionnaires and interviews to gauge what people are feeling, but these techniques are unsatisfactory in many cases, not least because people may not state honestly what they think or feel (racially prejudiced individuals may not admit to being racist in questionnaires, for instance). There has been a tendency within political psychology—a hangover, perhaps, from the behavioral era—to neglect what we cannot see or measure. Increasingly, however, we now have the capacity to “see” emotions working within the human brain. Because in recent years neuroscientists have vastly increased our knowledge of what individual parts of the brain do—we know, for instance, that the part of our brains called the *insula* is associated with disgust and the *amygdala* is activated by fear—and because brain imaging techniques such as functional magnetic resonance imaging have been developed, it is possible to directly or indirectly measure the emotions that individuals are experiencing. Political psychologists have begun to work with neuroscientists at an interdisciplinary level to use such techniques in their work. This work is very new indeed, and the results of the few studies done so far are extremely preliminary, but interesting work is already being done in this area (see, e.g., Westen, 2007). Increasing use of brain imaging techniques and an enhanced focus on the role of emotion—as well as the ways that hot processes interact with cold ones—appear to be the future of political psychology, especially in the study of mass behavior.

STRAUSSIANS

SCOT J. ZENTNER

California State University, San Bernardino

Leo Strauss was one of the most prominent and controversial political theorists of the 20th century. He is perhaps most well-known for his view that classical political science, exemplified by Plato and Aristotle, is superior to modern political science in its various forms. Strauss cultivated in his students and admirers a certain disdain for contemporary political science, which he believed was largely irrelevant or even dangerous to political life. He emphasized the need for political science to be prescriptive with respect to the ends as well as the means of political action.

Strauss's followers are now commonly known as the *Straussians*, although some of them resist the label. While there are disagreements among them, they generally adhere to his rejection of mainstream political science, with its emphasis on method, math, and theory. They make up a relatively small but important group within academic political science, several holding posts in some of the most prestigious universities in the United States. While most of them hold formal positions in the field of political philosophy, their work extends to all the substantive fields of contemporary academic political science.

In what follows, the Straussian approach to political science and the place of the Straussians within the discipline are examined. First, the Straussian preference for classical political science is explained. Second, the array of Straussian scholarship is reviewed, particularly with a view to its practical ends. Third, given the political emphasis of the Straussians, the political reaction to their work is

explored. Finally, the political and philosophic divisions among the Straussians are examined.

Classical and Modern Political Science

The Straussian approach to political science may be understood in light of what Strauss viewed as the crisis of liberal democracy. The crisis consists in the loss of confidence in the principles underlying liberal democracy (Strauss, 1964). This loss of confidence was largely caused, Strauss argued, by tendencies manifested in the practical application of those principles, including an excessive preference for rights over duties, a naive and even dangerous belief in progress, and an inclination to moral relativism. Stated differently, liberal democracy had become too liberal and too democratic. Contemporary academic political science, Strauss argued, merely reflects this more general crisis. Strauss and his students believe that classical political philosophy and science may provide a needed corrective to these problems.

The lengthiest Straussian critique of academic political science is *Essays on the Scientific Study of Politics* (Storing, 1962), a collection of articles written by Strauss and several of his students. The essays are sharply critical reviews of several major works in *behavioral political science*, which the authors term the *new political science*. The book provoked a vigorous response within the discipline. John Schaar and Sheldon Wolin (1963) wrote a lengthy,

well-known critique. They were taken aback by what they took to be the “unrelievedly hostile and destructive” temper of the book (p. 126). Even Strauss’s supporters have noted the “bellicose” style of his memorable epilogue to the volume (Behnegar, 2003, p. 143). The book as a whole, and Strauss’s essay in particular, may be taken as the quasi-official declaration of the distinctively Straussian approach to political science.

The Critique of Science

In the epilogue to *Essays*, Strauss criticizes behavioral political science from the classical point of view, which he locates in the thought of Aristotle. First, the new political science drops the Aristotelian distinction between theoretical and practical sciences. The practical success of modern physics and mathematics, which in themselves are theoretical, led to the adoption of those sciences as the models for the practical sciences, including political science. In this way, the sciences as such came to be thought of as distinct from and superior to philosophy. Second, the blurring of the practical and theoretical sciences leads to the distortion of political things, which properly concern matters of action rather than contemplation. The classical view, moreover, held that political action contained principles of its own, irrespective of the claims of theory. The political sphere may require a theoretical defense from the intrusions of visionary or theoretical claims, but politics properly understood is altogether practical in nature (Strauss, 1962).

Third, since politics falls into the realm of practical science, political scientists cannot be mere neutral observers of political action. Political scientists, according to the classical view, must be directly engaged in political affairs. But since political scientists are more learned in the nature of political things, they become “umpires” of political disputes; they are more than mere partisans in those disputes. The new and more theoretical political science, on the other hand, seeks to refrain from such activity as a matter of scientific neutrality. Fourth, because of their political role, classical political scientists necessarily evaluate political phenomena. The new political science, in contrast, precisely insists on not making value judgments. Its scientific neutrality assumes the separation of facts from values; only the former are the proper objects of scientific analysis.

The source of the stridency of the Straussian critique of the new political science may be found in Strauss’s (1962) summary claim that “the political is *sui generis* and cannot be understood as derivative from the sub-political” (p. 311). The new political science deprives human beings of their dignity, according to Strauss, because it does not understand those beings on their own terms. It understands political things as the consequence of subrational or sub-political forces or causes. The political and subpolitical realms are blurred. Classical political science, in contrast, assumes that human beings occupy a distinct place, that is, the political community, within a greater whole. As a

discrete part within the greater whole that is the world, the political community comes to sight as a whole on its own. It is this wholeness of the political community, in turn, that is the ground of the common good. Human beings as citizens in the community share something in common with one another that is different from what those same human beings share with the larger animal and material world. What is shared is their common ends or purposes as political beings, beings concerned with the good, the just, the advantageous, and so on.

The new political science, on the other hand, denies the possibility of human dignity and the common good because it understands the human in the same way that modern science understands the nonhuman; it understands human beings in terms of their origins or causes rather than their ends. According to the new political science, Strauss argues, there is only a difference in degree, and not in kind, between man and beast. The new political science rejects the commonsense or prescientific understanding of the whole made up of political phenomena. This commonsense view, Strauss insists, is the necessary basis of any practical science.

The Problem of Common Sense

Strauss (1962) argues that the obscuring of common sense renders the new political science incapable of either adding anything important to ordinary political understanding or distinguishing the politically relevant from the politically irrelevant. He argues for a genuinely empirical political science against what he considers the spurious empiricism of the new approach. But Schaar and Wolin (1963) quite reasonably point out that, although political science should be addressed to what is practically meaningful rather than what is practically meaningless, it is not always evident that common sense enables us to make that distinction. Indeed, they insist that Strauss does not provide a clear account of common sense as such. Strauss (1962) mentions, for example, the older commonsense view that assumed that witches are real. He argues that the “errors” regarding such things were eventually discovered without the aid of empiricism (p. 317). This means that on the basis of common sense, it came to be understood that people should not be accused of being witches, even though the belief in witches was originally a part of common sense. Schaar and Wolin (1963) suggest that Strauss does not really explain how this was done or what kind of knowledge common sense without belief in witches really is. They question whether, on Straussian terms, one can distinguish the truths from the errors of common sense.

The problem of common sense is central to understanding the Straussian approach to political science. Strauss (1964) remarks that his return to classical political science is “tentative or experimental” (p. 11). This tentativeness is necessary because the conditions of the ancient polity that shaped classical political science are very different from those of today. Strauss engaged in close studies of political

philosophers from the tradition in order to gain some understanding of the movement from those origins to our contemporary circumstances. This return through the reading of old books entails, among other things, awareness of the original commonsense view of witches, ghosts, and the like (Strauss, 1953). Strauss does not, of course, argue that political scientists today actually should believe in witches. However, he clearly suggests that common sense is not always so common. Moreover, what is common in the modern world is an ordinary life decisively shaped by science; it is a world without witches. This naturally raises the question whether Strauss's return to classical political philosophy should ever be more than tentative. Critics of the Straussians suggest that such a return is misguided, given the very different conditions of political science today.

These difficulties are compounded by the problematic character of classical political philosophy even in the conditions of the ancient world. Strauss (1964) notes that Plato and Aristotle understood politics from a philosophic point of view; they did not see the political community as it sees itself. They understood the political world according to the philosophic idea of natural justice rather than the commonsense view of religious authority. Strauss suggests that the historian Thucydides did not make this mistake and so was closer to the original commonsense view of politics than were the philosophers. Strauss appeals to Aristotle's view of common sense, yet he criticizes that view. He seems to admit that classical political philosophy appears to obscure common sense in a manner similar to modern political science.

Nevertheless, Strauss favors a return to classical political science because he believes that the classical approach, whatever its shortcomings, is superior to the modern alternatives. The classical approach is better, not because it is perfect, but because it takes seriously the questions of justice and morality that are central to political life. Modern political science, on the other hand, generally considers moral claims to be relative or subjective value judgments. This is not to say that Strauss thinks that modern political scientists do not take their own political views seriously. Indeed, Strauss contends that political beings properly so called do not consider their political claims to be merely relative or subjective; they consider their claims to be true, or they consider it necessary to present them as true. However, modern political scientists *qua* scientists exclude these political considerations. While classical political science may be unable to provide a complete or comprehensive account of the commonsense meaning of political life, Strauss suggests, modern political science ignores this meaning altogether as a matter of methodological principle.

The Analysis of Regimes

According to the Straussians, value-free modern political science generally fails to perform the central task of genuine political science: the practical study of regimes

(Strauss, 1962). Regimes are the formalized claims to rule based on different opinions regarding justice and morality. These claims are traditionally embodied in the various groups or parties (democrats, oligarchs, etc.) that arise in political communities. But these claims are almost always defective or incomplete in some way. In order to act as umpire within the community, the political scientist must articulate, at least in outline, what a complete regime without defects would be. The philosophers call this the *best regime* (Strauss, 1953). Political scientists presumably are able to articulate the best regime because of their deeper study of politics. Stated differently, Straussians aim to politicize political science as a science. This means more than using what is learned from political science for political ends. It means that political science should aim to discover those ends. In this sense, political science is really only an extension of politics.

However, political scientists do not necessarily attempt to reform the political community in order to make it identical to the best regime. Political scientists are not to act as partisans, convinced of the absolute superiority of their view. The best regime normally provides only a general measure of the health of actual political communities. It is most often useful because it shows why perfection is not possible in actual political life. For example, in Plato's *Republic*, Socrates suggests that the best regime includes a significant communist element requiring the abolition of families and private property. Moreover, this best regime requires the rule of philosopher kings who are not bound by the rule of law. Because of the extreme character of this best regime, Straussians usually interpret it to be a practical impossibility (Strauss, 1953). The political scientist learns from the articulation of the best regime what the practical limits of political life are.

The best regime is the regime that is best everywhere and always. It is not bound to or limited by any transitory conditions. This means that the best regime is the regime that accords with nature or is what is right by nature. The attempt to recover the classical idea of *natural right* is one of the most important features of Straussian political science. However, because the best regime by nature is rarely practical or possible, classical political science articulates a prudent moderation of its aims. As a practical matter, the rule of law and the tutelage of gentlemen is to be preferred to communism and the rule of philosophers (Strauss, 1953). Stated differently, natural right is diluted by or for the sake of political right. The political philosophers may influence politics, but they are to do so in a circumspect and practical manner.

Political philosophers nevertheless always stand in some tension with their political communities because they necessarily question the prevailing regime claims in light of the best regime (Strauss, 1959). The most famous example of this tension was the conflict between Socrates and Athens. Socrates claimed to be helping the Athenians, but they perceived his questioning of their beliefs to be a

threat to what they held most dear. They eventually put him to death for what they perceived to be his crimes. One goal of political scientists, according to the tradition that followed Socrates, is to improve political life without suffering his fate (Strauss, 1959). This requires that the political scientist support the political community while nevertheless criticizing it. For this reason, Straussians generally describe themselves as friendly critics of liberal democracy. While they often use classical sources in order to criticize modern politics, they defend this criticism as helpful to modern politics.

The Straussian emphasis on the practical character of political science resembles in certain respects two broad movements in academic political science that gained prominence in the discipline after Strauss's death: *postbehavioralism* and *rational choice*. Both of these approaches stress the idea that political science should prescribe political action, not merely describe and explain it. However, James Ceaser (1992) has expressed most fully the Straussian view that these approaches share behavioralism's main flaw, namely, indifference to the regime question. While these approaches may provide interesting or useful information about how to achieve the ends of political life, they do not seek to identify those ends in light of the best regime. Straussians believe political science proceeds directly from the commonsense arguments inherent in political life regarding the right and just ordering of society. The techniques of modern political science can be, at best, only instrumental to the precisely political role of political science.

Straussian Studies

Many of Strauss's students and admirers have followed his example of studying the great books of the philosophic tradition. Such studies are often viewed as propaedeutic, a necessary part of understanding the basic questions of political life. Straussians are known in particular for their very close readings of classic texts. This includes what some critics consider the controversial attempt to understand the great philosophers as they understood themselves, without modern presuppositions affecting the interpretation of the classics. In keeping with this approach, the Straussians have produced quite literal translations of many classic texts. Such translations are considered a part of both effective teaching and sound scholarship. The need to return to the classic tradition has even led some Straussians, most notably Seth Benardete (1989, 2000), to concentrate their work almost entirely on the study of ancient Greek philosophy and poetry.

Most Straussians, however, do not limit their scholarly work to the study of classical texts. They have produced work in all the substantive fields within academic political science. Despite the variety of their work, they may be said to share Strauss's view that political science should proceed

from the ordinary questions of political life and have as its aim the improvement of the political community. This political disposition is evident in the variety of Straussian studies. Thomas Pangle (2006) and John Murley (2005) have provided extensive reviews of these works. It is helpful here to highlight briefly several characteristic examples of Straussian scholarship.

Allan Bloom is perhaps the most well-known of Strauss's students. He earned popular acclaim with his best-selling *The Closing of the American Mind* (1987). The book is largely an indictment of higher education and popular culture in the United States from the Straussian point of view, particularly the idea that the classical emphasis on moral and intellectual virtue has been vitiated in the name of the modern turn to egalitarian and democratic principles. The book was especially popular for its often amusing take on the manner in which these modern tendencies manifest themselves in the social lives of college students. In this respect, the reaction to the book provides some insight into the popularity of Straussian ideas among many college students exposed to them. More broadly, the attention paid to Bloom's book reflects the attractiveness of the Straussian critique of modernity. There are a number of postmodern criticisms of modern life, but with their appeal to the philosophic tradition and common sense, Straussians offer a distinct alternative, however controversial, within the academy.

Consistent with Strauss's emphasis on common sense and traditional thought, Straussians place great importance on the study of the origins of political communities. Given that most Straussians live in the United States, this naturally has resulted in an interest in the American regime. Martin Diamond (1992) and Herbert Storing (1995), for example, emphasized the role that political ideas and statesmanship played in the founding of the United States. This approach rejects theories that find in economic or psychological forces the chief causes of the founders' actions. Straussians examine the regime claims of the various partisans of the time, and the arguments made in support of those claims, with a view to an articulation of the genuine meaning of the Constitution and other major documents of the founding.

The Constitution's influence has been a particularly important part of the Straussian study of the United States. Harvey Mansfield (1991), for example, has suggested that the forms of the Constitution serve as the principal brake on the democratic tendencies of the regime. Those tendencies are derived from the revolutionary and egalitarian origins of the United States. The maintenance of constitutional forms is, Mansfield argues, crucial to the success of the regime. In this respect, like many Straussians, he follows Alexis de Tocqueville in his study of the customs and mores that sustain or harm regimes.

Indeed, according to many Straussians, Tocqueville's work is the model for classical political science in the modern world (Ceaser, 1992). In keeping with the idea that

one should be a friendly critic of liberal democracy, Tocqueville criticized the United States and France with the intention of improving liberal democracy as the best practical form of government under modern conditions. In similar fashion, while many Straussians are critical of the underlying principles of the United States as unduly modern, they often stress what they take to be the more salutary elements of the regime, such as the adherence to constitutional forms.

Straussians generally emphasize the need for moderation in liberal democracy, particularly in light of the rise of progressive ideas in the past century. They look to the classical descriptions of the gentleman and the statesman as models for politicians today. Strauss suggested that the classical philosophic notion of aristocracy, however inapplicable to modern conditions, remained in principle the generally superior regime type. In keeping with this idea, Straussians generally argue that the aristocratic elements of liberal democracies should be encouraged if those democracies are not to suffer the traditional failings of popular governments. Supporting the aristocratic elements requires, in addition to the defense of constitutional forms, support for the cultivation of principled statesmanship. Respect for forms and the teaching of statesmanship are related aspects of regime analysis, for the holders of duly constituted public offices are the practical embodiment of the regime.

Accordingly, with respect to the courts, Straussians such as Walter Berns (1987) tend to share with other conservative scholars a respect for constitutional forms and, in particular, a preference for judicial restraint. They generally oppose the idea that the meaning of the Constitution evolves or changes over time. This opposition follows from the Straussian concern to maintain the forms of the Constitution as the moderating force in the democracy. When deciding cases, judges should look more often than they do to the wisdom of the framers of the Constitution and the great jurists of the founding era.

Straussians have examined the American presidency in a similar fashion. Jeffrey Tulis (1987), for example, has criticized the rise of the modern progressive presidency, with its emphasis on popular rhetoric and dependence on democratic opinion. James Ceaser (1979) has examined the extent to which changes in electoral arrangements have contributed to this development. These studies argue that under current circumstances, the presidency is much less able to fulfill the moderating and quasi-aristocratic role in the regime intended for it by the founders. Classical regime analysis in this case reveals the particular problem of democratic decay in the conditions of the modern state.

Other Straussians, especially Diamond and Storing, as well as their students, have taken an alternate view, but with the same intention, by locating potentially moderating institutions and practices within contemporary U.S. government. In general, they are less critical of liberal democracy in general than are most other Straussians. For

example, Joseph Bessette (1994) has argued that the modern Congress, despite its shortcomings, in many ways fulfills the founders' original hope for a deliberative legislative process. John Rohr (1986) has considered the possibility that the modern civil service, despite its significant role in the modern state, might, with the proper guidance, play a moderating or even statesmanlike role in the mature American regime.

The most significant Straussian scholar of American politics is Harry Jaffa. Among Straussian works, his writings on Abraham Lincoln, slavery, and the Civil War provide the most searching account of the relationship between political philosophy and statesmanship. In his early writings, Jaffa (1959) argued that Lincoln corrected the regime of the founding fathers, which unduly relied on the modern idea that the preservation of private rights is more important than moral obligation. In his later writings, Jaffa (2000) has presented a more subtle and complex interpretation, arguing that Lincoln did not correct the founders' modern principles but actually recovered the classical core of their thought. Jaffa insists on the need to understand the thought of the founders and Lincoln on its own terms and not simply as a by-product of the general currents of modern thought.

Straussians highlight the degree to which the ideas and principles of rulers, as opposed to economic or psychological causes, shape the course of events. As exemplified in Jaffa's work, Straussians often focus their studies on the writings and speeches, the reasoned arguments, of political leaders. This follows from the idea that political things must be taken on their own terms if we are to see them fully for what they are. Straussians have taken this approach to other areas as well, including political psychology and political economy. These studies aim to show that the phenomena in question are decisively political in character and not reducible to other causes. This is especially evident in Straussian studies of the problem of tyranny. Scholars such as Charles Fairbanks (1993) and Myron Rush (1974), for example, have followed Strauss's (1991) example by showing that modern communist and fascist tyrants are best understood in terms of their ideological self-understanding.

Also noteworthy are Straussian works in the area of international relations. In keeping with the return to classical sources, Clifford Orwin (1994) and others have engaged in close and detailed studies of Thucydides and other great books in the tradition. They have followed Strauss's lead in reading Thucydides' account of justice between nations as a companion to the works of the great philosophers. These new interpretations diverge from more traditional "realist" accounts of the Greek historian. Added to this work have been further Straussian studies of Machiavelli, Kant, and other sources of modern realism, neorealism, and idealism. These philosophical and historical readings have led Straussians to question a number of the assumptions of these more contemporary theories.

Not surprisingly, Straussians emphasize the important relationship between political regimes and the conduct of international affairs. Classical political philosophers wrote more extensively on domestic matters than on foreign affairs. From the classical perspective, policy concerns regarding war and diplomacy cannot be understood apart from regime analysis. The most famous classical example of this is Socrates' depiction of the guardian class in Plato's *Republic*. In this light, Straussians have explored the relationship between foreign affairs and the character of modern liberal democracies. Jeremy Rabkin (2005), for example, has argued that sovereignty is an essential element of constitutional democracies. Only sovereign governments can make and enforce laws needed for the protection of individual rights and the maintenance of democratic norms. Straussians generally are wary of the contemporary trend toward multilateral agreements and the like, which they believe can pose serious threats to sovereignty and constitutional government.

Politics and Political Science

Any discussion of the Straussians must address the political controversies surrounding their work. Straussians have come under criticism, some of it quite severe, for appearing to suggest that they have special knowledge of the best regime. This criticism is intensified by the political conservatism of most Straussians. A number of Straussians are or have been active in conservative media outlets and public policy institutes, as well as in the Republican Party. While not all Straussians are politically conservative, relatively few of them are liberal.

The political criticism of the Straussians became most acute during the administration of President George W. Bush, which employed a number of foreign policy assistants with varying connections to Strauss or the Straussians. The Straussians were criticized, in particular, for their association with neoconservatives, who generally have favored an interventionist and unilateral foreign policy. The harshest critics accuse the Straussians of being a cabal that deceives the public in order to justify war and undermine democracy. This charge of deception was made most often with respect to the Bush administration's claims regarding weapons of mass destruction in Saddam Hussein's Iraq.

While many of these critics may be dismissed as narrowly partisan, the controversy did highlight an important element of the Straussian approach to political science. Several academic critics of Strauss, most notably Shadia Drury (2005), have argued that Strauss believed philosophers like himself were fundamentally superior to ordinary human beings. Strauss's best regime of natural right, Drury suggests, really amounts to only a defense of the rule of the strong over the weak. The Straussians, she claims, believe they are a kind of philosophic aristocracy. They believe the

ignorant many exist only to serve the philosophic few. In this reading, Strauss follows Machiavelli and Nietzsche by glorifying fraud and power.

The principal source for Drury's charge is Strauss's well-known view that political philosophers often write in a manner that both reveals and conceals what they really think (Strauss, 1952). The philosophers do this as a matter of prudence. On one hand, the philosopher may be persecuted, as in the case of Socrates, because the people perceive the philosopher's questioning to be a threat to the community. On the other hand, the philosopher's questioning may very well undermine the necessary beliefs of the community. In this sense, Athens may actually have been justified in condemning Socrates. The solution to this problem is represented most famously by Plato, who communicates poetically through the characters in his dialogues and not directly in his own name. Only the philosophic few presumably can decipher the secret meaning of Plato's texts. In this way, the philosopher writes exoterically for the many and esoterically for the few.

Most Straussians defend the general notion of esoteric speech and writing as a part of political life itself. It is commonly understood that statesmen often refrain from fully stating their opinions. For example, as Jaffa (1959) has argued, Abraham Lincoln's rhetorical efforts to navigate between the competing forces of slavery and abolition were akin to exoteric writing. Even though he favored abolition, Lincoln could not state explicitly his real aim to end slavery in the South. Similarly, given the racist opinions of his time, he could not openly support social and political equality for African Americans. Lincoln's calculated rhetoric, Jaffa argues, was intended to serve practically the ends of equality and freedom rightly understood. Straussians similarly defend their political science as a form of prudence.

Political scientists of almost every stripe, including Drury, admit that some degree of elitism, if only for the sake of competence, is necessary and even desirable in liberal democratic politics. The larger question concerns the appropriate degree and form of elitism. At various places in his writings, Strauss refers to a fundamental conflict between philosophy and politics. Because of their greater knowledge, philosophers tend to form a class separate from the rest of the community. Because of this, politics and philosophy cannot be completely reconciled. Moreover, the separation of politics and philosophy in some sense is necessary for the proper understanding of both.

The Straussian critique of modern political philosophy centers on the modern attempt to overcome the separation between politics and philosophy. Classical political philosophy proceeded from the view that the many could never become truly philosophic. Modern philosophy, on the other hand, attempted to make the many philosophic, in a sense. It did this by means of enlightenment. But in order to enlighten, modern philosophers had to simplify political life. Human things had to be portrayed in nonhuman terms.

This is, as mentioned above, the root of the Straussian critique of contemporary political science. Strauss argued that the simplification of human things brought about a distortion of political philosophy. A characteristic trait of genuine political philosophy is awareness of the immense complexity of human things. Political philosophy lacks a complete account of all things and so cannot rule political life in a comprehensive way. Stated in Straussian terms, natural right cannot completely replace political right. Strauss argues that modern philosophy's simplification of human things through enlightenment is, in effect, an attempt at such replacement. It is the real effort to subordinate politics to philosophy.

A number of Straussians have defended Strauss from the charges by Drury and others. Catherine and Michael Zuckert (2006) have presented the lengthiest such defense. The novelty of their argument is the claim that Strauss did not, in fact, write esoterically. In particular, they claim that Strauss did not have a secret teaching. Strauss is known for often writing in a cryptic and enigmatic manner. This has naturally led many observers to think, in light of his explicit descriptions of esoteric methods, that Strauss also wrote esoterically. The Zuckerts, however, argue that Strauss's writing style indicates his "pedagogical reserve," not his esotericism (p. 136). Modern liberal democracy, with its relative degree of openness, has largely eliminated the need for esoteric writing. But while esoteric writing is no longer necessary, the need for restraint in philosophic education of students remains. Complete openness at the outset of such education might undermine students' emerging appreciation of the peculiar pleasures of philosophy. Strauss's manner of writing, the Zuckerts suggest, does not serve a political purpose.

Many observers, including many or most Straussians, remain unconvinced by the Zuckerts. Given the fact that any esoteric teaching would necessarily be difficult to discern, it is difficult to conclude that Strauss did not have one. In any case, it is not clear that such a teaching, even if it existed, must be hostile to liberal democracy. While it is fair to say that much of their work is critical of democracy in its contemporary form, it is also reasonable to conclude that the Straussians do not intend to overthrow democracy.

Straussians, East and West

The Straussians at times appear to disagree among themselves as much as they do with the wider academic and political communities. The differences among them illustrate several key aspects of the Straussian approach, particularly their understanding of the relationship between liberal democracy and political science. The Zuckerts have noted at least three distinct types of Straussians, typically identified according to the geographical locations of their principal representatives. The "East Coast" Straussians, who appear to be the greatest in number, are the most critical of liberal

democracy, which they see as too modern in its origins and principles. Prominent East Coast Straussians include Bloom, Berns, and Pangle. Jaffa and his admirers are the "West Coast" Straussians, who vigorously defend the regime of the American Founding and deny that its principles are fundamentally modern. A third group, which the Zuckerts call the "Midwest" Straussians, believes that the American Founding is fully modern but that modern principles are not as bad as other Straussians tend to think. Diamond and Storing are the most notable members of this group. Insofar as they are the least critical of modern political philosophy, the Zuckerts note, they are the least Straussian of the three groups.

The sharpest exchanges between the Straussians have been initiated by Jaffa (Zentner, 2003). He has criticized Diamond, Berns, Pangle, and Bloom, as well as prominent conservative admirers of Strauss such as Irving Kristol and Wilmoore Kendall. He insists that both sound public policy and genuine political philosophy require adherence to the principles of the Declaration of Independence. Most Straussians, he argues, wrongly apply to the American Founders Strauss's critique of early modern philosophers such as John Locke. Strauss criticized Locke for favoring rights over duties and self-preservation over virtue. Jaffa suggests that while Strauss's account of Locke is perhaps at the deepest level true, it does not apply to the founders since they did not read Locke in the manner that Strauss did. Their thought, Jaffa insists, must be understood on its own terms.

Jaffa's Straussian opponents argue that he wrongly characterizes their critique of the American Founders as more extreme than it really is. They follow, in their view, Strauss's example of the loyal critic of liberal democracy. Moreover, they suggest that Jaffa's approach lacks the skepticism required of the political philosopher. Berns, for example, suggests that Jaffa assumes political philosophy should be edifying. According to Berns, Strauss specifically denied this role to philosophy. Pangle has similarly characterized Jaffa as much too strident. The political role of the philosopher, he argues, should be more circumspect. Political philosophers necessarily follow Socrates' example and question the orthodox opinions of their fellow citizens. Political philosophers in the U.S., then, must call into question, however gently, the founders' egalitarian and democratic principles.

The quarrel among the Straussians derives, in part, from their opposed interpretations of the core of Strauss's thought. Strauss (1997) considered the "theological-political problem" the theme of his life's work (p. 453). This problem, briefly stated, concerns the tension between particularistic identities, on one hand, and universalistic commitments, on the other. Strauss observed that this was a perennial human problem. Every human being, in both ancient and modern times, is at once a natural being and a citizen, a universal being and a political being. The tension between these two aspects of life became acute with the rise of biblical religion and its universal moral beliefs.

Before biblical religion, there rarely was an explicit division between political and religious authority. All authorities in the ancient city were political or particularistic. The ancient city was what we today call a closed society. In that world, the awareness of the human or the universal in a meaningful sense became evident, if at all, only when philosophers appeared and began to articulate the universal idea of nature. Biblical religion, especially Christianity, was unlike the other ancient religions because it exhibited a universalism similar to philosophy. In this way, the relationship between politics and religion became confused or incoherent. Religion no longer provided the authority for politics in an unproblematic way.

Indeed, the West became the arena for the working out of the two universalistic claimants to temporal and political authority: Greek philosophy and biblical religion. Strauss (1997) suggested that this tension between reason and revelation was the vitality of the Western world. The tension largely emerged out of the philosophic attempt to provide or restore theological-political coherence to human life. Sometimes, as in the case of medieval natural law doctrines, this philosophic attempt actually appeared in the guise of religion. Strauss was somewhat more sympathetic, however, with modern philosophers, such as Spinoza, who attempted to provide through liberal democracy something like a commonsense ground for political life apart from religion.

Liberal democracy was intended to solve the theological-political problem by separating the state from society and the church from the state. Religious beliefs as well as different forms of prejudice, racial and otherwise, would be left to the private realm. The public realm would be dedicated to the shared concern for the protection of individual rights and a limited public good. But Strauss (1997) emphasized two basic problems with this solution. First, prejudice could fester and become more dangerous precisely because it was left alone in the private realm. Second, the separation of church and state leaves the state without the support of the highest and most binding authorities: God and divine law. The result would likely be an anemic state that could not hold sway over a society moved by prejudices of one sort or another. Strauss interpreted the collapse of the Weimar Republic in Germany and the rise of the Nazis in just this way. In related fashion, he likened the predicament of African Americans in the United States to that of the Jews in Germany.

The disagreements among the Straussians regarding liberal democracy and the American Founding reflect Strauss's ambivalence about both. The East Coast Straussians appear to have adopted the more sober aspect of Strauss's view. Although they support liberal democracy in general, and the U.S. constitutional system in particular, they tend to emphasize the need to correct what they take to be their defects. This approach is in line with the more general Straussian antipathy toward modernity. The Midwest Straussians, it should be noted, do not differ

substantially from the East Coast Straussians with respect to their general interpretation of liberal democracy and the American Founding. However, they evaluate both more positively. The emphasis on private rights and self-preservation has, they suggest, resulted in a more or less decent system of government broadly consistent with the human good. Liberal democracy appears to be particularly favorable in comparison with other available forms of government in the modern world.

The West Coast Straussian view represents the clearer innovation on Strauss's theme. Jaffa's interpretation of the American Founders and Lincoln seems tailored to address the particular problem of liberal democracy that Strauss describes. That problem rests on the hollowness of liberal democracy itself, particularly the public indifference to private opinion. Jaffa's interpretation of Lincoln and slavery suggests that liberal democracy need not be understood in narrowly Lockean or self-interested terms. He defends Lincoln's argument that the Founders' principles provide clear moral guidance on the question of slavery. The protections for slavery in the South were compromises necessary to secure the Union. But as compromises, they reflect the underlying moral principle of natural human equality. Jaffa suggests that the founders' principles reflect in important ways traditional elements of natural right that ultimately find their roots in the thought of Plato and Aristotle.

Many East Coast and Midwest Straussians believe that Jaffa has mixed classical and modern principles in untenable ways. For example, they often point out that classical natural right, which emphasizes duties over rights, is essentially inconsistent with modern natural right, which emphasizes rights over duties. Jaffa's response is that the emphasis on natural rights as an answer to the theological-political problem, that is, the basis for the separation of church and state, should be understood primarily in practical and not theoretical terms. In other words, he argues that he returns to the commonsense understanding of political life that Strauss urged on political scientists. The difficulty, as Jaffa admits, is that the commonsense understanding of practical life today is greatly influenced by theoretical considerations. This is nowhere more evident than in the fact that the idea of natural rights, on which the founders base their politics, is a product of theory and philosophy. The East Coast and Midwest Straussians emphasize this important point.

Conclusion

The Straussians are likely to continue to quarrel among themselves, not only about the principles and practices of liberal democracy, but about the meaning of Strauss's work as well. They also likely will continue to provide provocative accounts of contemporary politics and public policy, which will in turn draw further criticism. Their peculiar form of traditional political science represents a distinct, if

at times controversial, voice in the world of academic political science. However, in this the Straussians are not unusual. Their contentious views may best be seen as part of the ongoing discussions, well-known within political science, about the very meaning and purpose of the discipline.

PART II

COMPARATIVE POLITICS

SYSTEMS THEORY AND STRUCTURAL FUNCTIONALISM

JOHN R. FISHER

Northwest Missouri State University

Although structural functionalism finds its roots much earlier than systems does theory, as researchers use it today, it is based on systems theory. Structural functionalism traces its beginnings back to the ancient Greeks and the writings of Aristotle (Susser, 1992). Systems theory emerged much later. Although the discussion of systems began with biologists in the 19th century, systems theory was not fully articulated until the 1920s. Ludwig von Bertalanffy (1956, 1962), who developed *general systems theory*, was a principal in establishing it as a field of study. Although systems theory originated later than functionalism, when researchers study functions within their structures, they do it within the scope of systems. The study of political systems came into its own with the adoption of a structural-functional approach.

The systems approach of David Easton (1965a, 1965b) and Karl W. Deutsch (1963) grew out of sociological and communication theory and a “move toward the theory and data of politics” (Almond & Powell, 1966, p. 12). Easton and Deutsch followed a communication, or cybernetic, model to study politics. Gabriel A. Almond’s study of political systems grew out of a tradition of political theory and draws from sociological and communications theories. While Easton and Deutsch adopted a purely systems approach, Almond applied structural functionalism to

systems theory. Both have value in the study of political systems.

Systems Theory

A system, according to Anatol Rapoport (1966, 1968), is a set of interrelated entities connected by behavior and history. Specifically, he stated that a system must satisfy the following criteria:

1. One can specify a set of identifiable elements.
2. Among at least some of the elements, one can specify identifiable relations.
3. Certain relations imply others.
4. A certain complex of relations at a given time implies a certain complex (or one of several possible complexes) at a later time. (Rapoport, 1966, pp. 129–130)

This definition is broad enough to include systems as different as the solar system and language. Social systems, including economics and politics, fit within the definition. Social systems might be described as a class of entities (individuals, families, institutions) with relations among them (communication channels, influence, obligations). Systems are classified by the “nature of their relation to their environments” and the “search for laws governing the

behavior of each class" (Rapoport, 1968, p. 453). Systems appear to have "a will" of their own and a "purpose" to maintain a steady state. Living systems do this through homeostasis mechanisms that restore equilibrium. Social systems have similar mechanisms (Rapoport, 1968).

While systems in the physical sciences (like the solar system, chemical reactions, and ecological systems) are extremely rigorous, social systems are less precise. In social systems, the elements and relations are vague and hard to define. As the basic unit of social systems, roles are commonly difficult to identify and classify. For the "hard" sciences, this ambiguity would be regarded as problematic, but with the social sciences, it would be commonplace (Rapoport, 1966).

The Political System

A long-standing problem of political science has been to describe and account for the internal structure of the political system. According to William Mitchell (1968), *structure* is generally applied to patterns of power and authority that characterize the relationships between the rulers and the ruled. These relationships are enduring and thus predictable.

In systems theory, the unit of analysis for these power relations is *role*, a concept developed in social psychology and applied to sociology. Political roles deal with decision making on behalf of society and with performing actions that implement the decisions and allocate scarce resources. In analyzing the political system, the researcher typically describes these roles and the people performing them. Traditionally, the main approach to classification has been "the distribution of power" (Mitchell, 1968, p. 474) among the members of the system. Because the one dimension of roles has inadequately described political systems, systems analysts have developed more inclusive variables that lend themselves better to measurement (Mitchell, 1968). Talcott Parsons (1951) put forth a set of variables that he called *pattern variables*. Gabriel Almond (1956; Almond & Coleman, 1960) suggested classifying structures based on (a) the degree of differentiation between structures, (b) the extent to which the system is "manifest" or "visible," (c) the stability of the functions of the various roles, and (d) the distribution of power. Mitchell (1968) added a fifth dimension, concerning the "sustainability of roles."

A system is generally thought of as being self-contained and distinct from its environment, with observable boundaries. In the process of determining formal members (or citizens) and their actions, boundaries are arbitrarily assigned to the political system. However, most systems are subject to external influences. Thus, analysis must also be concerned with "detecting relationships across boundaries" as inputs and outputs (Mitchell, 1968, p. 475). Yet no common language exists to describe these boundary exchanges of inputs and outputs. Easton (1957, 1965a) saw inputs as consisting of *demands* and *support* while Almond and James Coleman (1960) used the terms *political socialization*, *recruitment*,

interest articulation, *interest aggregation*, and *political communication*. Easton called the outputs *decisions*, and Almond and Coleman describe outputs as *rule making*, *rule application*, and *rule adjudication*. Mitchell (1962) used the terms *expectations and demands*, *resources*, and *support* for inputs and *social goals*, *values and costs*, and *controls* to express political outputs.

While boundary exchanges play an important part in the analysis of political systems, the main concern is with the internal processes of a system. An early area of inquiry dealt with the question of how politics would allocate scarce resources (Easton, 1953; Mitchell, 1968). Other areas of process investigation concerned the stability of systems, political socialization, and other support inputs. A third area of examination surrounded the means of ensuring loyalty and stimulating public participation. A fourth area looked at the means of achieving collective goals "from diverse individual demands" (Mitchell, 1968, p. 475). Finally, the process of dealing with problems within the political system became a matter of inspection. Mitchell (1962) viewed the internal processes of the polity as parallel to those of the larger social system. He suggested focusing on goal attainment, adaptation, system maintenance and tension management, and integration.

Applying Systems Analysis

Easton (1966) proposed to define political systems more broadly than did Rapoport. Easton defined a system as "any set of variables regardless of the degree, of inter-relationship among them" (p. 147). He preferred this definition because it freed the researcher from the need to prove that a political system is really a system. The only question of importance became whether the system was interesting and thus worth studying. The analysis need only provide understanding and an explanation of the human behavior that was of concern to the researcher.

Easton (1953, 1966) suggested that a political system was distinct from other systems because it concerned itself with "the interactions through which values are authoritatively allocated for a society" (1966, p. 147). He divided the political environment into two parts: the *intrasocietal* and the *extrasocietal*. The first comprises those systems in the same society as the political system that are not political systems because they do not have political interactions. Intrasocietal systems form the segments of society of which the political system is a component, including the economy, culture, social structure, and personalities. These systems create and shape the conditions in which the political system operates. A changing economy, culture, or social structure all have impact on political life.

The extrasocietal environment includes all the systems that are outside the given society. They may form a *suprasystem* of which the political system may be a part. An example of an extrasocietal system is the international cultural system.

From the intra- and extrasocietal systems come influences that may cause possible stress on the political system. Internal or external disturbances to the intra- and extrasocietal systems may cause stress on the political system and thus change it. However, it is also possible that some disturbances may aid in the persistence of the system while others may be neutral with regard to stress. If political systems are to continue, they must fulfill two functions. They must be able to allocate values to society and get most members of society to accept the values. The allocation of values for a society and compliance with them are essential variables of political life and distinguish political systems from other systems. By identifying these essential variables, researchers can determine when and how disturbances can cause stress to the system.

Easton (1966) provides examples of defeat at the hands of an enemy or of a severe economic crisis causing widespread disorganization and disaffection. When authorities are unable to make decisions or decisions are no longer accepted by societal members, system allocations of values are no longer possible, and the society collapses. More likely, the disruption of a political system is not that complete, and the system continues in some form. As long as the system can keep these essential variables operating, the system will persist. The capacity to counter stress is crucial to the survival of the system. The system's history of response to stress allows analysts to determine whether it is able to survive disturbances. Easton (1966) claimed that systems analysis is especially suited "for interpreting the behavior of the members in a system in the light of the consequences this behavior has for alleviating or aggravating stress upon the essential variables" (p. 149).

According to Easton (1966), systems analysis provides a way of determining the impact of the many diverse environmental influences on a system. In this way, it is possible to reduce the blow of stresses on the system and recommend appropriate action. Through the use of the concepts of inputs and outputs, the enormous variety of influences can be reduced into a manageable number of indicators. The distinction between a political system and other systems allows for interpretation of behaviors in the environment as exchanges or transactions that cross the boundaries of the political system. Easton used the term *exchanges* to refer to "the mutuality of the relationships between the political system and the other systems in the environment" (p. 150). The term *transactions* was used "to emphasize the movement of an effect in one direction, from an environmental system to the political system, or the reverse, without being concerned at the time about the reactive behavior of the other system" (p. 150).

Inputs and Outputs

Because systems are coupled together, all behavior in society is interdependent. To trace the complex exchanges and reduce them to manageable proportions, Easton condensed the main environmental influences into a few

indicators. He designated the effects that are transmitted across the boundary of a system toward some other system as the *outputs* of the first system and the *inputs* of the second system. A transaction or an exchange between systems can be viewed as a linkage between them in the form of an input-output relationship.

Inputs serve as a powerful analytic tool because they summarize variables that "concentrate and mirror everything in the environment that is relevant to political stress" (Easton, 1966, p. 150). The extent to which inputs can be used as summary variables depends on how they are defined. In their broadest sense, they include "any event external to the system that alters, modifies, or affects the system in any way" (p. 150). However, by focusing on boundary-crossing inputs dealing with the most important effects contributing to stress, one can simplify the task of analyzing the impact of the environment. Analysts no longer need "to deal with and trace out separately the consequences of each type of environmental event" (p. 150). For this purpose, Easton (1966) recommends focusing on two major inputs: demands and support. "Through them, a wide range of activities in the environment can be channeled, mirrored, summarized, and brought to bear upon political life," he wrote, and "Hence, they are key indicators of the way in which environmental influences and conditions modify and shape the operations of the political system" (p. 151). As inputs to a system, demands and supports can be of different types: material and political demands, as well as material and political supports. Easton (1965b) cites expressions of opinion and calls for a decision as examples of demands. A flood may create grievances that lead to demands for building a dam. The conventional way of making demands is to make individual requests, write letters, and carry out other forms of lobbying. More unconventional approaches to making political demands would be to demonstrate or picket. As citizens, through letters, polls, or voting, voice agreement with a decision to build the dam, they provide political support. The willingness to pay taxes to build the dam is also a form of support. Demands and supports are closely interrelated. Easton states that "by the very act of voicing a demand or proposing it for serious discussion, a member will imply that he supports it in some measure" (p. 51). By examining the changes in the inputs of demands and support, analysts can determine the effects of the environmental systems transmitted to the political system.

Similarly, outputs help interpret "the consequences flowing from the behavior of the members of the system rather than from actions in the environment" (Easton, 1966, p. 151). Since the activities of members of the system have an impact on their own subsequent actions or conditions, those actions that flow out of a system into its environment cannot be ignored. Because a great amount of activity takes place within a political system, it is useful to isolate those elements that are important in understanding the system. One way of doing this is to examine the impact of inputs (reflected as demands and support) on political

outputs. Easton defines political outputs as the decisions and actions of the authorities. A government's decision to build a dam would be a political output; the actual building of the dam would be a material output.

This approach was a departure from previous research that examined the complex political processes internal to a system in terms of who controls whom in the various decision-making processes. While the pattern of power relationships helps to determine the nature of the outputs, the outcomes of internal political processes are most useful in tracing the consequences of behavior within a political system for its environment.

Easton (1966) claimed that "outputs not only help to influence events in the broader society of which the system is a part, but also, in doing so, they help to determine each succeeding round of inputs that finds its way into the political system" (p. 152). By identifying this "feedback loop," analysts can explain the processes the system can use to cope with stress and make recommendations that alter the system's future behavior. Easton describes the feedback loop as consisting of "the production of outputs by the authorities, a response by the members of the society to these outputs, the communication of information about this response to the authorities, and finally, possible succeeding actions by the authorities" (p. 152). For actions to be taken to satisfy demands or create conditions that will do so, information must be provided to authorities (those people who speak on behalf of the system) about the effects of each round of outputs. Since a drop in support is an important source of stress, information feedback to these authorities is crucial so that they can "bolster the input of support for themselves or for the system as a whole" (p. 152). Information about the consequences of each round of outputs and about the changing conditions that impact members is essential because it enables authorities to take action to keep support at a minimal level. Appropriate response to the feedback process can have "a profound influence on the capacity of a system to cope with stress and persist" (p. 152).

Criticisms of Systems Analysis

Criticisms of systems analysis have focused mainly on three areas: methodological weaknesses of the approach, the lack of suitability for empirical research, and strong political bias (Mitchell, 1968; Susser, 1992). Some critics claim systems analysis is misleading because it assumes that "reality 'really' consists of systems." This view suggests that "societies consist of far more individual and isolated events than systems [analysis] is capable of handling" (Mitchell, 1968, p. 477). Another aspect of the criticism is that identifying boundaries and variables in the system is difficult, thus making it hard to formulate operational definitions and perform empirical research. Furthermore, critics claim that the concept of equilibrium cannot be operationally defined except perhaps in terms of economic behavior. Finally, although the inputs and

outputs can be readily identified, they may not have been adequately studied.

Bernard Susser (1992) indicated that Easton's brand of "input-output" analysis is used very little in actual research, and when it is used, "its contribution turns out to be more terminological than real" (p. 185). The problem is that it is practically impossible to study a system without looking at the past. Without understanding the system's development and its historical strengths and weaknesses, it would be difficult to tell whether an event is a crisis or a normal situation.

While systems theory generally is regarded as being supportive of the status quo and thus conservative in its nature, it is interesting to note that at the time Easton proposed systems analysis for politics, many people considered it as having a liberal bent. The 1960s was a time when behavioralists made great contributions to research in many fields. Conservatives looked at systems analysis as value-laden based on strong conceptualizations as opposed to neutral impassionate science. In addition, looking at political systems as equilibrium seeking, self-balancing entities also suggested clear ideological biases. However, systems analysis had none of the "stress, contradiction, conflict, and imbalance [that] characterize the 'normal' condition of the modern state" (Susser, 1992, p. 186) proposed by Marxists. Easton's system's "normal" state was one of "adaptive dynamic stability" (Susser, 1992, p. 186).

Structural Functionalism

The terms *functional analysis* and *structural analysis* have been applied to a great variety of approaches (Cancian, 1968; Merton, 1968). With their broad use in the social sciences has come discussion of the appropriateness of the use of structure and function and the type of analysis associated with the concepts (Levy, 1968). The functional approach is used more often than any other method in the study of Western political science (Susser, 1992). The professional literature is full of references to the "functions" of political systems and to the relation between structure and function. Sometimes the terms are used without a clear understanding of the meaning of the functionalist position, more as linguistic fashion. This section deals with the theoretical implications of structural functionalism and its relationship to political science.

Although structural functionalism predated systems theory, it still presupposes a "systems" view of the political world. Similarities link functionalism to systems analysis. Susser (1992) writes that both focus on input-output analysis, both see political systems as striving for homeostasis or equilibrium, and both consider feedback in their analysis. Yet functionalism is significantly different.

History of Structural Functionalism

Structural functionalism has a lengthy history in both the social sciences (Merton, 1968) and the biological

sciences (Woodger, 1948). Functionalism's history goes back to Aristotle's study of ultimate causes in nature or of actions in relation to their ends, or utility. Developed in 17th-century France, Montesquieu's doctrine of separation of powers is based on the notion of functions that are best undertaken separate from each other as a means of ensuring stability and security.

Functionalism became important when Darwin's evolutionary theories began to influence thinking about human behavior. Darwin conceived of the idea of survival in functional terms. Each function was important to the survival of the whole system. Systems that could not adapt their functions ceased to exist. Other students of human behavior borrowed these ideas, applying them to social affairs. Thus, social Darwinism imported these same functionalist categories into social analysis. Social Darwinists claimed that society benefited from unrestrained competition between units, that functional adaptability was required for survival, and that attempts to protect the weak hampered the functioning of society as a whole. These ideas first influenced anthropology and then sociology. Implicitly through the works of Émile Durkheim and explicitly through Parsons (1951) and Robert Merton (1968), these ideas became central to the social sciences. Almond's "Introduction" to *The Politics of Developing Areas* (Almond & Coleman, 1960), applied functionalist ideas to political life.

Susser (1992) indicates that the analogy of human social life is organic, not mechanical. Mechanical analogies imply a certain "looseness of association" (p. 203) between the parts. While the parts of a motor function as a unit, parts can be easily removed and replaced, making their union less essential and the ability to exist autonomously less likely. In the organic analogy, "Individual elements depend on the whole for their maintenance" (p. 204). Functionalists tend to view social and political units in more holistic, organic terms. "Social practices are said to have a functional role in sustaining the system as a whole" (p. 204). Functionalists equate structure to anatomy and functions to the physiology of organisms.

When only structural categories are used to make political comparisons, "The comparative analysis of political systems breaks down as the difference between compared structures increases" (Susser, 1992, p. 205). For example, the structures between a Western democracy and an African tribe are so very different as to make comparison difficult. However, functions are much more comparable. Although a prime minister and tribal chief are difficult to compare institutionally, they nevertheless serve many similar functions. Although the structures of political rule may be very dissimilar, the functions that political systems perform are universal. Although undeveloped political systems assign numerous functions to a single person or institution, in more developed political systems, the same functions may be performed by many individuals or institutions. One of the primary areas of study in functionalism is the "interplay" between the dynamic functions of a system and the more static structures it designs for itself.

Varieties of Functional Analysis

Most functional approaches share one common element: "an interest in relating one part of a society or social system to another part or to some aspect of the whole" (Cancian, 1968, p. 29). Three types of functionalism exist within this approach, and most functional analysis contains all three. The first is based on the concepts and assumptions of sociology; the second, on the supposition that social patterns maintain the larger social system; and the third, on "a model of self-regulating and equilibrating systems" (p. 29).

Francesca M. Cancian (1968) describes two distinctive types of functional analysis: traditional and formal. *Traditional functional analysis* is the most commonly used. It is based on the premise that all social patterns work to maintain the integration and adaptation of the larger system. Two attributes further distinguish traditional functional analysis from other forms of analysis. First, a social pattern is explained by the effects or consequences of that pattern, and, second, these results must be beneficial and necessary to the proper functioning of society. Researchers take one of two tacks when using traditional functional analysis. They may examine only a few aspects of society at a time and attempt to link one social pattern with one need and thus explain the pattern. Alternatively, they may deal with more complex systems, trying to show how these elements are interrelated so as to form an adaptive and consistent system.

Formal functional analysis is called *formal* because it does not include a theoretical orientation or a substantive hypothesis about events. Rather it examines the relationships between elements. It contrasts with the traditional type of analysis in that its proponents reject the attributes of "integration" and "adaptation" in favor of an examination of the equilibrating or feedback functions in systems. The effects of a trait are used to explain the system rather than the trait. No restrictions exist on the kinds of consequences that are considered. Consequences may or may not be beneficial or necessary for society.

Cancian (1968) provides an example to contrast the two types of analysis with the nonfunctionalist approach. A nonfunctionalist would explain adolescent rebellion by examining the causes of the rebellion. A traditional functionalist would explain the effects or functions of the rebellion. A formal functionalist would focus on the equilibrating or feedback systems and not on the relationships of one-way effect or cause. In practice, Cancian noted, these approaches are usually combined. Almond and Coleman (1960) rejected traditional analysis, adopting a more formal approach.

Applying Functional Analysis to the Study of Politics

According to Michael G. Smith (1966), four approaches are useful in the comparative study of political systems: process, content, function, and form. Studies based on

process and content face huge obstacles. In developed countries, the processes of government are “elaborately differentiated, discrete and easy to identify,” but in simpler societies, the same processes are “rarely differentiated and discrete” (p. 114). They occur within the context of institutional activities that are difficult to analyze for political processes. The more “differentiated and complex” the government processes, the “greater the range and complexity” (p. 114) of content. Since content and process are “interdependent and derivative,” they require independent criteria for studying government (p. 114).

The functional approach does not have the same limitations as process and content. It defines government as all those activities that influence “the way in which authoritative decisions are formulated and executed for a society” (Easton, 1957, p. 384). From this definition, various schemata were developed to study the functions of government. Easton listed five modes of action as elements of all political systems: legislation, administration, adjudication, the development of demands, and the development of support and solidarity. These were grouped as input and output requirements of political systems. According to Almond and Coleman (1960), the required inputs are political socialization and recruitment, interest articulation, interest aggregation, and political communication. As outputs, he identified rule making, rule application, and rule adjudication.

In 1960, Almond and Coleman were the first to compare the political systems of “developing” areas systematically according to a common set of categories. To do this, they felt, they could no longer rely on the comparative approaches used to study governments in Western Europe. To find concepts and categories appropriate for use in comparing developing countries, they turned to sociological and anthropological theory (Almond & Coleman, 1960). Rather than adding new terms, they adopted and adapted an old vocabulary to a new situation. Instead of the concept of *state*, which would be limited by legal and institutional meanings, they used *political system*; instead of *powers*, with its legal connotations, they preferred *functions*; instead of *offices*, they used *roles*; instead of *institutions*, which directs thinking toward formal norms, they used *structures*; and instead of *public opinion* and *citizenship training*, they preferred *political culture* and *political socialization*.

In order to develop a system of categorization for all societies, regardless of size and culture, Almond and Coleman (1960) had to modify their definitions of politics and political systems. They felt the definitions of politics that identified societal functions as integration and adaptation were inadequate in describing their concept of political systems. Instead, they borrowed from Max Weber’s concept of state and Easton’s view of power. Easton (1953) offered a definition with three components: “The political system allocates values by means of policies; the allocations are authoritative; and its authoritative

allocations are binding on society as a whole” (p. 130). Almond and Coleman (1960) sharpened Easton’s definition of authority by building in Weber’s notion of *legitimate physical compulsion*. They viewed the political system as “the legitimate, order-maintaining or transforming system in society” (p. 7).

With the concepts of input and output, Almond and Coleman (1960) moved from a definition of *political* to that of *system*. They saw in the notion of *system* properties that interpret interactions of society, whereas *political* separated out the interactions in order to relate them to other concepts. Among the properties were comprehensiveness, interdependence, and the existence of boundaries. Systems analysis was comprehensive because it included all interactions, both inputs and outputs. It was interdependent because change in one subset of interactions would change others. The political system has boundaries in that there are points where it begins and points where it ends and other systems take over.

Political systems have common properties, according to Almond and Coleman (1960). First, all political systems, even the simplest, have political structure. Second, the same functions are performed in all political systems. Third, all political structure is multifunctional, whether in primitive or in modern societies. Finally, all political systems are “mixed” systems in the cultural sense. No society is strictly modern or only primitive.

As stated previously, Almond and Coleman (1960) listed seven functions of all political systems: political socialization, interest articulation, interest aggregation, political communication, rule making, rule application, and rule adjudication. The first four belong to the input side of a system’s functioning, and the last three to its policy outputs. Political communication links inputs to outputs in a way that provides the function of a feedback loop. Whereas Easton’s systems analysis deals primarily with “demands and supports,” Almond and Coleman’s categorization of inputs and outputs in the political system is much more extensive and in fact has led to a multifaceted approach to the study of politics.

In their study of political systems, Almond and Powell (1966) considered the activities or functions from three points of view: the conversion functions of interest articulation, interest aggregation, political communication, rule making, rule application, and rule adjudication; the operation and capabilities of the political system in its environments; and the way in which political systems maintain or adapt themselves to pressures for change over the long term. These latter functions referred to the maintenance and adaptation functions of political recruitment and political socialization.

An Example of the Functional Approach

Many of Almond and Coleman’s (1960) categories have become unique fields of study. For example, Fisher’s

research on mass media's effect on political decision making drew on Almond and Coleman's categories and mass media functions to develop a taxonomy of media functions in policy making (Fisher, 1991; Fisher & Soemarsono, 2008). Whereas the systems view often refers to the "non-descript conversion process" (Susser, 1992, p. 206), the functionalist approach deals explicitly with the steps involved from articulating requirements to fulfilling political outputs.

To show how structural functionalism fits within systems theory, Fisher's studies of mass media functions in policy making are examined (Fisher, 1991; Fisher & Soemarsono, 2008). Those studies found 14 media functions within six policy stages (Almond & Powell, 1966; Dunn, 1981; Jones, 1977; Wirt & Mitchell, 1982). To arrive at the 14 media functions in the policy process, Fisher adapted Lambeth's (1978; see also Fico, 1984) 10 media functions. Within Stage 1, problem identification and articulation, were found two media functions: (1) identification of problems by media and (2) relaying of problems to the public. Within Stage 2, policy recommendation and aggregation, the media were found to function in three ways: (3) identification of groups and proposals, (4) identification of policymaker proposals, and (5) media suggestions of content. In Stage 3, policy decision and adoption, the media functioned by (6) setting the tempo of decision making, (7) recommending how to vote, and (8) informing the public of content. Within Stage 4, policy implementation, the media functioned by (9) describing administration and (10) alerting the public to problems. Within Stage 5, policy evaluation, were found the media functions of (11) evaluating effectiveness and (12) reacting to policy. Finally, within Stage 6, policy resolution or change, were found the media functions of (13) stimulating review and (14) proposing change or termination.

In his study of lawmakers' use of reporters, Lambeth found that reporters were more influential in the five functions involving their potential impact in transmitting information to the public than in the functions involving personal or professional influence in the legislative setting. Fisher (1991; Fisher & Soemarsono, 2008) used content analysis in his study of mass media functions to determine the role of the media in informing or persuading the public and policymakers. Fisher confirmed Lambeth's finding that reporters are more influential in functions involving transmittal of information to the public and less important in functions involving personal and professional influence in the legislative setting. In addition, the study seemed to bear out Lambeth's conclusions that the impact of the press on elected officials is low to moderate.

Fisher (1991) provides an example of the relationship among systems, structures, and functions. While the policy stages are functions in the political system, they also provide structure for the media functions. The first two provide input functions in the political system. The next is a process function. The last three serve as output functions.

Terminology Used in Structural-Functional Analysis

Structural-functional analysis is made more difficult because of the confusion of terms. The difficulty in speaking about structural functionalism comes from five sources, according to Levy (1968). First, the feeling exists that structural-functional analysis is something new, when in fact it is as old as the scientific method. Second, definitions are messy because terms are unclear and refer to more than one thing. Third, many researchers make the mistake of believing that final causes can be found from their work. They assume that it is possible to find the purpose and design of the phenomena they study. This is a fallacy called *teleology*. Fourth, researchers assume that the methodology is tried and proven, when in fact models of analysis are often misunderstood and misconstrued. Finally, researchers have allowed bias to seep into their work. Unintentionally they have written evaluative approaches into their analysis, thus raising questions about objectivity.

Structural functionalism is a synonym for *scientific analysis* in general and as such has existed long before the adoption of the name *structural functionalism* in the social sciences. In the biological sciences, for example, the study of structure and function has a long history. Structural functionalism analysis consists of nothing more than stating empirical questions in one of the following forms or some combination of them: (a) What observable uniformities (or patterns) exist in the phenomenon under study? (b) What conditions result because of the phenomenon? (c) What processes occur as a result of the conditions? The first question asks: What structures are involved? The second: What functions have resulted because of the structures? Asked in the opposite direction, different results could occur: What functions exist? What structures result from the functions?

Function and Structure

Another problem, according to Levy (1968), is that the general concept of structure has many different referents, in both the biological and the social sciences. Joseph Woodger (1948) in biology and Merton (1968) in the social sciences have pointed to the abundance of referents given to the term *function*. This has led to a lot of confusion. Much of the literature is preoccupied with function, whereas structure has been discussed less. *Function* may be defined as any condition or state of affairs resulting from an operation of a unit of the type under consideration in terms of structure. In the biological sense, the unit is an organism or subsystem of an organism. In the social sciences, the unit is usually a set of one or more persons (actors). *Structure* may be defined as pattern or observable uniformity in terms of the action or operation taking place. In the social sciences, the focus of analysis has been on the

structure of societies and other social systems or the structures (patterns) of actions in general.

Classification of functions or structures depends partly on point of view. What is function from one point of view may be structure from another. Levy (1968) gave examples of this confusion. The manufacture of automobiles is production from the point of view of the automobile user but consumption from the point of view of the steelmaker. Functions in this sense are patterns or structures or have important structured (patterned) aspects, and all structures are the results of operations in terms of other structures, so they are in fact functions. The politeness of children may be considered a structure of their behavior or a function in terms of the structures (patterns) of parenting.

Requisites and Prerequisites

Functional and structural requisites are useful in the analysis of any unit. A *functional requisite* may be defined as “a generalized condition necessary for the maintenance of the type of unit under consideration” (Levy, 1968, p. 23). Functional requisites respond to the question: What must be done to maintain the system at the level under consideration? A functional requisite exists if its removal (or absence) results in the dissolution of the unit or the change of one of its structural elements.

A *structural requisite* may be defined as a pattern of action (or operation) necessary for the continued existence of the unit (Levy, 1968). To discover structural requisites, ask: What structures must be present so that operations will result in the functional requisites for the unit? Functional requisites answer the question: What must be done? Structural requisites are answers to the question: How must what must be done be done?

According to Levy (1968), *structural functional requisite analysis* includes the following steps: (a) Define the unit of phenomena to be studied, (b) discover the setting, (c) discover the general conditions (or functional requisites) that must be met if the unit is to persist in its setting with change or alteration of structures, and (d) discover what structures must be present to maintain the system.

Functional and structural prerequisites must preexist if a unit is to come into existence. Sometimes the requisites and prerequisites may be similar or identical. On the other hand, the requisites and prerequisites may not coincide. For example, the structures that must be maintained in order for the United States to continue as a highly modernized society are not the same as those that have to preexist for Nigeria to become highly modernized. However, the structures may be similar if one looks at the United States at the beginning of the 19th century (Levy, 1968).

Concrete and Analytic Structures

Failure to distinguish between concrete and analytic structures may result in the *fallacy of reification* (or

misplaced concreteness). For example, the terms *economy* and *polity* cannot occupy the same position in system analysis as the term *family*. Family is an example of a concrete structure, as are business firms, governments, and societies. In *concrete structures*, the units are capable of physical separation from other units of the same sort, and membership is easily defined. In *analytic structures*, no concrete separation of units is possible. For example, no social system is without economic and political structures (Levy, 1968).

Institutions, Traditional Structures, and Utopian Structures

Although these terms are sometimes used interchangeably, they refer to different types of structures. Institutions are structures with normative patterns with which conformity is expected, and failure to conform is sanctioned or met with indignation. The structure becomes a requisite of the system. The structure does not change without destroying the structural requisite. For example, age and role are tied together in all societies. If the requisite age changes for certain roles or functions, the structure would also change.

Traditions are *institutionalized* as the structure is perpetuated to the extent that changes in functions do not have an effect on the structure. Tradition is a *double institution*, according to Levy (1968): “The structure concerned is an institution and the perpetuation of the structure is also an institution” (p. 27). Important traditions may vary in conformity and sanctions. The tradition of driving on the right-hand side of the road would not have the same level of sanctions as the tradition against incest.

Utopian structures, although they may not be institutionalized, still require adherence as institutional ideals (Levy, 1968). The principle “Love thy neighbor as thyself” is an ideal that is institutionalized in some social contexts. Its perpetuation is also institutionalized. Utopian structures allow the teaching of societal norms and the perpetuation of structures.

Ideal and Actual Structures

Members of a society establish ideal structures to determine how they should behave, whereas actual structures are patterns of how they do behave. Although sometimes the ideal and the actual coincide, more often they do not fit perfectly. This difference in fit causes stress in the social system. Only with perfect knowledge and perfect motivation would there be a perfect fit between the ideal and the actual structures.

Criticisms of Structural Functionalism

Critics of structural functionalism view it as “a translation of Anglo-American political norms in methodological

terminology” (Susser, 1992, p. 207). Structural functionalism may be in decline as a methodological approach for the study of politics; however, it leaves a set of terms that are still used in political jargon. Some of those in the functionalist camp (Merton among them) rejected the notion of this decline. “Much of what was best in the political research of an entire generation was couched in its terms” (Susser, 1992, p. 207).

One of the main criticisms of structural functionalism is that its categories were “too undifferentiated to be of real help in actual research” (Susser, 1992, p. 206). Although Almond’s functional taxonomy has greater specificity and serviceability than the systems approach, it is seen as not much more than a translation of familiar and known phenomena into blandly broad categories. As such it promotes “a terminological rather than an essential transformation in the discipline” (Susser, 1992, p. 206).

Another criticism is related to the methodological approach used in functionalism. A list of functions is created deductively and then appropriate structures are identified. In some cases, this approach leads to “empirical contortions” to satisfy the framework. This criticism applies to much academic research, leaving the researcher, rather than the approach, responsible for assuring research validity.

A final criticism, according to Susser (1992), is that functionalism “harbors an ideological slant” (p. 207) that sustains existing structures. It describes what exists rather than what ought to be, thus maintaining the status quo.

As if anticipating this criticism, Almond and Powell (1966) responded to the criticism that functional-systems theories imply “an equilibrium or harmony of parts” and “that they have a static or conservative bias” (p. 12). Political systems are not necessarily harmonious or stable, they wrote, but interdependent. The task of political science research is “to ascertain how change in any one of the parts of a political system affects other parts and the whole” (p. 13). They built political development into their approach to the study of systems. They look at political systems “as whole entities shaping and being shaped by their environments” (p. 14). To understand the processes of political development, they examine the interaction of the political system with its domestic and international environments.

Conclusion

The study of structural functionalism and systems theory had its heyday with the works of Easton (who examined political systems), Merton (noted for his study of social structure), and Almond and Coleman (who developed a taxonomy of political functions within political systems). A majority of political studies from that period used systems theory and structural functionalism as their framework (Susser, 1992). While few researchers today claim a framework based on

these theories, the approach is still alive and well (Charnock, 2009; Fisher & Soemarsono, 2008; Fisk & Malamud, 2009; Mohamed, 2007; Scheuerell, 2008). Understanding politics requires political syntax, much of which continues to be based on structural functionalism and systems theory.

POLITICAL DEVELOPMENT AND MODERNIZATION

SARAH WILSON SOKHEY

The Ohio State University

To eat and to talk—to be free from hunger and repression: These elementary values animate a worldwide quest for political democracy and economic rationality.

Adam Przeworski (1991)

Political science has long been concerned with how to establish systems allowing us “to be free from hunger and repression.” *Political development* implies that some governments are better at accomplishing these goals than others are. Although we should be careful not to idealize democracy with all its imperfections—and indeed Samuel Huntington would remind us that political order matters more—many agree that democracy in some form is preferable to the wide array of nondemocratic systems of government. *Modernization* refers to economic development and the transformation from agricultural to industrial societies, along with corresponding social and cultural shifts (although the use of terms such as *modern* and *primitive* has been criticized as inappropriately stereotyping certain cultures from a Western perspective).

The central question of how economic conditions are linked with the emergence of democracy or dictatorship has been a topic of interest from the time of ancient scholars through contemporary political science. Aristotle noted that

democracy could not function well in a society in which a large proportion of the population lived in poverty.¹ In a study of early American democracy, Tocqueville (1835) also noted that democratic systems would suffer in societies with great economic inequality; where inequality and democracy coexisted, class cleavages would define politics and the poor would vote to redistribute wealth from the rich.² Reacting to the spread of Communism around the world beginning in the 1950s, scholars and politicians in democratic countries concerned themselves with the necessary prerequisites of a democratic society, including economic factors, in order to predict which countries were likely to become or stay democratic. On the collapse of many communist regimes in the early 1990s, our attention again turned to explaining the relationship between economics and politics as countries struggled to transition to democracy and to market-based economies simultaneously. Questions about the prerequisites for successful democracy have continued to be relevant more recently in countries such as Iraq and Afghanistan.

This chapter traces the study of political development and modernization. First, it discusses the origins and development of *modernization theory*, which encompasses a set of explanations linking economic, social, and cultural changes with shifts in political systems. Modernization theory is a starting point for understanding how contemporary political scientists approach this topic. It puts forth the notion that economic development leads to social and cultural changes that alter the political behavior of citizens and ultimately result in democratic governments. Second, the chapter turns to the empirical evidence supporting modernization theory and critiques of the theory's larger applicability around the world. Critics suggest that some types of economic development might actually prove to be destabilizing, rather than advancing the social and cultural elements that provide the foundation for democratic societies. Others have suggested that although wealth does not explain the emergence of democracy, the odds of a country's remaining democratic are higher in richer countries. Third, this chapter reviews the policy implications of what scholars have learned about the connection between economic and political changes. Finally, it looks to future directions in research on political development and modernization.

Modernization Theory

Modernization theory refers to a group of explanations linking economic development and accompanying social transformations with the type of political system that emerges. The basic story of modernization theory is as follows: As countries modernize economically, they transition from agricultural to industrial societies. Industrialization results in urbanization, which means that more of the population lives in cities in which they have greater access to information, media, and education. Increasing economic wealth, which accompanies industrialization, results in a growing middle class that begins to participate more in politics and make demands on the government. Ultimately, the resulting changes in mass political behavior make the emergence and survival of democratic governments more likely. The emphasis in this branch of research is on the stages of development from more traditional to more advanced societies. Countries are all on a similar path, but some countries are further along than others, and ultimately we should expect to see all countries develop democratic systems, albeit at different rates. For instance, in *The System of Modern Societies*, Talcott Parsons (1971) examines the development of the state in the context of Western Europe, detailing how societies evolve from traditional to modern ones.

Critically, these early sociological explanations of modernization were based almost exclusively on the Western European context. As economic development progressed according to Western trends such as industrialization, politics would change as well. Karl Deutsch

(1953, 1961) suggested that socioeconomic development alters mass behavior in politics. In doing so, Deutsch developed the concept of *social mobilization*, a critical component of the modernization process. Social mobilization denotes changes happening in a large portion of a society as it transitions from being traditional to being modern. For instance, as countries industrialize and rely less on agricultural production, urbanization provides individuals and groups with the exposure to information and the resources with which to participate in politics. Urbanization, education, and the development of new social networks and roles in society are all part of social mobilization, which, ultimately, leads individuals to make new demands on their governments. Deutsch notes, however, that the democratic participation resulting from social mobilization might manifest as communal riots and civil wars, not the peaceful types of participation, such as voting, that we typically associate with democracies today. In whatever form it takes, mass political participation should threaten the continued existence of governments that do not respond to citizens, thereby paving the way for more democratic societies.

In keeping with the important role of social mobilization in development, the effects of modernization alter how citizens view themselves in connection with the state. In *The Passing of the Traditional Society*, Daniel Lerner (1958/2000) uses a case study of a Turkish village to examine the effects of the transition from a "traditional" to a "modern" society. Lerner concludes that modernization—through exposure to mass communication, increasing literacy, and new transportation networks—profoundly alters the way that individuals see themselves in the state. Individuals go from seeing themselves as subjects of the state to citizens who have the leverage to make demands on their rulers.

Seymour Martin Lipset (1959, 1960) argues that modernization is likely to spur the establishment of democracy as well as its survival. As countries develop economically, they also become more complex, and in particular, the development of a stronger middle class will allow for the development of a more politically active civil society. Lipset notes that education is likely to encourage the development of citizens who are aware of their government and are more likely to participate by making demands. Even in developed countries, we know that more educated citizens are more likely to participate (although the effect of individual education and wealth on political participation varies by country). Through this process, governments will be forced to make concessions to the empowered and increasingly politically aware middle class, or the regimes will fall due to uprisings. These concessions will eventually produce democracies.

The middle class was thought to be a critical component of the modernization process such that, in explaining the origins of democracy, Barrington Moore (1966) concludes, "no bourgeois, no democracy" (p. 418). One example of the critical role played by the middle class can be seen in

the English state-building process. The development of wool manufacturing in England created an increasingly wealthy middle class. Sheep were easier to hide from the state than resources such as land, making the taxation of the wool industry difficult. To successfully collect revenue, the English state was forced to make concessions to the middle class, which in turn spurred the development of a different type of citizen–state relations. Thus, the development of an empowered middle class was the beginning of a more democratic basis of government in which citizens had more influence.

Dietrich Rueschemeyer, Evelyn Stephens, and John Stephens (1992) offer a twist on class-based explanations, arguing that it is not an expansion of the middle class, but rather a shift in the balance of power among the classes, that explains democratization. When economic changes weaken the powerful upper class in relation to subordinate classes, democratization will occur. In a notable departure from traditional modernization theory, they conclude that the middle class often opposed further democratization after having gained some initial concessions from the state. Carles Boix (2003) also argues that it is not the growth of the middle class alone, but the balance of power among social classes, the nature of economic resources, and the distribution of wealth that influence the formation of democracy. Nonetheless, even by these different accounts, class politics and the middle class play a central, if not exclusive, role in changes in the political system.

Building on modernization theory, scholars have also suggested that democracies emerged and succeeded when certain norms and beliefs were present. The idea that certain norms are necessary for democracies to function well suggests an important qualification to modernization theory. If socioeconomic changes do not alter the beliefs and norms of citizens, then we should not expect modernization to increase the likelihood that a successful democracy will be established.

In seeking to understand the cultural basis of democracy, political scientists began to bring survey research into the discipline. *The Civic Culture*, by Gabriel Almond and Sidney Verba (1963), is a seminal study in comparative political behavior and relies on survey research. They argue that a certain set of beliefs makes it likely that a country will be able to establish a well-functioning democratic system of government. According to Almond and Verba, democracies flourish in pluralistic cultures based on communication and persuasion, consensus building, diversity, and representation in governing bodies. They identify three types of citizens—parochials, subjects, and participants. *Parochials* are those who are completely politically unaware; *subjects* are politically aware and are subservient to the state but do not participate; and *participants* are politically aware and actively engage in the political system through activities such as voting. Democracies have the largest number of participants. The least developed systems have many parochials, as in a feudal system or very poor, nondemocratic countries in

which citizens have little awareness or knowledge of the government. Other nondemocratic systems, such as communist ones, may ensure that citizens are aware of the state's presence and power (thereby fostering subjects) but do not allow for the meaningful participation that is associated with participant citizens.

Almond and Verba support their claims using survey evidence from the United States, the United Kingdom, Germany, Italy, and Mexico (ranked from the most to the least democratic country). For instance, they explain differences in the histories of British and German democracies by pointing to the presence of different types of citizens. Both countries had histories of deference to political leaders, but the United Kingdom became the epitome of democracy, whereas Germany saw the rise of a fascist political system with the Nazis. Almond and Verba's argument was that the British state did not have a history of maintaining the same exhaustive power over its people as existed in Germany; as a result, British citizens were more resistant to fascist measures than Germans were. Nearly 30 years after *The Civic Culture*, Ronald Inglehart (1990) again conducted surveys to establish the underlying cultural aspects of democracy. Using survey evidence from 25 industrial nations in the 1980s, he found that certain social characteristics, such as high levels of interpersonal trust and support for gradual change in society, are correlated with more stable democracies.

Survey research such as that done by Almond, Verba, and Inglehart provided the basis for broader studies of political culture, including the World Values Survey at the University of Michigan, which tracks opinions on social and political questions in more than 80 countries around the world. However, there is an important question of causality in applying such studies to understanding the origins of democratic societies. We do not know whether these values produce democratic societies or whether democratic societies foster citizens with these values. Consider again the example of the United Kingdom's remaining a democratic country while Hitler's fascist regime was able to come to power in Germany. Almond and Verba argue that the civic culture was stronger in the United Kingdom, thereby precluding fascist developments. However, we do not know what determined the type of citizen in the first place. Political institutions are as likely to shape citizens as citizens are to shape their institutions. If the type of citizen determines the nature of the political system and the nature of the political system shapes citizens, then this explanation is circular and unhelpful.

Despite the difficulties of assessing causality from this survey evidence, such research suggests an important qualification to modernization theory by identifying the presence of different political beliefs in different systems. This research suggests that if one wants to promote successful democratic societies, one should pay attention not only to economic growth but also to the promotion of certain norms and beliefs.

Applications, Empirical Evidence, and Critiques

Modernization theory has faced several serious criticisms. The terminology used in modernization theory has been criticized in part because it assumed that *lesser* developed countries were simply more *primitive* than countries such as the United States and those in Western Europe, implying that lesser developed countries should end up looking like Western governments. Substantive objections have been raised as well, including dramatically different explanations of the connection between economic and political developments. The more enduring criticisms, such as the destabilizing effects of modernization, emerged from a consideration of a wider range of cases. Other counterexplanations, such as *dependency theory* (discussed below), have now been rejected because they were largely based on the experiences of a few Latin American countries during a specific era.

Political Order in Changing Societies

One of the major challenges to modernization theory was posed by Huntington (1968) in *Political Order in Changing Societies*. Huntington noted that economic modernization and political development are not synonymous but rather are distinct processes. Furthermore, economic development and the rapid social changes accompanying it are as likely to result in the political decay of societies as in their development. Instability is most likely to occur in the early stages of modernization, or when there is growth followed by sudden setbacks. If socioeconomic changes lead to rapid social mobilization that outpaces the development of political institutions, then decay will certainly occur. Huntington went so far as to suggest that political order trumped other concerns, producing the controversial view that stable authoritarian systems would be preferable to unstable democratic ones.

By some accounts, Huntington “killed off modernization theory” by highlighting the destabilizing effects of rapid development.³ However, although Huntington’s work created debate about the consequences of economic development, his explanation rested on an understanding of the link between social mobilization and economic development—two factors central to modernization theory. Therefore, although Huntington created a significant challenge to the then existing understanding of modernization theory, some scholars would nonetheless classify him as a *modernizationist*, albeit one who emphasizes the importance of political institutions.⁴

Dependency Theory

In economics and the social sciences, modernization theory was originally developed through a comparison of Western European development with the less economically developed countries of Africa, Asia, and Latin America.

Economists and economic historians such as W. W. Rostow (1959) concluded that all countries would eventually reach a more advanced stage of development similar to that of the United States and countries in Western Europe. However, out of the Latin American context came one of the greatest challenges to modernization theory.

Dependency theory directly countered modernization theory, arguing that economic development might hinder social modernization and the emergence of democracy (but for reasons very different from those raised by Huntington). Dependency and modernization theory shared a similar topic of interest—why some states were developed while others lagged—but differed in their assumptions and approaches. While modernization theory focused on individual-level factors such as political behavior, dependency theory maintained that development could be explained only by considering a country’s historical role in the global political and economic system. In this sense, dependency theory represents a difference in approach (i.e., the factors it considers most relevant) rather than a distinct theory of global development.⁵

Support for dependency theory came from scholars studying Latin American countries who noted a cycle of weak countries being exploited by powerful countries in the international economy. In the 1960s and 1970s, the experiences of Latin American countries suggested that economic modernization—through integration into the world economy—might not be enough to produce stable growth or democratic systems. Scholars argued that, not only did development *not* promote democratization, but globalization put small states at an economic disadvantage in the larger international economic systems. This meant that developing countries would never experience stable economic growth because they were trapped in an inescapable dependence on wealthier nations.

In “The Development of Underdevelopment,” Andre Gunder Frank (1970) cites Chile and Brazil as examples of poor countries trapped in a cycle of economic growth that benefits richer countries but not the satellite territories that are the origins of production. This pattern of development began in the 16th century with Spanish conquest of the modern-day Chilean territory and Portuguese conquest of Brazil. While both countries went through periods of what appeared to be successful economic growth, their ultimate success hinged on how they fit into the larger international economy and whether there was foreign and domestic interest in the production of local economies. When international interest and subsequent financial investment waned, local economies foundered.

Today, dependency theory has been discredited because of a lack of evidence supporting its central arguments in other regions of the world or over long periods of time. Evidence refuting dependency theory emerged in the late 1970s, when Latin American economies in countries such as Argentina began to grow rapidly, breaking from the cycle of poverty on which dependency theory focused. Because dependency theory had predicted continued stagnation

where growth emerged, it was discounted as a credible explanation of the connection between political and economic development.⁶

Natural Resource Curse and Modernization Theory

Another shortcoming of modernization theory was its inability to explain the persistence of countries that were wealthy but not democratic. For instance, scholars refer to a *natural resource curse* in which countries with large amounts of natural resources (and which rely on those resources for a large proportion of state revenue) have difficulty in attaining stable economic growth or maintaining democratic systems of government.

In the title of her book, Terry Lynn Karl (1997) refers to the natural resource curse as “the paradox of plenty” faced by oil-rich countries. She studies several oil-rich countries—Venezuela, Iran, Nigeria, Algeria, and Indonesia—which are diverse on an array of political and social characteristics but share striking similarities resulting from their oil wealth. In these oil-rich states, politicians did not have incentives to think about the long-term economic efficiency of how they generated state revenue and distributed resources because there were strong incentives to give undue favoritism to the oil industry. The presence of large quantities of oil promoted political and economic systems that gave undue advantages to the oil industry at the cost of long-term economic efficiency (by investing more broadly in the economy). This meant that oil wealth promoted the development of centralized states, with the result that democratic processes, including widespread societal participation in politics, are unlikely to emerge. Karl refers to this problem as a kind of modern-day Midas touch, in reference to the mythical king who wished, at his own peril, that everything he touched would turn to gold.

The central risk factor for countries with the natural resource curse is that the economy relies primarily on a single commodity (or good), and this applies not just to oil. For example, Michael Shafer (1994) documents the problems posed by economies dominated by a single sector, including copper in Zambia, tea in Sri Lanka, coffee in Costa Rica, and light manufacturing in South Korea. Nor is the problem posed by natural resource wealth limited to a handful of countries. Some 75% of states in sub-Saharan Africa and more than two thirds of the countries in Latin America, the Caribbean, North Africa, and the Middle East depend on primary commodities for a minimum of half of their income from exports (Ross, 1999).

In relation to modernization theory, the existence of wealthy countries with stable dictatorships (or weak democracies) is very surprising. These oil-rich countries have proved to be stable nondemocratic systems, challenging the notion that wealth breeds a demand for rights and goods from the government that results in democracy. If modernization theory is correct, we should expect economic wealth to be associated with social and cultural

shifts that promote democratic systems of government. Thus, the existence of wealthy dictatorships—and the natural resource curse—is unexpected from the perspective of classic modernization theory. In particular, in keeping with modernization theory, we would expect the citizens of wealthy countries to become more educated, participate more in their own governance, and ultimately create the pressure for a more democratic system of governance in the world.

To explain this seemingly strange outcome, we must consider the consequences of economic growth from natural resources, in which Karl’s explanation of the paradox of plenty offers some insight. If Karl is correct that oil shapes the centralization of the state and creates incentives for the state to offer undue influence and privileges to the oil industry, this suggests that oil wealth does not promote the type of overall, long-term economic development that promotes democratization. Even though education may become more widespread and citizens may become increasingly exposed to the outside world, the state will maintain highly centralized power and will be dominated by one powerful interest group—the oil industry—such that democratic participation will be limited.

Consider the example of Iran. Iranian citizens have increasingly significant exposure to the outside world, particularly through the availability of satellite television offering antiregime perspectives and foreign news sources such as the Cable News Network (CNN) and the British Broadcasting Corporation (BBC). Dissent can also be seen in the emergence of independent newspapers and increasing Internet access in Iran. While the growth of these media outlets has prompted the state to react by expanding its own presence in satellite television, significant competing sources of information still exist.⁷ As such, modernization theory would predict that Iranian citizens should become increasingly interested in being politically active. Nonetheless, an Iranian democracy is not likely to emerge in the near future.

According to Karl’s argument, an important part of the reason Iran has not, and likely will not, become more democratic is that its reliance on oil for wealth has encouraged the development and persistence of state structures that are highly centralized and favor a small group of economic elites. There are, of course, other reasons that Iran is not democratic (including possible cultural reasons), but Karl offers one important reason that we would not expect political change there anytime soon. In this way, research on the natural resource curse makes a compelling case that even if education and media become more prevalent, states relying primarily on a single natural resource are unlikely to become democratic.

In reviewing existing approaches, Michael Ross (1999) points out several distinct theories for why oil-rich states have difficulty establishing democratic systems of government and notes that previous research on the natural resource curse does not offer insight into which theory is correct (factors that some theories, such as Karl’s, do not

acknowledge). One explanation is called the *rentier effect*, which proposes that governments give special privileges to the oil industry to avoid being accountable to the general population in order to stay in power. Another explanation is the *repression effect*, in which governments use oil revenue to develop their internal security, thereby repressing political participation and popular demands for public goods. Finally, there is a *modernization effect*, which harkens back to traditional modernization theory, arguing that oil wealth does not encourage the social and cultural shifts thought to underpin successful democracies (Ross, 2001).

Relying on statistical analysis of 113 countries from 1971 to 1997, Ross finds evidence for all three of these theories of why oil-rich states might not promote democracy. Notably, he emphasizes that the effects of the natural resources curse are not limited to the Middle East or oil-based economies. He finds not only that oil is bad for democracy but that the presence of large amounts of any mineral resource impedes democratic societies, as can be seen in countries as diverse as Angola, Chile, Cambodia, Congo, and Peru.

Research on the natural resource curse suggests that we must consider the type of economic development occurring and its specific consequences in order to understand the effect on democracy. Another explanation for the existence of wealthy dictatorships—which is consistent with Ross’s argument—is that wealth makes any political system less likely to change, whether that system is democratic or not. This means that wealthy dictatorships are likely to remain dictatorships and wealthy democracies are likely to stay democratic. This is the basic argument of *survival theory*.

Survival Theory

Modernization theory, having faced some significant objections, was brought back to life, at least partially, by proponents of survival theory. According to Przeworski and Limongi (1997), the problem with traditional modernization theory is that it observes that democracies tend to be wealthier than nondemocracies but cannot account for two conflicting explanations of this observation. On one hand, as countries become wealthier, they may become more likely to establish democratic governments. On the other hand, democracies may emerge regardless of the level of wealth but are more likely to last when they are wealthier. We would observe the same outcome—that democracies tend to be wealthier—in either case. Based on this outcome, we cannot simply assume, however, that wealth is the cause of democracy, because wealth may merely be the cause of democratic survival, not its emergence.

Przeworski and Limongi (1997) argue that rather than economic development’s being responsible for the emergence of democracy, wealth makes all political systems, including democracies and dictatorships, more likely to endure. If this is true, then we should expect democracies to arise irrespective of their level of wealth but to be less

likely to last when they are poor. Likewise, poor dictatorships are likely to face instability although not necessarily a transition to democracy. By this account, democracy “survives if a country is ‘modern,’ but it is not a product of ‘modernization’” (p. 159). Przeworski and Limongi conducted statistical analysis on an impressive data set of 135 countries from approximately 1950 to 1990, tracking when a country became a democracy or dictatorship, how long it lasted, and the levels of development and growth rates. Their findings reveal that as dictatorships become wealthier, a transition to democracy is more likely, but only up to a point. Once dictatorships reach very high levels of economic development, they are remarkably stable, and democracy is unlikely to emerge. Furthermore, Przeworski and Limongi found—contrary to what Lipset and Huntington would have predicted—that rapid growth is not destabilizing for democracies. Relatively poor countries with some economic growth are more stable than rich democracies that experience decline.

In summary, survival theory does not take a strong stance on the reasons countries become democratic in the first place, but rather it emphasizes that democracies arise regardless of the level of development (for whatever reason) but are more likely to be sustained when the level of wealth is high.

Summary of Lessons From Modernization Theory

Despite extensive study on the connection between politics and economics, scholars are still divided about the relationship between political development and modernization. One major reason for this uncertainty is that researchers often struggle with a dearth of data that is comparable across countries. Some measures of economic and political characteristics are available only for particular regions or periods, thereby limiting the scope of a project, or researchers may be interested only in specific regions. Przeworski and Limongi (1993) list some of the major studies, conducted from the early 1960s through the 1990s, that tried to determine the connection between democracy and economic development. These studies include as few as 10 underdeveloped countries or as many as 100 countries. Some studies are limited to a single region, such as Latin America, while others are more cross-national, including several regions. The time over which these countries were studied varies as well. The inevitable result of drawing conclusions based on different countries during varying time periods is a myriad of results, some of which are contradictory.

There are, however, a couple of lessons that we can draw from the wide array of research examining political development and modernization. First, economic growth is probably not necessary for the emergence of democracy. There is compelling evidence that democracy emerges at all levels of development. At a minimum, we can safely say that the economy alone does not predict democratization.

Second, economic growth may aid in the survival of democratic governments, but it is likely not sufficient. Other factors matter too, as evidenced by the so-called natural resource curse. For instance, excessive inequality may hamper citizens' ability to participate and may encourage the development of institutions dominated by a few powerful elite rather than an active civil society. Furthermore, Moore's (1966) central thesis is that only certain paths of modernization result in democratic systems. Robert Bates (1991) similarly lays out different paths of economic modernization, some of which explain the developments of historical Europe and others, the experiences of formerly socialist countries.

These lessons are hedged in probabilistic terms because much research remains to be done to definitively establish the political consequences of economic changes. One of the most important lessons that we can take from this research is that when explaining the connection between politics and the economy, we must fully consider the nature and pace of economic development and its specific consequences. Specifically, we must consider which groups are empowered or hurt by growth or decline, the incentives of the state and politicians under such circumstances, and the behavior of citizens. Only by addressing these intermediary links can we fully understand the connection between modernization and political development.

Policy Implications for Promoting Democratization

Research on political development and modernization has often been explicitly motivated by a desire to shape foreign policy, revealing a clear connection between academic theories and the policy realm. When writing *The Civic Culture* in the early 1960s, Almond and Verba were responding to the spread of Communism around the world and attempting to identify the necessary prerequisites for democratic systems. They even expressed concern that some Western European nations would fail to find a stable form of democracy. Likewise, Rostow's *The Stages of Economic Growth* was a guide for the U.S. Agency for International Development, which sought to formulate a policy to prevent the spread of Communism to South Vietnam and Indonesia. More recently, Huntington's *The Third Wave: Democratization in the Late Twentieth Century* (1991) includes sections devoted to advice for politicians seeking to establish democracies in their own countries.

Depending on which theories we accept, prescriptions for foreign policy and democracy promotion around the world change drastically. Modernization theory in its original formulation suggests that those interested in promoting democratization around the world should encourage countries to pursue policies of economic development as a minimum prerequisite for a democratic society. However, research suggests that the ways in which governments promote economic development will influence whether the

net effect actually promotes democratization. As suggested by survey research, economic growth alone may not be sufficient to produce democratic systems of government.

In *The Logic of Political Survival*, Bruce Bueno de Mesquita, Alastair Smith, Randolph Siverson, and James Morrow (2003) offer a different way of conceptualizing types of political regimes, and their approach has important implications for foreign policy. According to traditional definitions of democracy, countries are democratic if they hold free and fair elections and meet other important procedural requirements, including a free press and civil liberties. However, Bueno de Mesquita et al. put forth the *selectorate theory* and argue that the crucial characteristic for understanding how a government will behave lies in knowing to whom leaders are accountable. The *selectorate* are all those who have a say in the selection of the leaders (and that selection may or may not be through voting in democratic elections). The *winning coalition* is the group of individuals whose support is necessary for a leader to stay in power. For instance, in a democracy, the selectorate is very large, encompassing all possible voters, and the winning coalition consists of the majority necessary to win an election. In contrast, in a military dictatorship, the selectorate is likely to be a small group of officers, and the winning coalition is the minimum number of those officers necessary for the dictator to maintain power.

Distinctions between the size of the selectorate and the winning coalition are significant because they have important implications for the types of goods leaders will provide to their citizens. When there is a large winning coalition and a large selectorate, as in democracies, leaders have an incentive to provide public goods in order to maintain the support of the large proportion of the population needed to win elections. Conversely, when there is a small selectorate and a small winning coalition, it is more efficient for leaders to provide private goods to the small group on whom they rely for power.

This logic of political survival suggests that foreign aid—even if it is designed to promote economic growth—may have the reverse effect by providing dictators with resources that can be diverted to a small winning coalition rather than used to promote development. Foreign aid, therefore, may not be favorable to the type of economic development that promotes the establishment of democracy if it goes to a dictator who can pay off supporters. This is why it would not have been advisable to give foreign aid directly to Saddam Hussein, the former dictator of Iraq, who could have used it to his own ends and specifically to prop up support for his regime among his small winning coalition. Doing so would have made him and his few supporters more powerful without encouraging the growth of a middle class or the broader education of the population, which we hope provides the basis for a democratic society. Rather than giving aid directly to Hussein, the United Nations attempted to set up an “oil for food” program by which oil revenues were traded for food provided directly to the Iraqi people.⁸

Existing research suggests that although modernization may lead to democratization, it is likely a condition that is neither necessary nor sufficient. Selectorate theory suggests that we should seriously consider the incentives of political leaders to provide public goods and create free democratic systems. Other prominent works, such as that of Daron Acemoglu and James Robinson (2006), *Economic Origins of Dictatorship and Democracy*, suggest that the success of democracy depends on elites' not having incentives to oppose it. This research indicates that in developing foreign policies intended to promote democratization, we should not limit ourselves to promoting economic development and broader education among the population but should explicitly consider the motivations driving political leaders.

Future Directions

There are many remaining questions about the connection between political development and modernization. There are three areas at the forefront of research about the link between politics and economics—understanding the shared foundations of development and freedom, expanding our knowledge about the wide variety of nondemocratic systems, and better understanding the preferences of groups in reaction to socioeconomic changes.

First, scholars have recently suggested that there are shared foundations for both economic growth and democracy. For instance, James Robinson (2006) suggests that there are underlying causes—such as secure property rights and the rule of law—that explain why countries are economically successful and more democratic. The result is that we observe that democracies are typically wealthy, not because wealth causes democratization, but because the same factors make both more likely. In a similar vein, Amartya Sen (1999) advances the idea of shared underlying causes of democracy and economic growth by making the case that development should be conceptualized as removing “unfreedoms” from society. In writing that “development is freedom’s possibilities,” he expresses the idea that individual freedom is both the end and the means of development (p. 298). Only by ensuring a social commitment to the protection of individual freedom can societies progress. This is a radically different and integrated conception of political and economic development, one that is largely responsible for Sen’s Nobel Prize in economics.

A second area of future research examines the tremendous variation among nondemocratic systems. This chapter has focused on the determinants of democracy without considering the many different types of nondemocracies. However, research has suggested that nondemocracies vary in politically significant ways. For instance, Juan Linz and Alfred Stepan (1996) trace differences in the

democratic transitions of nondemocratic governments, which they classify as *authoritarian*, *totalitarian*, *posttotalitarian*, and *sultanistic*. However, many questions remain, including why military dictatorships arise in some countries but rigged-election systems emerge in others.

Selectorate theory offers a starting point for understanding the differences among nondemocratic systems. Bueno de Mesquita et al. (2003) note that some nondemocracies are more successful than others at achieving economic development and providing citizens with public goods such as roads and schools. The reason is that the loyalty of a leader’s winning coalition—the people on whom the leader relies for power—varies markedly in different nondemocratic systems. For instance, in dictatorships with rigged elections, it would be difficult for the small group of supporters (who help the leader cheat in the election) to defect and bring another ruler to power because there are many people available who can help rig an election. The result is that the leader does not need to spend a lot to buy the support of the winning coalition because it provides a very loyal base. Because the leader does not need to spend a lot to maintain support, he does not need to be overly concerned with producing national wealth through economic development. In contrast, in a military dictatorship in which the winning coalition (a handful of military officials) can successfully and relatively easily transfer their support to another dictator, the leader needs a lot of resources to continue to buy support. As a result, the leader in a military dictatorship has more incentive to promote economic development in order to obtain the wealth necessary to pay off a more fickle group of supporters. This research provides a starting point for understanding variation among nondemocratic systems, but much work remains to be done on the origins of the many different types of nondemocratic systems and other ways in which their political systems vary.

A final area of future research is inquiry into how groups such as private businesses and citizens react to socioeconomic changes. Groups should not simply be lumped together as a whole in studying the connection between politics and economics. A notable reason is evident in research on the welfare state. Businesses are often thought to oppose national welfare programs, whereas citizens are assumed to support them. However, Isabela Mares (2003) notes that businesses have not always opposed the introduction of welfare state programs, as is often assumed, but that their preferences depend on the kind of business. Business support for national welfare programs hinged on whether businesses would have control over the national system and whether they perceived benefits in the reduction of risk (due to illness and old age in the workforce) that could be beneficially distributed across all businesses.

Likewise, there is evidence that citizens are not always opposed to retrenchments in the welfare state. In *Democracy and the Market*, Przeworski (1991) frames the

dilemma of market-oriented reforms in Latin American and post-Communist countries of Eastern Europe as being one of forward-looking politicians attempting to overcome the opposition of citizens hesitant to accept the uncertain costs of transitions. However, evidence suggests that there are instances in which citizens can be convinced of the benefits of market-oriented reforms.⁹ Such research suggests an interesting direction for a better understanding of the ways economic actors play a role in political developments.

Advancing our understanding of the connection between political development and modernization requires us to be more nuanced in our understanding of what constitutes development, the different types of nondemocratic systems, and the diversity of group responses to economic changes.

Conclusion

This chapter has reviewed the major developments in research on political development and modernization. Global problems persist in highlighting the importance of studying why and how economic and political systems should be designed. According to Freedom House, as of 2008, a little more than half of all people in the world (about 3.6 billion) lived in political systems that are not free. Although the World Bank notes some progress on poverty alleviation—from 1981 to 2005, rates of extreme poverty have declined from more than half to about a quarter of the global population—this means that about 1.7 billion people continue to live without their basic material needs being met.¹⁰ Addressing why these problems arise and persist is of paramount concern in achieving freedom from hunger and repression—two basic, yet still elusive goals, for most of the world's population.

3. Francis Fukuyama. (2006). Foreword. In S. Huntington, *Political Order in Changing Societies* (p. xiii). New Haven, CT: Yale University Press.

4. Jorge I. Domínguez (2001) explains the different interpretations of Huntington's work, including the ways in which he challenged modernization theory while simultaneously using an approach relying on factors highlighted by modernization theory. See Domínguez, J. I. (2001). Samuel Huntington and the Latin American state. In M. A. Centeno & F. López Alvez (Eds.), *The Other Mirror: Grand Theory Through the Lens of Latin America* (pp. 219–239). Princeton, NJ: Princeton University Press.

5. Valenzuela and Valenzuela (1978) compare the assumptions, methods, and conclusions reached by modernization and dependency theory in the context of Latin America. Writing in 1978, they concluded that modernization theory is more parsimonious but makes arbitrary distinctions about which phenomena are traditional, thereby explaining a lack of development. In their view, dependency theory drew on a broader set of evidence but needed to be more precise in laying out its concepts and causal explanations.

6. In explaining proper research design, Barbara Geddes offers a very useful summary of the rise and fall of dependency theory and an explanation of why the theory lasted for so long despite compelling cross national evidence. See pp. 6–17 in Geddes, B. (2003). *Paradigms and Sand Castles: Theory Building and Research Design in Comparative Politics*. Ann Arbor: University of Michigan Press.

STATISM

ANNA BATTÀ

University of North Texas

Prior to World War II, scholarship in comparative politics focused mainly on the study of institutions in western European countries, and formal theories examined the workings of the state in detail. At that time, the state was viewed as an autonomous entity with a large degree of power on its own. Society and its impact on the state seemed somewhat unimportant. The behavioral revolution of the 1960s and 1970s, on the other hand, altered the focus of political inquiry completely. With the rise of the *society centeredness* approach, individual and group behavior assumed primacy of analysis, and political scientists retreated to a large extent from the study of the state. Indeed, scholarship of this time portrayed the state as a black box without having its own interests and being merely an arena where behavioral games of various groups and individuals were acted out. Possibly the biggest contribution of recent statist theories is the idea of “bringing the state back in” (as Skocpol, 1985, expressed it) to the attention of scientific inquiry. Theda Skocpol’s works (1979, 1985) began this movement, which was later extended by emphasizing the state’s security function (Ayoob, 1992; Tilly, 1985) and diversity of structure in the various forms of autocracies, such as corporatist (Malloy, 1977), bureaucratic (O’Donnell, 1978), neopatrimonial (Bratton & van de Walle, 1994), and totalitarian regimes (Bova, 1991; Bunce, 1999). A focus on weak states (Migdal, 1988) and the politician’s dilemma in developing countries (Geddes, 1994) completed the general scholarship

on providing a balanced view between individual and group behavior, as well as the workings of the state.

In general, statist theories define what is understood by the institution of the state and analyze the relationship between state and society. In addition, authors within this subset of literature provide explanation about the formation and development of states. Despite its frequent usage, the concept of the state has been ambiguous in the social sciences and has been defined arbitrarily in the past (Sabine, 1934, cited in Almond, 1988). Perhaps because of its strong-fisted or authoritarian connotation, as in “*l’état c’est moi*” by Louis XIV, and the emergence of the norm of state sovereignty after the Treaty of Westphalia, political scientists have preferred to call the state anything but that (Watkins, 1968). As a result of far-reaching political mobilization in the West during the 19th and 20th centuries, the term *state* was replaced by *government* and later on by *political system* (Almond, 1988). State sovereignty and the emergence of new political institutions, such as political parties, pressure groups, and the mass media, facilitated a change that called for a broader term for referring to the general entity of the state.

The notion of the state, however, remained important in the Marxist and neo-Marxist interpretation of politics. Scholars working within this paradigm view the state as the “coercive instrument of the ruling class,” defined in terms of the ownership and control of the means of production (Miliband, 1969, p. 5). Essentially, under the

capitalist system, the members of the ruling class control the political system and determine the state's policies and actions (Miliband, 1969). Because of the above dynamics, political equality, save in formal terms, is impossible in the conditions of advanced capitalism, Marxists argue. Therefore, the state as a powerful entity plays an important role in supporting the capitalist class and in perpetuating the status quo.

Eric Nordlinger (1981) aims at avoiding anthropomorphizing the state and settles for a definition that stresses the policy-making function of individuals rather than institutional arrangements. Based on his understanding, the definition of the state must focus on individuals because it is only individuals who are able to create public policy.

State Organization and Domination

One of the earliest contributors of statist theories, Max Weber, in a speech given at Munich University in 1918, lays out what became known as the definition of the modern state. According to Weber, the state "cannot be defined in terms of its ends; . . . ultimately, one can define the modern state sociologically only in terms of the specific means peculiar to it, as to every political association, namely, the use of physical force" (Gerth & Mills, 1946, p. 77). Prior to the establishment of the modern state, the use of physical violence by actors other than the state was considered normal because territories in Europe changed hands frequently. However, with the rise of the modern state, the use of physical force was gradually restricted to the state. In other words, the state assumed "the monopoly of the legitimate use of physical force within [its] territory" (Gerth & Mills, 1946, p. 78).

State domination, however, rests on additional factors, such as traditional, charismatic, and legal aspects of legitimation, Weber argues. Rules and historically recognized habits that became part of national consciousness are believed to have special power that can in itself bring about compliance by the populace. This argument is not unlike Montesquieu's (1989) in *The Spirit of the Laws*, in which he states that obedience to a power is sustained not necessarily because of a rule's existence but because of a long-standing history and adherence to that particular rule. Further, citizens of a country may also follow the leader's decision if he or she is gifted with extraordinary charisma or prophetic ability. Finally, popular domination may also take place via the legal system and rationally established rules. Perpetuating either form of this domination is a function of controlling the material goods the state is equipped with and acquiring additional material from tax revenues collected by the state. Organized domination requires administrative staff, which is bound to the power holder by either material reward or social honor or both (Gerth & Mills, 1946).

In agreement with Weber, subsequent scholars of statist theory argue that the most important function for which the

state organizes is its security function (Ayoob, 1992; Tilly, 1985). With the famous phrase "War makes the state," Charles Tilly (1990) argues that states come about for the main reason of defending themselves from other states. Based on this understanding, the government's main function is to monopolize violence, which inherently functions on economies of scale. In other words, within a particular country, the state is the sole possessor of violence for the primary reason of coercion, and since this function encompasses the entire territory, monopolized violence is carried out on a large scale. According to statist theories, the state is engaged in legitimate organized crime for the protection of individual citizens, who have no choice but to accept this public good (Tilly, 1985).

According to Tilly (1985), agents of states have four types of activities in terms of organized violence, which are war making, state making, protection, and extraction. This assessment is an extension of Lane's (1958) analysis of protection. The purpose of *war making* is to eliminate or to neutralize the state's "own rivals outside the territories in which they [i.e., the state] have clear and continuous priority as wielders of force" (Tilly, 1985, p. 181), whereas *state making* is aimed at "eliminating or neutralizing their rivals inside those territories" (p. 181). The *protection* activity intends to eliminate or neutralize the enemies of the state's clients; and finally, *extraction* capability refers to "acquiring the means of carrying out the first three activities—war making, state making, and protection" (p. 181).

Bringing the State Back In

During much of the behavioral revolution in the social sciences, analysis mainly focused on individual and group behavior, and the society-centeredness approach dominated major discourses. This approach denied the autonomy of the state and viewed the state as a place in which various actors seek to dominate politics. Beginning with Skocpol, however, the perception of the state began to change. According to Skocpol, the state is very much an autonomous unit, and it has interests of its own as an organic entity (Skocpol, 1979, 1985). Specifically, the state has the ability to generate situations in which revolutions can occur, and rebels are able to exploit such situations. Skocpol questions the core idea of the society-centeredness approach, as well as the Marxist view that the state's function is nothing else but serving the interest of the dominant economic class. According to Skocpol, the state is autonomous from the dominant economic class, with interests of its own that are different from the dominant class (Mason, 2004). Essentially, the state's function is not merely serving the interests of the ruling capitalist class.

Authors besides Skocpol moved away from the society-centered viewpoint (Eckstein, 1960; Evans, Rueschemeyer, & Skocpol, 1985; Krasner, 1984; Truman, 1951).

Stephen Krasner (1984) argues that if the state and public institutions are merely seen as referees of politics, this would negate the idea that the state is able to manipulate and change its own society. The major function of public officials is perhaps more than only making sure that the game is played fairly; the state is therefore an autonomous actor in the political system. Further, given that executives, congresspeople, and judges each have authority and discretion in their decision making, governmental institutions do have autonomous decision-making capacity (Truman, cited in Almond, 1988).

Yet other scholars suggest that the state has even more autonomy than previously stated. In addition, they argue that the pluralist paradigm is not one-sided; a two-way relationship exists between the state and society (Almond, 1988; Eckstein, 1960). According to Gabriel Almond, both the society-centeredness viewpoint and the bringing-the-state-back-in group are missing the point. Within a pluralist system and widespread representation, society has the ability to exert a large degree of influence on the state, but the state also has the ability to influence society. Austin Ranney (1966), for example, gives the example of the president who is the chief legislator and implies that this function is rarely a passive one. Further, the political executive must deal with a variety of interest groups and has to be able to resist the pressures stemming from them (Carter & Hertz, 1972). Finally, bureaucrats are responsible for the majority of policy initiatives and take part in the design of policies, as well as influencing the agenda of decisions (Putnam, 1973).

Nordlinger (1981; Nordlinger, Lowi, & Fabbrini, 1988) seems to provide somewhat of a moderate middle ground between the two views, although his stance is not entirely clear. He states that the ability of public officials to translate their own preferences into public policy is fairly limited if those preferences deviate largely from the preferences of society. Almond perhaps has gone too far by attributing too much autonomy to state officials, he argues. Officials' ability to turn nominal power into decisional power is severely restricted. Nordlinger dismisses the idea that the state is an all too powerful, autonomous entity able to assert its own policy preferences. Instead, he argues that the state is a malleable unit that is indeed "in the hand of the most powerful individuals" (Nordlinger, 1981, p. 21). Only when preferences of state and society converge will the state follow the preferences asserted by society. However, there is a two-way relationship between these two actors, and in agreement with Almond, Nordlinger states that the society-centered models ignore this two-way relationship.

David Easton (1981) states that the return to the state movement arises out of a contemporary revival of Marxism. Yet those working within this movement differentiate themselves from Marxists because they clearly articulate that the state is more than merely subservient to the ruling capitalist class (Skocpol, 1979, 1985). Based on the Marxist conception of the state, owners and controllers

determine policies, and the state is never an autonomous entity and does not have the ability to act against the interest of the dominant capitalist class. Neo-Marxists, on the other hand, argue that the state is relatively autonomous and temporarily acts against the interests of the dominant class to maintain capitalism, which is the long-term interest of the dominant class. In essence, the state may act against the short-term interests of the ruling class in order to save capitalism.

State Building and Structure

In addition to defining what is included in the idea of the state and clarifying the relationship between state and society, statist theories assess the difficulties state formation entails in both industrialized countries and developing nations. The formation of the state in the West was characterized by a long, gradual, but also violent process during which the frequent exchange of territories eventually came to a halt and borders solidified. With the signature of the Treaty of Westphalia, the international system accepted an entirely new arrangement, based on which the building blocks of the system were nation-states equipped with full sovereignty and the promise of noninterference by other equally sovereign states. What exactly is meant by *nation state*, however, has not been clear since. On one hand, *statehood* refers to the political side of a country, including especially the institutional aspect of governance, whereas a *nation* is defined as encompassing a relatively uniform culture and ethnicity, as well as identity within a country, in addition to the political aspect. Furthermore, based on Article 3 of the Montevideo Convention, which restated already existing international law, a country is considered a nation-state if it has (a) a permanent population, (b) a defined territory, (c) a functioning government that has control within the borders of the country, and (d) a capacity to enter into relations with other states. Even though many countries, such as many weak states in Africa, for a certain period in their histories clearly do not meet some of these criteria, these standards have been typically the baseline of evaluation for nation-state status.

In an increasingly interconnected world in which global trade and economic activity are widespread and in which increased transgovernmental organizational activity prevails, it is important to evaluate how recognition of individual states by the international community factors into the definition and assessment of nation-state status. At present, an internationally accepted treaty that would achieve this aim does not exist. The above-mentioned Montevideo Convention does not incorporate this element and resorts instead to the "declarative theory of statehood," omitting the recognition specification (Hillier, 1998). Some nations subscribe to the "constitutive theory of statehood" (Lauterpacht, 1958), which does intend to add international recognition; however, this theory has been criticized on the

grounds that it is incomplete and does not deal with instances in which states are not recognized by others.

Despite the above difficulties with respect to clarifying the state as the unit of the international system, developing countries were required to build nation-states based on preexisting conditions that barely resembled those of the Western state-building process. Mohammed Ayoob points out important differences between third world countries and established Western democracies in terms of state structure and organization during state formation. Third world countries not only are weak states, which means that they have a much more difficult time penetrating society, but they also face civil wars within their borders with a much higher frequency than industrialized nations had to during the time of their state formation (Ayoob, 1992; Migdal, 1988). Resource extraction is also problematic for newly emerging states because of widespread poverty, and institution building is often stalled by high levels of corruption and strong ethnic differences.

State building is shaped and determined in the context of the international environment. Statist theories point out that third world countries are faced with the task of establishing a nation-state because it is the only acceptable unit of political interaction on the broader world stage. The international system is set up with the state as a building block, and whether some countries' communal identities or organizational structures match the system or not, they have to follow the prescribed scheme nevertheless. It is argued that nationalist identity in countries following colonization was frequently forged, and the sense of community did not follow already existing ethnic lines (Ayoob, 1992).

Again, the development of the nation-state in Europe differed drastically from the formation of the state in other areas of the world, especially the third world. State development in Europe took centuries and was accompanied by bloody civil wars and ethnic as well as religious disagreements. Perhaps it is too much to expect third world countries on the path of nationhood not only provide security during the transition period but also offer adequate welfare and enable participation at all levels of government, each of these elements being a difficult task on its own. European countries at the time of their state formation faced merely the provision of security. Developing countries, on the other hand, are expected to achieve a much higher level of development at a considerably faster pace and at the same time fulfill the many demands that a globalized, modern, and complex world places on them.

Types of Authoritarian States

Another contribution of statist theories is that, in addition to the standard dichotomy of democratic versus authoritarian regimes, they differentiate among various subtypes of authoritarian states and assess the problems

associated with such arrangements, as well as recommending policy for dealing with those problems. Five major types of authoritarian state systems can be distinguished: corporatist, bureaucratic-authoritarian, neopatrimonial or sultanistic, totalitarian, and posttotalitarian (Linz, 2000). The prospects of democracy differ according to which state system operates in any given country.

The *corporatist* state is typically a one-party-dominant system in which only a limited number of component units or sectors exist, such as labor unions, peasants, merchants, and industry, and no competition takes place among specific units (Malloy, 1977). Essentially, the state ultimately decides which units will be allowed to participate in the system, and the state strictly controls leadership selection of the individual units. Membership in a corporatist setting is compulsory, and if a person, by occupation, is a member of a certain category, he or she is automatically a member of the organized corporate group. Organization outside of the boundaries of corporate groups is not possible. In addition, the structure of individual compartment units, such as labor, industry, peasants, merchants, and so forth, is hierarchical, and only the leadership has direct interaction with the agents of the state.

Furthermore, the corporatist system is characterized by a strong element of bureaucratic planning, and although elections do take place, it is clear which party will be the winner of those elections. Examples of corporatist authoritarian states include Mexico under the Institutional Revolutionary Party (PRI) and the South Asian Tigers, such as Singapore, South Korea, Taiwan, and Hong Kong. Corporatism in these states functions as a way of accommodating and accepting the process of modernization and development. Stresses that naturally come from modernization are believed to be relieved if the state manages society adequately. Conflict is not inevitable; however, if the state is able to possess the authority and the skills to manage the process of modernization, conflict can be minimized. Democracy has the highest probability of springing up in the corporatist system, given that individual compartment units are already organized and can serve as the basis of civil society and democracy if they are able to cast off their ties to the dominant party (Malloy, 1977).

Within corporatist settings, the state typically provides benefits, such as steady jobs, to those who are part of the various sectors. In case the state fails to sustain the provision of such benefits, the system evolves into a *bureaucratic authoritarian* system, in which elections are suspended entirely (O'Donnell, 1978). Bureaucratic-authoritarian regimes evolve when groups that had been previously actively involved in policy making are deactivated, which is often achieved via military coup. Transition to democracy from a highly technocratic state, such as the bureaucratic system, can take place after the old corporatist order is restored.

In a *neopatrimonial* state, the right to rule is prescribed to a person and not to an office, and benefits are given in

exchange for political loyalty (Bratton & van de Walle, 1994). Political office in such a system is determined by loyalty and is not based on merit. In addition, bureaucratic power is either weak or nonexistent. Neopatrimonial states typically do not display the formal governing coalitions between state and social interests or the collective bargaining over core policy issues that are found in corporatist states. In neopatrimonial states, the chief executive maintains authority through personal patronage rather than ideology or law.

Observable differences exist between the corporatist and the neopatrimonial system. Under neopatrimonialism, for instance, the state has undermined capitalist forms of accumulation, whereas in a corporatist state, capitalism is allowed to function. In other words, under corporatism, the state respects individual property rights and observes the rules of the capitalist economy, but in the neopatrimonial state, private ownership of assets is not the norm, and state ownership of such assets prevails.

Both corporatist and neopatrimonial regimes are built on personalistic ties and typically experience high levels of corruption. The *patron–client* relationship is pointed out by John Duncan Powell (1970), who argues that environmental scarcity and the constant threat of drought or other natural disasters make peasants vulnerable economically, and therefore, to secure protection, peasants turn to the patron on a regular basis. There is a degree of power asymmetry between the superior (patron) and the subordinate (client). The relationship between these two actors depends on reciprocity in the exchange of goods and services. On one hand, the patron provides security for those engaged in subsistence farming, and the client reciprocates with political support for the patron. Patron–client relations are strong and typically enduring in traditional villages, where face-to-face contacts prevail. In a more integrated village, the relationship is characterized by differentiation and specialization. This type of contact is highly personalistic, largely with informal agreements. Essentially, a public entity that would function as an enforcement authority does not exist. There are no sanctions of compliance, and transactions take place within the realm of private accountability. This form of association differs largely from the relationship between citizen and representative, in which public accountability and the rule of law prevail. Peasant unions under the patron–client system either do not form or are organized from above, such as in the corporatist state (Scott, 1972).

The final two subsets of authoritarian systems are *totalitarian* and *posttotalitarian* regimes. Totalitarian systems are characterized by state ownership and control of all production assets and the complete absence of market forces (Bova, 1991; Bunce, 1999). These types of systems employ centralized planning, and one party dominates the political agenda. The regime has eliminated all preexisting political, social, and economic pluralism and has a unified, articulated, and guiding utopian ideology.

Leadership in a totalitarian setting functions with a high degree of uncertainty.

Posttotalitarian regimes are similar to totalitarian systems, with the major difference that the central ideology fades over time. Under posttotalitarianism, the state still has one party and one party only; however, some constraints on the leader are established gradually, and there is a more noticeable degree of social pluralism. Leaders of such regimes rule less by charisma and more on the basis of technical competence. Bureaucratic and technocratic leadership is more the norm than highly ideological and charismatic control. In some cases, elements of democratic opposition can be present in civil society and could lead to democracy. These elements, however, are not allowed in a totalitarian state. Furthermore, the black-market economy is tolerated as an alternative to the inefficiencies of a state-managed economy. It is possible for a partial market economy and a planned state economy to coexist within a posttotalitarian state (Linz & Stepan, 1996).

Transition from a totalitarian regime to a posttotalitarian state is visible once the overarching ideology declines and state legitimacy wanes as a result. Increasingly a growing disjunction is present between the official ideology and reality (Linz & Stepan, 1996). Citizens and elites are less committed to state ideology, and growing criticism of the regime comes from society. Although there is a clear decline in ideology, the leadership still observes a coherent set of ideas, unlike in other authoritarian regimes. Transition to democracy from posttotalitarianism is complicated by the lack of a preexisting civil society and the absence of political parties and democratic leadership. Obtaining a democratic political culture in this case is a difficult task.

The Politicians' Dilemma and Weak States Syndrome

Early statist theories focused on the institutions of the state whereas works written during the behavioral revolution purposely played up the role of the grassroots level. Very often the literature leaves out a balanced description of the relationship between state and society. This balance, however, is better accomplished in scholarship dealing with the third world, such as scholarship exploring the dilemma politicians face when trying to deal with the limitations of a patron who stands as a filter between state and society (Geddes, 1994) and the weak states syndrome (Migdal, 1988).

As mentioned above with respect to neopatrimonial regimes, patron–client relations, which are often the basis of politics in the third world, benefit both sides, the patron who receives the vote of the client and the client who takes advantage of the benefits provided by the patron. Furthermore, the benefits the client receives from the patron are known, certain, and immediate. Moreover, the patron, or *political entrepreneur*, as Barbara Geddes

(1994) terms it, has similar certainty that this form of exchange will enable the patron to stay in office. However, the dilemma politicians face concerns long-term reform of the economy, politics, or the broader society. As long as the reforms proposed coincide with the activities that need to be done for the politician to remain in office, reform will be delivered and will take place. But if the immediate effect of maintaining office collides with long-term reform prospects, reform will remain unrealized for years to come. Most of the time, the *politician's dilemma* inhibits the growth of state capacity and reform because politicians choose the immediate effects over long-term reform even if reform would improve their long-term credentials.

Previous scholarship treated the state as a unitary actor, behaving almost as an individual (Skocpol, 1979, 1985). Geddes (1994), however, shows that the state is composed of many different segments, such as parties, legislature, or the parliament, in each of which officials are seeking to fulfill their own rational self-interests. This self-interest includes reelection for the next term, or "maximizing their career success" (Geddes, 1994, p. 7). This dynamic heavily influences the ways in which the overall political system works. Further, administrative reform is a collective good from which everyone is likely to benefit, but organizing the reform would be irrational for individuals, and therefore the collective action problem arises as a result. The collective action problem occurs when individuals have little incentive to participate in the production of public goods; however, once the public good is provided, they will enjoy the benefit of it.

According to Robert Axelrod (1984), cooperation is possible to achieve if groups are small enough to detect *free riders*, individuals who prefer to enjoy the benefits of public goods but do not participate in the production of them. From small-scale cooperation, large-scale cooperation evolves over time because cooperation spreads to other groups as well. Geddes (1994) disagrees with this claim and states that smaller groups actually hinder the emergence of wider cooperation because of the patron–client relationship inherent in some societies. In other words, solving the collective action problem in small groups will not lead to the spread of cooperation to the larger society. In patron–client arrangements, cooperation is irrational because clients receive goods for their votes and noncooperation benefits them personally and directly.

Geddes (1994) proposes ways to deal with the politician's dilemma and potentially increase state capacity. First, civil servants should be insulated from political influence and need to be cut off from direct political involvement. Second, positions for administrative personnel have to be built on a heavily merit-based system that asks for the specialized skills the job requires. Finally, Geddes states that new agencies have to be created that are autonomous from the government, such as the Federal Reserve Bank or the Federal Aviation Administration.

The origins of *weak states* can be traced back to the global economy, as well as the colonial heritage many of these states experienced. The industrial revolution in Europe led to the development of entire regions' producing raw materials for the insatiable European market. Furthermore, the commercialization of agriculture affected more than 90% of the overall world population. Previous communal holdings were abolished, and land tenure laws were altered substantially. As a result, many people lost their land, and the old social control declined markedly. Another factor that is believed to have led to developing countries' becoming weak states is those countries' history of colonialism (Clapman, 1985; Young, 1995). Colonies were economically and culturally peripheral to the mother country. Previous local political systems were displaced by colonial administrative systems, which still form the basis of nation building today.

Despite established political institutions, former colonies remain weak states after decolonization (Migdal, 1988). Although constitutions have been developed in most of these states, those documents mostly remain papers with little enforcement power. Overall, the state remains weak and is unable to penetrate society, regulate social relations, or extract resources that would enable the state to function properly. One of the main reasons for the staying power of weak states is the persistence of patron–client relations (Powell, 1970; Scott, 1972). Peasants for the most part remain under this relationship because the patron provides insurance in case of natural disasters and poverty. The bond that ties the peasant to the patron is perhaps too strong to be destroyed.

Weak states are unable to dominate over rules of other social institutions, such as families, clans, tribes, patron–client dyads, and even multinational corporations (Migdal, 1988). Multiple sets of rules exist within society and often form gridlock with one another. Part of the reason the patron–client scenario persists is that people feel the state would be unable to provide security in case of economic hardship. People feel that this is a task a patron is better equipped and willing to deal with. On the other hand, there is also widespread resistance coming from the side of the strongmen, such as chiefs, landlords, and bosses.

Joel Migdal (1988) describes a few strategies that weak states employ for political survival, given the nature of present relations, in which the state has difficulty penetrating society. In a phenomenon termed the *big shuffle*, state leaders periodically appoint, remove, and shuffle heads of agencies and institutions that have the potential to accumulate political power, or in other words, that would have the ability to threaten the current regime. Also, in order to secure and to keep the position of the present leadership, people are appointed to key positions who have deep personal loyalties to the leader in forms of kinship, clan or tribe ties, and so forth. Further, leaders of weak states frequently resort to the imprisonment and

torture of the opposition. Each of these strategies hinders weak states from developing more complex institutions that could help them democratize. Increasing the complexity of state structure is believed to be one way to counter fast-paced development and modernization (Huntington, 1965). By artificially preventing the development of institutions, weak states close themselves off from future development.

Conclusion

Statist theories define what is understood by the state. However, this definition has been fairly ambiguous and has expanded to include political parties, pressure groups, the mass media, and so forth. As a result, frequently the term *state* has been replaced by other phrases, such as *government* or *political system*. Scholarship of statism also looks at state formation within the Western context, as well as that of developing countries. Further, statist theories also describe various functions for which the state organizes. These functions include the monopoly of warfare within set state boundaries (Tilly, 1985; Weber, cited in Gerth & Mills, 1946), taxation, the provision of social services, and so forth. Views of the state and its role in society have changed over time. Initial Western formal theories have looked at the state from the institutional standpoint. Subsequently, the society-centeredness approach, which viewed the behavior of society and interest groups as more crucial than the workings of the state, dominated. With Skocpol's works, however, the state was brought back to the fore of social inquiry. Finally, statist theories also recognize the nuances among authoritarian states and reach deeper into understanding this subset of systems. Works on the politician's dilemma (Geddes, 1994) and weak states (Migdal, 1988) have begun to provide a more balanced view of the interaction or the two-way relationship between state and society.

DEPENDENCY AND DEVELOPMENT

FRANK A. BOYD JR.

Illinois Wesleyan University

What explains the divergent development trajectories of different countries and societies? Why has the developing world failed to close the gap with the industrialized countries? This chapter reviews the literature by scholars in the Marxist tradition that addresses these and other questions of development, beginning with the writings of Karl Marx, continuing through the work of Vladimir Lenin, and ending with the more recent work of the dependency theorists. This literature is vast. And like the writings of Marx himself, there are often competing or even opposing theoretical arguments from scholars considered part of this tradition. Taken together, this literature forms an enduring theoretical counterpoint to the liberal economic theory that has informed generations of policymakers from both developed and developing countries.

Marxist, neo-Marxist, and dependency explanations of development differ from traditional liberal economics in the importance of noneconomic factors for explaining development. Liberal economists emphasize that countries can best promote development by limiting social and political concerns from policy making and by integrating their national economies into the global market. In response, the literature featured in this chapter suggests that development can be explained only through an understanding of the social and political underpinnings of policy making and that self-interested countries should view economic interdependence as inherently asymmetrical. Neo-Marxist

and dependency theorists argue that capitalism distributes the benefits or profits from economic production in an uneven fashion, so specific groups or classes of individuals benefit more than others in a domestic economy. This logic is extended to the international system, where the structure of global markets ensures that wealth becomes concentrated in a small group of countries at the expense of a larger group of developing countries.

This chapter now turns to Marx and the theoretical beginnings of this approach, followed by a brief overview of Lenin's theoretical revision and extension that served as a benchmark for the neo-Marxists of the early 20th century. The last half of the chapter attempts to impose some order on the sprawling literature referred to as *dependency theory*. These scholars borrowed, often selectively, from orthodox Marxism to explain the development fortunes of the developing world and the relationship of these countries to their industrialized counterparts in the North.

Marx and Lenin

Karl Marx (1818/1977) and the scholars who followed him characterize capitalist economies as inherently conflictual and exploitative. In his critique, Marx described how the dynamics of capitalism provide a powerful force for producing and accumulating wealth. Adam Smith (1776/1994), David Ricardo (1817), and the liberal economists that followed

them explained that capitalist markets are self-regulating. But over the long term, Marxists argue, capitalist markets do not have a natural, self-regulating equilibrium. Instead, capitalist systems are subject to cycles that will impose great costs on societies and will increase in severity as capitalism matures. Workers, rather than producers, will bear the economic and social costs of these market fluctuations. Marx argued that workers ultimately would reject capitalism in favor of socialism by way of a popular revolution. Of course, a worldwide socialist revolution has not materialized, but scholars working in the Marxist tradition have preserved the central assumptions of Marx to explain political and economic development in the least developed countries (LDCs), and some continue to call for a Marxist revolution.

Marx's writing was wide-ranging, and his scholarship has spurred significant, and often divergent, scholarship. His explanation of capitalist development focused on the productive process in which economic activity produced surplus value, or profits, that accrued to the bourgeoisie, or owners of capital, instead of to workers. Marx explained that the creation of surplus value is necessary for capital accumulation, which is an important determinant of mid- to long-term economic development. Because workers, by definition, are excluded from ownership, they also are excluded from reaping the true benefits of their labor.

Marx employed a specific analytical approach, which he described as a materialist conception of history, or *historical materialism*. From this perspective, societies progress over time through different modes of production determined by the tools, natural resources, technology, and other productive resources available to them. Marxist scholars disagree on the number of specific modes, but the modes begin with tribal societies, continue through feudalism, and end at the highest level of development, the capitalist mode of production. At each mode, or stage, societies organize themselves differently and develop specific and economically contingent ways of dividing the surplus of their productive activity. This process yields a specific social and political superstructure that rests on the mode of production and is specific to a society's stage of economic development. Feudal societies, for instance, had social and political institutions dramatically different from those of the societies in the newly industrializing countries of western Europe in the late 19th century. Marx's analysis of early industrial Europe focused on the transition from a feudal political economy to a capitalist system. The most important implication of Marx's insight is that political relations are contingent on and will respond to changes in productive activity. It is on this nexus—the recursive relationship between economic and political development—that neo-Marxist and dependency theorists focus their scholarship.

Robert Gilpin (1987) notes that Marx's critique also identified three internal contradictions of capitalist economic systems that would cause tensions between the economic and political development trajectories of countries.

The first is the *law of disproportionality*. Liberal economics assumes that markets tend naturally toward equilibrium, with the supply of goods produced either rising or falling to meet demand. The prices of goods will also fluctuate in response to market signals, ensuring that capitalist economic systems will rarely suffer from severe disequilibrium. Instead of equilibrium, Marx proposed the law of disproportionality, which stated that the productive efficiency of capitalism will instead trigger increasingly severe economic fluctuations, leaving markets with an oversupply of goods or workers (consumers) who lack the resources to buy them. When the social and political fallout from disproportionality combines with the other negative consequences of capitalism, social upheaval and political revolution will result.

The second law emphasized by Marx is the *law of capital accumulation*. Capitalist markets provide opportunities for producers to efficiently reap profits and to accumulate the surplus value, or wealth, of economic activity. Over time, the internal dynamics of capitalism tend to concentrate wealth in the hands of a few, which in turn can affect the productive and consumptive capacity of domestic economic systems. This concentration of wealth becomes problematic if the capital is not invested in ways that generate additional economic activity. For example, producers may choose not to invest their capital but to transfer the profits overseas or use their capital for consumption. Thus, capitalist systems can be denied investment that is required for continued economic growth. Marx argued that the concentration of capital would ultimately breed social and political unrest among workers that could destabilize countries or even trigger a popular revolution.

The third and final law of capitalism emphasized by Marx is the *long term decrease in profits* realized by producers. The discipline of competitive markets encourages producers to protect their profit margins by increasing the efficiency of their operations, by reducing labor costs, by incorporating technology, or by other means of depressing wages. Workers, faced with higher rates of unemployment or reduced purchasing power, drive down the price of goods and further depress the profits of producers. Again, Marx predicts that political and social costs of this dynamic unrest will eventually trigger popular protest to confront the costs of capitalism.

Marx's early work provided a sophisticated critique of capitalism, but he found that his theoretical framework did not fit very well when he turned his attention to the countries of Asia, where the feudal and precapitalist characteristics that he observed in Europe did not exist. Moreover, what is called the Asiatic mode of production did not have the class conflicts that Marx observed in western Europe, which left Asian countries without the dialectical class conflict that can propel a country's development trajectory.

Nearly 40 years passed between Marx's work and the first publishing of Lenin's (1939) major work, *Imperialism*,

which undertook the task of refining Marxism to explain the rapid diffusion, expansion, and persistence of capitalism. There was much to explain. Capitalism had expanded and flourished between 1870 and 1917 and had suffered none of the systemic problems proposed by Marx. *Imperialism* provided a description of how capitalist countries avoided the political upheaval predicted by Marx through imperial expansion of their economic and political power. In short, Lenin extended Marx's critique of capitalism from domestic political economy to the global sphere.

In the late 19th and early 20th centuries, the European economic powers acquired vast colonial holdings in Asia, Africa, and Latin America. These colonies helped extend the reach of capitalism by providing sources of raw materials, markets to absorb the overproduction of manufactured goods, and capital investment opportunities for European firms. The financial capital that was made available by industrialization allowed the European powers to exploit the workers and extract the natural resources of their far-flung colonies. In a theme that would be the focus of the dependency theorists some years later, Lenin explained that the imperial powers used their economic might to co-opt the political and economic elites native to the colonies.

Moreover, the development of an imperial system allowed industrialized countries to secure new markets for their manufactured goods. As firms became more efficient, the supply of goods soon exceeded the domestic demand for their goods. Lenin explained how imperialist expansion allowed the industrialized countries to export their manufactured goods to the captive markets of their colonies, thereby muting some of the negative aspects of capitalism that had been emphasized by Marx.

For Lenin, the imperialism that he observed in the early 20th century represented a more advanced form of capitalism but was nevertheless a system that in the long term would suffer from systemic instability. Imperial capitalism generated rapid but uneven development, a theme cited by Marx in his domestic analysis of capitalism. Once the imperial powers had expanded capitalism to include the entire developing world, Lenin predicted that the negative consequences of capitalism would trigger conflict among the imperial powers. Moreover, the economies of the developing world—propelled by the forces of capitalism—would eventually expand to compete with the imperial powers. These economic conflicts among and between capitalist countries would eventually result in political competition, armed conflict, and the eventual demise of the capitalist system.

Dependency Theory

Dependency theorists returned to the themes of Marx in the mid- to late 20th century, and they presented a collection of approaches to the political economy of developing countries. Mainstream economic thought of the

time clustered around *modernization theory*, whose foremost proponent, W. W. Rostow (1960), suggested an explanation of economic development that borrowed the Marxian notion of stages of growth. These scholars saw the development of all countries proceeding along a similar trajectory and believed that differing levels of development simply reflected the position of countries along this set developmental path. This perspective argued that the economic and political factors that had been important for explaining the rapid development of the countries in the North—resource endowments, labor inputs, technology, and investment capital—could similarly drive the development of LDCs. In fact, the most rapid path to economic development was rapid integration into the global political economy.

But dependency theorists argued that the characteristics of LDCs and their position in the global political economy strongly conditioned their prospects for growth. In fact, the relative poverty of the developing world could not be explained as a function of their relative isolation from the global political economy, but instead could be explained by the manner in which they were integrated into the global capitalist system. To explain the shortcomings of Rostow's approach, dependency theorists drew on the whole panoply of Marxist and neo-Marxist thought, while adding some theoretical refinements that better explained the pattern of development they observed in the 1960s and 1970s. For instance, early Marxists concentrated primarily on the relations of production, whereas the dependency theorists placed more emphasis on the structure of unequal exchange.

The dependency literature can be divided into two essential approaches. The first group posits the “development of underdevelopment” and was advanced by Paul Baran in the 1950s and Andre Gunder Frank in the mid-1960s. These early dependency scholars focused principally on the international dimension of dependent development. Baran, Frank, and others certainly incorporated domestic political, social, and economic factors into their analysis, but they devoted little analytical space to explaining domestic actors and institutions. This group of scholars also agrees on the need for a worldwide Marxist revolution to overthrow the capitalist system.

A second theoretical cluster eschews the revolutionary political dimension of the early dependency theorists and Immanuel Wallerstein. The scholars of this group reject the necessity of a socialist revolution and instead suggest that LDCs can harness the economic power of capitalism to promote development in the periphery (defined below). This literature also devotes analytical space to domestic politics and elaborates a finely grained explanation of the relationship between domestic political factors and the international political economy. Overall, these scholars attribute more agency to domestic political actors on the periphery and argue that in some cases, the processes of dependency and development can coexist in LDCs.

The “Development of Underdevelopment”

Scholars often cite Baran (1967) as the first of the neo-Marxist scholars of the dependency school. Baran’s work incorporated many of Marx’s basic assumptions about political economy and refined them to better explain the development of LDCs in the mid-20th century. He began with the basic observation that the capitalist system rests on an exploitative relationship between the industrialized countries of the “center” and the developing countries of the “periphery.” For Baran, the functioning of a capitalist economy requires exchange relations that produce more rapid economic growth in one group of countries at the expense of development in the second group of countries. Thus, the functional relationship between development and underdevelopment is a requisite characteristic of capitalism, and the prospect of rapid economic growth in the LDCs actually threatens the profitable functioning of capitalism and the economic fortunes of industrialized countries.

This center–periphery structure of the international political economy takes Marx’s class-based theory of development and extends it to the international system. An international division of labor segregates the countries of the periphery into a functional role in which they produce primary commodities to be used in the manufacturing industries of the center. In the early 20th century, Lenin emphasized the imperialistic exploitation of colonies by the colonial powers. Baran’s (1967) work sharpened this theoretical insight and observed that the political economy of LDCs had changed very little since Lenin’s time, with agriculture and mining remaining the dominant economic activity.

Baran’s (1967) most significant theoretical contribution is a revision of Marx’s theory of surplus value. Baran suggests that the problems of underdevelopment can all be traced to the underutilization of economic surplus. Baran proposed a three-part typology of surplus: actual surplus, potential surplus, and planned surplus. *Actual surplus* refers to the difference between production and consumption; *potential surplus* indicates what societies could produce and what they need to consume; *planned surplus* indicates a society’s planned production and optimal consumption. Baran conceded that measuring both potential and planned surplus would be difficult in practice, especially given the difficulty in establishing an indicator of a country’s actual surplus. Still, these theoretical concepts emphasized the structural position of LDCs in the world political economy and how the dominance of monopoly firms in developing countries weakened the bargaining positions of LDC governments. Taken together, these structures make it difficult, if not impossible, for LDCs to accumulate the capital that is necessary for long-term development.

If the profits that are earned in LDCs are not reinvested there, where do they go? Rather than investing their profits in higher-value-added manufacturing, Baran

explains, the elites in LDCs tend to replicate the consumption patterns of their counterparts in the industrialized center. The purchase of imported luxury goods and consumer durables contributes little, if anything, to LDC economies. In addition, these same elites often take surplus capital and deposit it in overseas banks for protection against market fluctuations or political unrest in their home country. Hence, developing countries are never able to provide the capital accumulation that is necessary for economic development.

Frank (1967) extended many of Baran’s observations about the underdevelopment of LDCs, beginning with the assertion that the industrialized center realizes more relative gains in its economic relationships with the developing countries of the periphery. Instead, in Frank’s view, development and underdevelopment are two interrelated parts of the international capitalist system, which is divided into the *metropole* of developed countries in the center and the LDCs of the periphery. The capitalist system binds together the economic and political fortunes of the core and periphery in an exploitative system of exchange. The very design of the capitalist system produces economic surplus that is drawn out of the periphery to enrich the metropole countries. To describe this dynamic, Frank coined the pithy phrase “the development of underdevelopment.” He even argued that this exploitative system replicated itself within developing countries, where industrialization can be found in the urban centers at the expense of the rural poor, who remain subjugated to the political and economic dominance of the urban elite.

Frank’s (1967) work differs from classical and neo-Marxists in one significant respect: He rejected Marx’s historical modes of production. Instead, Frank contends that the economic systems of LDCs have long been capitalist in structure and that countries do not pass through a sequence of production modes that ultimately ends in capitalism. Empirically his analysis concentrates on Latin America, whose countries have been integrated into the global capitalist system since their political independence in the early to mid-19th century. Frank observes that there exist few observable differences in the economic structures of Latin American countries between the time of Hernando Cortés and the present. Frank argues that these countries did not struggle to leave behind a feudal economy, polity, and society but instead were inserted into the capitalist economy. From this perspective, countries are not underdeveloped because they have yet to pass through the successive stages of economic development to reach capitalism; rather their underdevelopment is a necessary by-product of the development of the center.

Modern World-Systems Theory

A final theoretical refinement and extension of Baran’s and Frank’s work can be found in modern world-systems (MWS)

theory, of which Wallerstein (1974) is the foremost proponent. MWS scholars built on the work of early *dependen-tistas* (dependency theorists), and they also rejected some of the core assumptions of Marx. For instance, where Baran, Frank, and other early dependency theorists paid scant attention to the domestic political economy, the MWS theorists formally asserted that the analytical focus should be on the international system, whereas Marxism concentrates on the domestic class struggles over production and the surplus value that comes from it, and Wallerstein posits an international system of states divided into center, semi-periphery, and periphery.

This class-based system places an economically dominant group of countries at the core and a much larger group of underdeveloped countries on the periphery, all of which together constitute a functional whole. Of course, Marxist scholars since Lenin have posited a center-periphery capitalist structure, but Wallerstein added a third category of states, the *semi periphery*, to the traditional dualism of Marxist and neo-Marxist theorists. The political systems of the semi-periphery allowed them to marginally resist the political power of the core and to capture some of the economic surplus that would otherwise be transferred out of their country. The addition of the semi-periphery also made Wallerstein's world capitalist system more closely reflect the economic and political development of countries in the mid-20th century, when a number of countries, such as Brazil, Korea, and Taiwan, had significant manufacturing sectors that competed with industries in the center.

MWS theorists argue that the same dynamic capitalist forces that drive economic development in the core countries also produce underdevelopment in the countries of the periphery. In an extension of Frank's "development of underdevelopment," this argument holds that capitalism will not produce development in the countries of the periphery over the long term. Instead, economic development of the core necessitates a concomitant underdevelopment at the periphery. Rather than being loosely joined, the countries of the core and the periphery are mechanistically linked so that the economic surplus of the dependent periphery is transferred to the core. Wallerstein makes this argument in its most pure form by stating that a country can have no national development that is independent of the larger system within which it resides. Wallerstein and Frank diverge from classical Marxist thought by refuting Marx's historical modes of production. They counter with the claim that the countries of the periphery will never experience the capitalist development of the center but are fixed in a permanent state of underdevelopment.

Dependency Theory Without Revolutionary Marxism

The origins of *structuralism* actually predate the early dependency theorists, whose roots are in the 1950s, but

structuralism came to the fore in 1964 with the publication of the report titled *Towards a New Trade Policy for Development*. This report and the work of the U.N. Economic Commission for Latin America became identified with structuralism and the work of Raúl Prebisch (1950). Structuralists differ from the early dependency theorists in their rejection of the Marxist and neo-Marxist call for a revolutionary overthrow of capitalism. In fact, structuralism has little of the Marxist ideological approach found in much of the other dependency literature.

Nevertheless, structuralism shares many theoretical assumptions with the other dependency theorists, beginning with an understanding that global capitalism establishes unequal terms of trade between the center and periphery. Many of the same factors that expanded international trade in the 19th century allowed late developers such as Germany and Japan to combine to perpetuate or even widen the developmental gap between industrialized and developing countries. For example, capitalism requires ongoing technological innovation to reach higher levels of productivity and to generate ever increasing profits. Structuralists join other dependency theorists in arguing that technological innovation does not always spur economic growth and development, especially for the commodity-producing countries of the periphery.

Because they are "late, late developers," LDCs remain the principal producers of primary commodities, whereas high-value-added industrial production is found in the center.

In industrialized countries, the competitive forces of capitalism compel producers to introduce technological innovations to increase the value of manufactured goods by lowering production costs and increasing their efficiency. Workers become displaced in this process, and in industrialized countries, investment flows are sufficient to provide other employment opportunities for these workers. Thus, the competitive destruction of capitalism provides for higher levels of efficiency while still providing higher-wage employment for workers.

The structural characteristics of LDCs, however, mean that the benefits of technological investment are less apparent and potentially costly for several reasons. First, technological innovation is almost always imported from the core and directed at agricultural production or very light, low-value-added manufacturing. Second, most dependency theorists explain that the amount of capital investment available for developing countries is much lower than in the industrialized core. This stems, in part, from the generally low savings rates in poorer countries. As Baran argued, the profits that might be used for domestic investment are either repatriated to the core or consumed by the local elites, whose consumption patterns more closely mirror those of the industrialized core than those of their fellow citizens in the periphery. To be sure, technological innovation and capital investment in agriculture can increase efficiency, but there is a limit to the innovation

possible in the production of primary commodities. Even if they still have jobs, workers are left with depressed wages, and displaced workers face a labor market with few alternative employment opportunities.

Beyond the considerable overlap with other dependency theorists, structuralists offer an important theoretical contribution regarding the declining terms of trade faced by countries on the periphery. Structuralists argue that there is a long-term decline in the terms of trade for developing countries, which depend on primary exports, in relation to the industrialized core, whose manufacturing sector generates products with ever increasing value. Over time, the profits for primary commodities do not increase at the same rate as do the profits for higher-value-added goods. This inequity between export revenue and the price of exports creates imbalances in a country's balance of payments.

The evidence for a long-term decline in the terms of trade is mixed, with many developing countries reporting periods of decline in their terms of trade, interspersed with periods of rapid improvement. This pattern points to another important contention of structuralists regarding the fluctuations of commodity markets. The instability of commodity markets makes for much sharper and unpredictable business cycles in developing countries. This is especially true for countries that depend on a small basket of primary exports, because a sharp drop in the profits for one commodity can have very serious economic implications. Moreover, the demand for primary exports is externally determined and contingent on the appetite for those commodities in the industrialized North. Because they are unable to predict or anticipate these market fluctuations, countries are unable to craft long-term planning for development. Again, the structure of the international market has a differential impact on the core and the periphery.

Of all the scholarly work reviewed in this chapter, structuralism has had the most direct impact on policy making in LDCs. In response to plummeting commodity prices and unavailability of manufactured goods, a number of LDCs have attempted *import substitution industrialization*. Countries on the periphery erected tariff and nontariff barriers to protect infant industries that focused on producing goods for domestic consumption. In the short term, some countries rapidly developed manufacturing sectors, but many of these sectors collapsed in the longer term. The domestic markets of LDCs, even in larger countries such as Brazil, proved to be too small to support a profitable manufacturing sector. Also, the same protection that kept multinational corporations out of the markets of larger LDCs also removed any incentives for domestic firms to improve quality or efficiency of production. For this reason, Brazil, Argentina, and Mexico eventually supported bloated, inefficient industries that faced no significant competition from international firms. Few countries pursued import-substitution industrialization as a development strategy after the 1980s.

Dependent Development

Fernando Cardoso and Enzo Faletto first published their work, *Dependency and Development in Latin America*, in 1967, but an English translation did not appear until 1979. Although they are grouped with the dependency theorists, many of their theoretical assumptions are at odds with the other scholars in the school. Cardoso and Faletto (1979) observed that the predictions that flowed from Baran, Frank, and other early dependency theorists did not correspond with the development experiences of many developing countries. A number of countries on the periphery had large and growing industrial sectors. By the late 1960s, the countries of the Southern Cone in Latin America had burgeoning industrial sectors, and several countries of East and Southeast Asia boasted an expanded manufacturing sector.

The economic growth and development in these countries—then referred to as the *newly industrializing countries*—called into question the determinism of the early dependency theorists. Why, they asked, did industrialization proceed in some developing countries and not in others? Cardoso and Faletto place great emphasis on the domestic political dimension of dependency. Specifically, they argue that LDCs can effectively intervene on behalf of national capital and that international capital can be encouraged to invest in domestic economies for manufacturing and for nonexport production. Nevertheless, Cardoso and Faletto note that the bargains struck by elites in developing countries often do not result in a broad distribution of wealth among the broader population of developing countries. The maldistribution of wealth creates both economic and political challenges for LDC governments and also creates a tendency to adopt nondemocratic or even what Guillermo O'Donnell (O'Donnell, Schmitter, & Whitehead, 1986) calls *soft authoritarian* forms of governance.

Peter Evans (1979) followed Cardoso and Faletto in defining a more autonomous role for the state in developing countries, and in explaining in more detail the domestic political dimension of development. According to the early dependency theorists, the actors and institutions of peripheral states had very little agency in determining the prospects for economic development and simply responded to the structural characteristics of global capitalism. The early dependency theorists either ignored or reified the preferences of these different actors, and they did little to explain how or why bargains emerged among them. Evans argued instead that states in some instances play a central role in organizing the alliances between domestic political and economic actors and the international capitalists who would invest in their countries. Evans also provided much more insight into the relationship between the state, international capital, and the local elite and explained how this “triple alliance” could promote economic development and capital accumulation in developing countries.

Evans's empirical analysis centered on the development experiences of Brazil, where the industrial sector grew considerably during the first half of the 20th century, but only with the consistent pressure of the local elite and the state. His study explains that the state played a key role in securing an agreement between local and international capital but also found it very difficult to strike a bargain that would provide for a broader distribution of the profits. Evans also explains that the experience of Brazil could very well be extended to the other countries of Wallerstein's semi-periphery.

Conclusion

The critique of capitalism set forth by Marx explains how the powerful forces unleashed by global capitalism would transform societies from feudalism to capitalism. He observed how the forces of capitalism spread from Great Britain to Europe and believed that ultimately capitalism would revolutionize the productive modes of the entire world. The internal contradictions of capitalism, however, would create a conflict between workers and the owners of the means of production. The conflict between these two classes, which Marx described as a dialectical struggle, would eventually yield to socialism. Most important, however, is the claim that capitalism would eventually diffuse to every country in the global economic system.

Lenin built on the theoretical insights of Marx, viewing the expansion of capitalist markets and production as essential for moving countries from their historic modes of production, such as feudalism, for instance, to worldwide socialism and ultimately Communism. In many ways, Lenin's argument stood opposite many dependency theorists. Lenin believed that capitalism would promote the development of the periphery rather than retard its chances for long-term economic growth. Conflict would arise when the imperial countries were challenged by their newly developed colonies. Thus, Marx and Lenin theorized that global capitalism promoted the development of LDCs, although that development might proceed in an uneven fashion.

Dependency theorists, although departing from Marxist orthodoxy in some respects, draw on the Marxist tradition to explain economic and political development. Nearly every summary of dependency theory emphasizes the heterogeneity of this work, which makes the grouping of its literature somewhat difficult. This chapter posits two groups. The first group, referred to as the *early dependency theorists*, emphasizes the need for or inevitability of a socialist revolution, and the second group concentrates on the possibility of dependent development.

Even though the dependency literature covers significant and at times contradictory theoretical space, nearly

all dependency theorists share a few common assumptions: The prospects for development in LDCs are externally determined or strongly conditioned by factors external to the developing countries; the countries of the center benefit from unequal exchange with the periphery; and even in the absence of national development of LDCs, the local elite often benefits from the investments from industrialized countries. Baran suggests that the capitalist development of countries in the industrialized center formed a functional economic link with the LDCs of the periphery. Frank extends this argument by arguing that global capitalism fueled the development of underdevelopment of the periphery. This concept, it is worth noting, contradicts the predictions of Marx and especially Lenin. Wallerstein provides an extreme example of how these early dependency theorists paid scant attention to the domestic political economy of development in LDCs.

As noted earlier in this chapter, the later dependency theorists perceive a less deterministic relationship between developed and less developed countries. Cardoso and Faletto also see the development prospects of LDCs as strongly conditioned by global capitalism, and they attempt to explain the uneven pattern of development among developing countries. Evans extends this perspective in his explanation of Brazil's industrialization by suggesting a triple alliance of multinational corporations, the state, and local capital (or bourgeoisie). Rather than presenting a deterministic model, Evans suggests that development policies emerge from bargaining, and in the case of Brazil, a path of dependent development emerged. In contrast to the earlier literature, these scholars devote more space to analyzing the structure and function of domestic actors in LDCs.

There remains a significant gap between the level and trajectory of development among LDCs and that of the industrialized center. But the notion of the developing world as a single, relatively homogeneous group of countries is no longer accurate or analytically useful. As a result, scholars in the 21st century are less likely to employ the analytical approach set forth by the dependency theorists. It is interesting that scholars and especially journalists are more likely to invoke some of Marx's perspectives to explain the increased frequency of global financial crises. To be sure, the conditioning effects of global capitalist markets will continue to be of interest to scholars interested in explaining the variations in development among groups or classes of countries.

CIVIL WARS

M. ISRAEL STEPHENS

University of North Texas

Since the end of World War II, there have been 5 times as many civil wars as interstate wars and at least 5 times as many deaths due to civil wars as due to interstate wars (Singer & Small, 1994). For various reasons, the relative peace among the members of the state system did not seem to elicit a similar effect within the members of the state system during the six decades after World War II. It is perhaps not surprising then that scholarly literature on civil wars has grown substantially—and substantively—in the 21st century. Scholars ostensibly accept that civil wars are social phenomena distinct from interstate wars, which implies that civil wars likely have causes, correlates, and outcomes that are substantively different from the causes, correlates, and outcomes of interstate wars.

This chapter discusses the major theoretical contributions and controversies related to the civil war research program. First, civil wars are defined conceptually, then operationally. Second, major theories focusing on the causes of civil wars are discussed, along with future directions and policy implications. The chapter ends with a summary and a brief note on the current state of civil war research. While the discussions herein are by no means exhaustive, they tend to focus on the most notable civil war theories at this time.

What Is Civil War?

Civil war is defined in two ways: conceptually and operationally. The latter definition is subordinate to the former in that the latter attempts to make the former definition empirically useful. As will become clear, the disagreements among scholars about operational definitions can be traced to divergent opinions about what civil wars are conceptually. It is thus necessary to commence with the conceptualization of civil war prior to discussing alternative operational definitions.

Civil Wars Versus Interstate Wars

The first step is to elucidate what makes a war a *civil* war. Simply, civil wars are those fought between or among disputants within a single country, in contrast to wars fought between or among disputants of different countries. But to characterize civil wars as different from interstate wars in this manner is to miss the truly consequential differences between the two types of wars. A twofold trend of civil wars not found in interstate wars makes civil war a conceptually different type of war.

First, civil wars are fought between disputants of relatively unequal political stature. States ostensibly have the

sole legitimate authority to use coercive power within the country. All other subgroups are therefore politically inferior to the state, which renders the state inimical to subgroups' autonomy and the subgroups' autonomy inimical to the primacy of the state. That is, when subgroups desire more autonomy—such as when the Kurds attempt to dissociate themselves from the Turkish state—the subgroups begin to pose an existential threat to the state's primacy in that territory. Likewise, increased state vigilance manifestly threatens the ability of subgroups to govern themselves. For instance, China's actions in Tibet in 2008 transferred much of Tibet's local authority to the state apparatus in Beijing. In both cases, the state is politically superior to the outgroup. This contrasts with interstate wars, which involve disputants who are—theoretically—political equals. That is, no one state is legally subordinate to another. Canada has no legal right to make Lesotho's laws, nor does Lesotho have any right to impose laws on China. Were these states ever to war with each other, there would be no rebel group.

This distinction in the relative political (in)equality of the disputants in civil and interstate wars arises because of the structural contexts within which the two types of wars occur. As mentioned, an established civil hierarchy exists whereby states can force compliance legitimately. It is this hierarchy that rebels seek to deconstruct or reconstruct and which the states wish to preserve or augment. Conversely, the international system is void of a formal, constitutional order (Waltz, 1959). It is therefore argued that interstate wars likely occur as a result of disagreements or ambiguities about what states' obligations are to one another, given that they are political equals and are not inherently subordinated to one another (Waltz, 1959).¹ The second critical distinction between civil and interstate wars, then, is that civil wars occur in a context of order whereas interstate wars occur in a context of anarchy.

Although counterintuitive, that civil wars occur where there is order does not correlate with less chaos. Indeed, some posit that civil wars tend toward more chaos than do interstate wars precisely because order preexisted (e.g., Vazquez, 1993). In this view, chaos erupts because disruption of the extant order leads to a disruption of the sociopolitical paradigm by which all citizens and groups of citizens interact. On the other hand, there is no sociopolitical paradigm to be corrupted on the international stage; the only type of war affecting the macro sociopolitical paradigm of the international system would be world wars (Vazquez, 1993).

Empirical data tend to validate the idea that civil wars have a relatively more violent disposition. Mason (2004) estimates that civil wars produced 170,000 battle deaths per year in the first five decades after World War II. These deaths, according to Singer and Small's (1994) *Correlates of War Project*, accounted for 64 out of every 100 battle deaths suffered (Mason, 2004). The 1997 update of *Correlates of War* shows the same trend, with more battle deaths attributed to civil wars than to interstate wars

(Sarkees, 2000). Even these data obscure the differences in brutality. For example, scholars observe that civil war casualties tend to include a relatively high percentage of noncombatants (Holsti, 1996) as states and rebels target civilians for a variety of reasons (Kalyvas, 2006; Mason, 2004; Mason & Krane, 1989). Moreover, if it is true that civilians become targeted only after they are convincingly labeled "barbarians" (Salter, 2002), then wars in which political unequals engage in combat ostensibly would be the wars most likely to produce civilian casualties. That is, the task of labeling the enemy a barbarian within the civil war context appears much simpler than the task a state would have in labeling another state barbarous. And if such labeling is a virtually necessary condition of civilian casualties, then it follows that civilian casualties are more likely to occur in civil wars than in interstate wars. The point is this: Not only do civil wars substantively differ from interstate wars, but logic and evidence suggest that these differences explain why civil wars tend to take on a decidedly more violent disposition, including the tendency to produce substantial civilian casualties.

Civil Wars Versus Other Types of Internal Political Violence

On distinguishing civil wars from interstate wars, the task remains to discriminate civil wars from other forms of domestic mass behavior and political violence. One characteristic is that civil wars involve collective action (Lichbach, 1998; Mason, 2004). For collective action to occur, individuals face a paradox they must resolve in order to commit to group goals (Lichbach, 1998; Olson, 1971), in this case rebellion. Briefly, the benefits of a successful rebellion are public goods. When a good is categorized as a public good, it means (a) that the good is not able to be excluded from public consumption—that is, the good cannot be privately held—and (b) that the enjoyment of the good by one consumer does not diminish the quality or quantity of the good for another individual. The implication is that an individual who had not aided in the rebellion would still be able to partake of the benefits of a successful rebellion. And given that the costs of a failed rebellion likely would be heavy for participants, both possible outcomes incentivize choosing to stay home instead of joining the group. The emergent paradox is that if everyone were to join, success would be virtually guaranteed, but since the potential costs of joining are so high, few do so at first (Lichbach, 1998). Civil wars occur only when a critical mass of individuals overcomes the incentives to stay home.

To be certain, similar paradoxes arise for other types of collective action, including protesting and rioting. What separates the collective action in civil wars from these other types is that civil wars simultaneously involve collective action (rebellion), political motivations (deposition or preservation of sociopolitical order), and reciprocation (fighting between the rebels and the state). That is, in civil wars, political motivations undergird collective action,

which manifests in violent rebellion to which states violently respond. Civil wars combine collective action with violence that is both political and reciprocal. Each concept is discussed in turn below.

Violence in civil wars is inherently political, which is to say, for instance, that rebels' objectives are based on subverting and changing societies' legal structures. Criminals, by contrast, tend to be less ambitious. Criminal behavior can be described as circumvention of society's legal structures.

The dichotomy between the political and the criminal is critical to defining civil wars conceptually because it permits researchers to scientifically distinguish between the behaviors of the Tamil Tigers and Al Capone's Chicagoland gangsters, for example. The former wanted to live by a sociopolitical order wholly autonomous and distinct from the sociopolitical order imposed by the Sri Lankan central government. Conversely, Al Capone and his ilk sought only to live outside the sociopolitical order and had little desire, if any, to displace or significantly alter the prevailing sociopolitical order.² In a sense, then, antistate behavior wrought by political motivation—as in the Tamils' case—is intentional and systematic. Antistate behavior wrought by criminal motivation is coincidental—a strategy used to navigate around state strictures that occasionally pose inconveniences.

To classify civil wars as inherently political is hardly to isolate them from other phenomena. Indeed, politicide and coups d'état are but a couple of examples of alternative types of political violence. In neither of these types, though, is the violence mutual. In the case of politicide, the state targets civilians who do not and—perhaps—cannot fight back. The converse case applies to coups d'état; essentially, the state is powerless to fight back and subsequently cedes its authority to the usurpers. For the political violence to be associated with civil war, however, there must be *dueling* (explained below) and organized violence between the disputants (Fearon & Laitin, 2003; Sambanis, 2004). For this reason, routs, massacres, or any other type of one-sided violence conceptually differs from civil wars; each can, however, be a precursor to civil war (Kalyvas, 2006; Mason, 2004).

While it is generally accepted that mutual violence between disputants is a necessary condition for a civil war to exist, there is debate about whether the state must be a disputant. The phenomenon of *failed states* in particular has brought this issue to the fore. The modern sociopolitical arrangement requires a state to impose social contracts and to provide its citizens with basic protections from internal and external threats (Migdal, 1988). *Weak states* have limited capacities to do so and often co-opt existing social networks in order to accomplish the most basic operations (Migdal, 1988). In failed states, not only are the most basic state operations neglected, but no coherent apparatus exists from which the state can operate, nor is there a general consensus among the populace of what or, more important, of who the state is (Buzan, 1983). Classic

examples include, among others, Democratic Republic of the Congo, Afghanistan, and Somalia ("The Failed States Index," 2005; Patrick, 2007). The problem for civil war studies is whether the type of fighting typically observed within the territories associated with failed states constitutes civil war, a subtype of civil war, or a separate type of conflict altogether. At issue is the absence of the state as a disputant in the fighting taking place in these countries.

In one of the most important and influential books on conflict, Small and Singer (1982) include among their civil war criteria the requirement that the state must be a disputant in the internal fighting. Yet Sambanis (2004) observes that this principle is not uniformly applied. In Somalia, for instance, a state does not exist in any institutional coherence. There is, consequently, no state involvement in the brutal fighting ongoing within the territory. Still, scholars tend to classify the conflict as a civil war (Sambanis, 2004; see, e.g., Fearon & Laitin, 2003; Sarkees, 2000). To reconcile this incongruence, some degree of nuance has been added.

Foremost, the idea of the state as a disputant has been reinterpreted to include claimants to the state (see Fearon & Laitin, 2003; Sambanis, 2004). A claimant is any sub-state group that asserts its right to fill the void left by, or never occupied by, the state. The fighting in territories of failed states often occurs among multiple, competing claimants (Holsti, 1995). Under this context, such conflicts ostensibly pit disputants against one another for the right to impose their preferred sociopolitical order. As noted above, violent conflict over sociopolitical order within a territory is what makes wars *civil* wars. For this reason, conflicts in Sierra Leone, Afghanistan, and Somalia, for example, tend to be classified as civil wars.³ The state as a disputant is therefore not a necessary requirement for civil war; rather, the disputants must simply be competing over the right to act as the state.

This makes sense considering that this is essentially what states are doing when they instigate or reciprocate violence against coherent substate groups. States fight for the right to impose their sociopolitical order in the given territory, which is exactly what substate groups do in the absence of a coherent state. Consider a few examples.

Secessionist conflicts occur when ethnic enclaves attempt to dissolve their political ties to an existing nation-state in favor of forming their own. Competing claims about who ought to impose whose sociopolitical order therefore evolve from the ethnic enclave and from the extant state. The Chechens' fight to separate Chechnya politically from Russia is an illustrative example of this type of conflict. The Chechens believe they ought to be able to impose their preferred sociopolitical order within Chechnya, but Russia claims the right to project its preferred sociopolitical order from Moscow.

Some intrastate conflicts are believed to emerge because one socioeconomic group perceives itself to be disadvantaged or exploited by another socioeconomic group, which usually controls the state. The fighting that

emerges is a result of the outgroup's desire to depose the existing sociopolitical order, for which the ingroup stands, in favor of a new or significantly altered sociopolitical order. The social revolution in China that took place throughout the 1930s and 1940s represents this type of conflict, as do other rebellions, especially other social revolutions. In that conflict, the Communist Party of China won support from peasants, arguing that the system as run by the Kuomintang exploited the peasants and left them altogether politically powerless. The only way to garner power was to depose the Kuomintang's sociopolitical order and replace it with the Communist Party of China's preferred sociopolitical order. The Kuomintang fought to preserve its right to occupy the state apparatus from which it could impose its preferred sociopolitical order.

Finally, conflicts in territories of failed states, as mentioned above, often involve competing claimants to the state. That is, the substate groups battle for the right to impose their preferred sociopolitical order throughout the territory. Mobutu Sese Seko's departure in 1997 sent Zaire into conflict illustrative of that often found in failed states. Mobutu's departure left a void in central authority. Within a year, violent conflict emerged as Laurent Kabila's Alliance of Democratic Forces for the Liberation of Congo-Zaire, commonly known by the initials AFDL, which changed the name of the country to *Democratic Republic of the Congo*, and Jean-Pierre Bemba's Movement for the Liberation of Congo issued competing claims to the state. Each, in the absence of a coherent state, sought the right to impose his preferred sociopolitical order throughout the Congo.

Although these three examples are by no means exhaustive of the types of intrastate conflict observed, the examples do cover many of the contexts from which intrastate conflict emerges. And despite the differences in the makeup of the disputants in each case, one fundamental aspect of each conflict is striking in its recurrence: The genesis of conflict arises from competing claims to the right to impose the territory's sociopolitical order. The implication is that conceptually, civil wars can be defined without setting firm criteria about the makeup of the disputants. What is more important is the goal of the disputants.

Based on the analysis above, civil wars have been isolated conceptually from other social phenomena. First, civil wars take place within an internationally sovereign territory. Second, civil wars involve collective violence that is reciprocated; one-sided waves of terror do not qualify. Third, the ultimate goal of the disputants is to win or maintain the right to impose their preferred sociopolitical order on the populace residing within a given territory. A working conceptual definition of *civil war* is warranted:

Civil wars are mutually violent conflicts between or among organized disputants who live within the borders of a sovereign member of the international system and who have issued simultaneous, competing claims to the right to impose the sociopolitical order over all, or a segment of, the territory within the system member.

To define civil wars this way jibes with most of the contemporary conceptualizations of civil war by emphasizing the origin and intent of the disputants. Separatist conflicts, social revolutions, rebellions, and conflicts between substate groups trying to fill the void left by the state all fit within this definition. Unfortunately, this definition has flaws, too, which will become evident in the next section.

Measuring Civil Wars

In order to use civil wars as an empirical concept, not only must researchers isolate civil wars conceptually; scholars also must find ways to populate cases from which data can be collected. And for all the progress the literature has made in isolating civil wars conceptually, problems still persist in the operationalization of civil war. For example, the conflict between the Colombian government and the Marxist Revolutionary Armed Forces of Colombia (FARC) fits most of the elements of the civil war definition given in the previous section. Recent developments, though, have led FARC rebels to begin to base their operations out of neighboring Ecuador. The retreat of rebels to neighboring states (Sahleyn, 2007) is but one part of a trend in which civil wars have begun to take on international dimensions (Gleditsch, 2007). Indeed, some fighting between the Colombian government and FARC rebels has taken place in Ecuador. The problem this poses for the present conceptualization is that the FARC rebels no longer live within the recognized borders of the state they seek to depose, nor is all the fighting contained within Colombia, yet the conflict is a widely cited case of domestic insurgency, which suggests the above definition ought to be altered some. But to relax the definition would be to begin to blur the conceptual lines between civil and interstate wars again. This case thus illustrates that endemic problems persist, which makes producing a standard set of civil wars difficult and explains why myriad sets exist. It is therefore perhaps unsurprising that each set tends to favor the idiosyncrasies of its author's research goals (Sambanis, 2004).

Death Totals as Metrics for Civil Wars

Recognizing that problems exist, however, does not imply that the literature is void of any standard approaches to operationalizing civil wars. First, a typical practice is to employ death totals to identify important civil war properties. Total aggregate deaths tend to indicate whether violence up to the level of a war has taken place, and relative death totals among the disputants have been used to indicate whether the violence was one-sided or mutual enough to be considered *dueling* violence (e.g., Fearon & Laitin, 2003; Gleditsch, Strand, Eriksson, Sollenberg, & Wallensteen, 2002; Sambanis, 2004; Sarkees, 2000; Singer & Small, 1994). The proximity of deaths in time also is used to determine the beginning of and, in some cases, the end of civil

wars (see Sambanis, 2004). The differences among the studies include the threshold of deaths necessary and the time over which the deaths must take place. For instance, Gleditsch et al. (2002) use a lower per annum restriction than do Fearon and Laitin (2003) or Sambanis (2004).

The crux of the debate over the utility of deaths as a metric for civil war properties is whether limited skirmishes and overall low levels of violence are sufficiently high to classify as civil wars. If the death threshold is too low, then researchers might include cases in which no *real* threat to the state or extant sociopolitical order exists. Conversely, setting the threshold too high would bias studies toward bloodier conflicts, which may or may not be more divisive than the excluded, less bloody conflicts. The high death total might have something to do with advanced technology, population density, or some other exogenous factor not inherent to the conflict itself. Indeed, Sambanis (2004) discusses the attributes of employing relative measures in order to ensure that the death total substantially affects the nation-state under consideration. For instance, 1,000 deaths in China represent 0.001% of the population, whereas 1,000 deaths would account for about 0.03% of the Uruguayan population and 0.2% of the Montenegro populace. Put another way, deaths in China are worth about 5% of each death in Uruguay and worth about 0.33% of each death in Montenegro. There are also cultural, philosophical, and ideological differences across time and space that place different values on life in general (Finnemore, 2003). For instance, it was just over 200 years ago when the United States constitutionally agreed that people of a certain suppressed and enslaved minority were equivalent to only three fifths of a person from the majority ethnic group. In essence, a literal application of this provision would require nearly 1,700 deaths from the suppressed minority to equate to 1,000 deaths of the majority. For these reasons, deaths are not as straightforward a measure as scholars would like.

The arbitrariness of death thresholds is also an issue. Take Fearon and Laitin's (2003) 1,000-death threshold, for example. Seemingly, there is little substantively different in a civil war from the time of the first death until the time of the 1,000th death. Yet the first death does not become a civil war death until the 1,000th death is reached. Despite these frailties, it is difficult to discern what might be a better, more consistent indicator of political violence than deaths, hence the widespread use of deaths as a metric.

Levels of Analysis

In addition to the issues associated with measuring key properties of civil wars, there is also a debate about what the appropriate level of analysis is for civil war research. The debate prompts researchers to consider whether their measures authentically operationalize their conceptualization of civil wars. Failure to do so could result in an ecological fallacy whereby researchers use one level of analysis to operationalize theories about civil war conceptualized on another level of analysis.

Currently, there are two major camps. One branch of the literature is devoted to resolving macrolevel puzzles about the causes and effects of civil wars (e.g., Collier & Hoeffler, 2004; Fearon & Laitin, 2003; Horowitz, 1985). In effect, the primary question these studies ask is, why do some states experience civil war while others, similarly situated, do not? A second branch of the literature focuses on microlevel puzzles, questioning why some individuals join rebellions when others do not, and what prompts individuals to engage in violence (e.g., Gurr, 1968; Kalyvas, 2003). Some works do a good job of synthesizing the two approaches, showing how macrolevel conditions can affect individuals' choices and, ultimately, their behaviors at the microlevel (e.g., Kalyvas, 2006; Mason, 2004; Mason & Krane, 1989).

The key is that studies must not blur the levels of analysis. Theories about the root causes of civil conflict are no more capable of explaining why individuals commit to mass violence than theories about the desire to punish for past injustices can explain why some states are more prone to civil wars than others. The following examples should make this point clearer. In the former case, consider Horowitz's (1985) seminal work on ethnic conflict. A root cause of civil wars, Horowitz argues, is the need ethnic groups have to compare favorably with each other. When one group compares unfavorably with another, the situation fosters enmity and, eventually, conflict between the groups (Horowitz, 1985). And while this certainly seems to be the case, the theory does not explain the motivation an individual has to commit to violence. That is, not all marginalized individuals join their coethnics to fight, and, moreover, many who do fight do so for reasons that differ from the stated political reasons (Kalyvas, 2003).

Of course, in the latter case, whether individuals are motivated to violence by a sense of justice and retribution or by cold calculation and personal ambition does not explain why some states tend to be more prone to political turmoil than others are. Consider Gurr's (1968) enduring work on relative depravity. Essentially, Gurr (1968) argues that a necessary condition for mass political violence is anger in individuals. The anger evolves from situations when what one thinks one can achieve falls short of what one believes one rightfully should have the opportunity to achieve (Gurr, 1968). That this article is cited frequently four decades after it was written is testimony to its explanatory power. It does, however, fall short of explaining why some states seem more prone to mass political violence than others do, despite the presence of "angry" individuals in each, or why some states produce more relatively deprived individuals than others do. As a microlevel analysis of civil wars, the study cannot explain macrolevel factors.

The point should be made that these are not criticisms of the works inasmuch as they are illustrations of the gap that exists when authors employ different levels of analysis. A few studies do attempt to bridge this gap, however. For one, Mason (2004) discusses the motivations individual

peasants have to join revolts but also demonstrates how certain state properties, such as land-tenure patterns, change peasants' calculi and makes some states more prone to peasant revolt than others are. Mason explains why some peasants choose violence and some do not, as well as why some states seem more prone to peasants who choose violence than other states do. And it is likely that this approach represents the immediate future of the field. That is, integration of the various levels of analysis appears to be on the uptick, although scholars must beware that in integrating, they do not conflate the levels.

Theories About Civil War

Having introduced the most prevalent conceptualizations of civil war, as well as some of the different issues that go along with empirically investigating the concept, this chapter now turns to highlighting some of the most prevalent theories on civil war. This section focuses on theories about the causes of civil war.

To know the root causes of civil wars has been the quest of most civil war researchers. In order to explain the incidence of civil wars, scholars typically take one of two approaches. One approach is rebel based; the other is state based. Theories belonging to the rebel-based approach seek to explain what motivates or encourages substate groups to issue a competing claim to the right to impose a sociopolitical order and, ultimately, to engage in political violence in an effort to substantiate their claim. Two general categories typify the explanations for rebel behavior: greed and grievance (Collier & Hoeffler, 2004).

Greed

Proponents of the greed explanation argue that rebels fight only when there is something to be gained by winning and when the probability of winning is sufficiently high (Collier & Hoeffler, 2004). In other words, civil wars are thought to occur because rebel groups have something economically tangible to gain by winning and have reasonable expectations of winning. The theories within this category therefore tend to focus on variables related to rebels' opportunities.

Two articles demonstrate the key dimensions of the greed, or opportunity, theory. Collier and Hoeffler (2004) demonstrate that rebellions occur when they can be financed. Factors that affect the financing capacity of rebel organizations therefore are critical variables to civil war discussion. One variable is the cost associated with paying recruits. Collier and Hoeffler explain that recruits forgo income to join themselves to a revolution. The benefits they get from joining and fighting must exceed this forgone income. Therefore factors that depress the income recruits could earn outside the rebellion shrink the cost per recruit for rebel organizations, which ostensibly means more recruits and a greater opportunity to succeed (Collier & Hoeffler, 2004).

Fearon and Laitin (2003) show that civil wars are more likely to occur in nation-states where rebels can employ *insurgency*: "Insurgency is a technology of military conflict characterized by small, lightly armed bands practicing guerrilla warfare from rural base areas" (p. 75). Consequently, in employing insurgency, rebel groups reduce their need for more recruits, which drives down the cost of financing the rebellion. The practice of *limited engagements* also reduces costs by lessening the need for stockpiles of ammunition. In a sense, when factors enable insurgency to be used, the likelihood of conflict increases because the costs of financing the rebellion are reduced. So wherever insurgency is a viable technology, rebels have a greater opportunity to finance a rebellion, all else being equal.

The bottom line of each of these two articles is that rebellion is more likely to occur wherever it is more likely to be financed. Sources of financing, therefore, are critical (Collier & Hoeffler, 2004), as are factors that affect the amount of financing required—that is, whether potential recruits must forgo relatively high incomes (Collier & Hoeffler, 2004) or whether rebels can employ a cost-reducing technology such as insurgency (Fearon & Laitin, 2003). To be sure, many more articles touch on other factors related to the greed theory, but these two articles highlight the major facets that link rebels' opportunities to the incidence of civil war.

Grievance

The alternative rebel-based theory of civil war incidence is based on *grievances*. It argues that what drives rebellion is the desire to reform or remake the extant sociopolitical order because of its apparent lack of fairness. According to this theory, rebels fight to rectify social injustices they face. The causes of rebellion, then, are the factors that contribute to perceived social injustices. For this reason, inequality—in a variety of forms—and relative deprivation are the two main foci of the grievances explanation.

Inequality, especially income inequality, aggrieves people (Muller & Seligson, 1987). Inequality by itself, though, does not convert grief to anger and anger to action. Anger is fomented when the inequality is seen as unjust or illegitimate. Such situations occur when the prospects of achieving what one believes one has the right to achieve are low (Gurr, 1968), and such situations are furthermore exacerbated when the relative deprivation is thought to have been foisted on the downtrodden—either formally or informally—by a rival ethnic group (Horowitz, 1985). Under this theory, civil wars represent violent attempts to correct years of perceived mistreatment, not opportunities exploited by rebel entrepreneurs.

Of course, some question whether greed and grievance theories are mutually exclusive. Greed and grievance can interact (Kalyvas, 2003), which would explain why some cases of severe relative deprivation persist and why not all ethnically heterogeneous societies conflict. In the former, despite a reason for rebellion, the opportunity to rebel may

not materialize. In the latter, while resources may be plentiful such that rebellion is financially feasible, there may be no relative deprivation worth rectifying; outcomes might be in line with expectations. In either case, employing one theory seems insufficient to explain the observed behavior. Rebels' motivations in civil wars may at once be born of greed and of grievance.

State-Based Explanations

Much of the literature on why or how rebels fight takes for granted the state's role in civil wars. States tend to be treated as a constant in the civil war calculus. Yet states have many components, and it is not unreasonable to build theories of civil war based on differences in these components. For instance, it could be that certain types of states tend to produce relatively high degrees of inequality or that certain state characteristics tend to yield more and greater opportunities for rebels to finance their operations. Whatever the case may be, there is little doubt that differences in state characteristics exert some effect on the incidence of civil wars. Consider the following examples of state strength and democratization.

Weak states tend to be more prone to civil wars than do strong states (Fearon & Laitin, 2003). The reason civil wars occur in weaker states more readily than in strong states is twofold. First, weaker states tend to be incapable of imposing sociopolitical order throughout their entire territory, which includes providing equal protection and services to all citizens (Migdal, 1988). Weak states tend to be more prone to state-sponsored inequality (Migdal, 1988). This opens space—both figuratively and literally—within which rebels can emerge. Second, weak states are more likely to resort to indiscriminate violence against civilians in order to flush out rebels because the state's intelligence-gathering mechanisms tend to be poorly developed as other aspects of the state (Mason & Krane, 1989). The cumulative effect of state weakness, then, is to give rebels more cause to fight and to make insurgency a more viable option, which in turn makes financing the rebellion more feasible (Fearon & Laitin, 2003). Other theories about state capacity and civil war exist, but most of these are either elaborations or qualifications of the theory as presented here.

The level of democratization also appears to have important implications for states' vulnerabilities to civil war. Democracy preempts rebellion because it decreases the incidence of grievances by giving individuals a voice in the government and permits individuals to coordinate together politically in an effort to work to peacefully remedy perceived inequities (Hegre, Ellingsen, Gates, & Gleditsch, 2001). Coherent autocracies, on the other hand, preempt rebellion by prohibiting the political coordination needed to generate mass violence (Hegre et al., 2001). Where civil war is most likely to occur, then, is among states that suffer from institutional incoherence that fosters grievances, on one hand, and still has elements of openness, on the other hand, which permit individuals to come together and coordinate

their efforts to effect political change (Hegre et al., 2001). Therefore, states characterized by some democratization and some autocratic tendencies tend to be those most prone to conflict. Again, state characteristics are shown to influence the incidence of civil war.

Policy Implications

Understanding the nature of, and causes of, civil wars has profound implications for policy. Presumably, the better scholars understand what factors most likely contribute to civil war, the more likely it is that policies aimed at addressing those factors can be authored and implemented. For instance, consider Horowitz's (1985) discussions about how to resolve ethnic conflict. The resolution directly addresses what Horowitz found to be an important cause of ethnic division, namely, that political fates are often tied to ethnicity. Even democracies can be rife with ethnic conflict if parties form along ethnic lines because again political fate will be directly tied to ethnicity. To resolve this dimension, Horowitz proposes that certain institutions be in place that bring about political parties that cut across rather than reinforce existing ethnic cleavages. That is, parties should be introduced that reflect sociopolitical interests that put coethnics at political odds with each other.

As another example, the fact that institutional incoherence produces vulnerabilities to civil war suggests that researchers should find more effective ways of promoting the transition from autocracy to democracy (Hegre et al., 2001). That is, states appear most susceptible to civil war in the stages of polity transition. The implication is that if democratization is to continue, then ways to minimize the institutional incoherence during transition, as well as to reduce the amount of time spent in transition, are needed.

Finally, understanding the dynamics of the conflicts might also foster policies that can effectively end civil wars that do break out. The statement assumes a link between conflict causes and conflict termination. The veracity of the assumption holds implications for policymakers. In either event, knowing would enable more effective policies to be implemented to end civil wars that do commence.

Conclusion

The scholarly understanding of civil wars is undoubtedly growing. Researchers are now able to wed rebels' motivations and opportunities with theories about state characteristics and civil war onset. For the advancements to continue, however, there needs to be more focus on a standard conceptualization and subsequent operationalization of civil wars. The problem is that researchers will continue to arrive at conclusions based on different cases, which erodes the ability to broadly apply the lessons learned from these studies. Of course, much progress has been made, and civil war research is not the only field that faces

questions about the concept under investigation: Astronomers argue about what makes a planet a planet; physicists still cannot agree on the correct specification of the atom; and literary scholars still debate the identity of Shakespeare. So to say that the concept of civil war needs refinement, then, is not a harsh criticism at all. Rather, it is recognition that better conceptualization and operationalization could lead to discoveries that become significant contributions to the human pursuit of progress and peace.

Notes

1. Moreover, it would seem that the interstate wars in which the systemic order is of issue would be the large, infrequent hegemonic wars where one or more states attempt to establish a hierarchy (Organski & Kugler, 1981).

2. It is perhaps arguable that they even had an incentive to see that the sociopolitical order persisted.

3. It might be reasonable, too, to split civil wars into subtypes because the idiosyncrasies of civil wars in which states are disputants and of civil wars in which claimants are disputants might differ (see Stephens & Liebel, 2008, for example). For the purposes of this chapter, though, it suffices to show that conflicts occurring in territories of failed states can be classified as civil wars.

TERRORISM

ERIK S. CASE

University of North Texas

Since September 11, 2001, considerable attention has been devoted to the study of terrorism, yet scholarly analysis of the subject has actually been active for several decades. With this increased focus, confusion has arisen as to the very meaning of *terrorism*. In addition, there are competing theories in regard to the causes and effects of terrorism, with contributions coming from economists, sociologists, psychologists, and political scientists. The study of terrorism is truly a multidisciplinary endeavor. This chapter provides a review of the debate regarding the definition of terrorism, presents historical examples of terrorism to provide context, and introduces the primary theoretical and empirical contributions of major scholars in the field.

Defining Terrorism: A Distinct Form of Political Violence?

The term *terrorism*, like *globalism*, is difficult to define and has a diversity of meanings among different groups and individuals. As a common cliché says, “One man’s terrorist is another man’s freedom fighter.” The shifting contexts in which the term is used make it difficult, but not impossible, to study the phenomenon as a distinct form of political violence. For the purposes of empirical analysis, terrorism must be defined explicitly. This chapter offers such a definition, while acknowledging that it

may differ from that of other scholars, cultures, governments, media outlets, and perhaps the reader. It is useful to examine first the evolution of the usage of the term throughout history. Although examples of terrorism stretch back several millennia, the word *terrorism* is relatively new to the world stage.

A Historical Review of the Terminology

The first usage of “terrorism” was in reference to the actions of a nation, not a subnational group. After the French Revolution in the late 18th century, the victors conducted a brutal campaign against nobles perceived to be enemies of the newly formed state. The series of mass executions by the postrevolutionary government was referred to as *the terror*. This early conceptualization differs from the more modern use of terrorism, in which the perpetrators are not usually governments and are instead nonstate actors (Laqueur, 2001). The usage of *terrorism* to refer to the violent actions of nonstate actors arose in response to the bombings and assassinations conducted by radical members of political movements such as anarchism and revolutionary socialism in the late 1800s and early 1900s. During the 20th century, the use of the term expanded immensely, often to include any type of political violence that the observer found to be disagreeable. This is where the murkiness of *terrorism*’s meaning arises. Politicians and the media are quick to label any enemy violence as

terrorism. When any act of violence one disagrees with constitutes terrorism, the concept loses its meaning as it has become highly contextual and subjective. This is why we see certain acts of violence covered as terrorism by certain media outlets and as legitimate resistance by others. The atmosphere of confusion is not helped by the fact that, between governments and researchers, there are more than 100 different working definitions of terrorism. In addition to these observations, Jenkins (1974) pointed out the relativistic nature of the term when he wrote that terrorism seems to mean simply whatever the “bad” guys are doing. Merari (1993) echoed this when he noted that the term had become more of a derogatory epithet than an adjective describing a unique phenomenon.

Developing an Explicit Definition

If *terrorism* is simply a subjective catchall term for many types of political violence, why then is it given its own chapter in this handbook? The answer is that, although the expression can be carelessly or intentionally misused by political figures and media outlets, there is a general consensus among scholarly researchers that terrorism is a distinct form of violence, different from riots, coups, inter- and intrastate warfare, and so forth. Tilly (2004) contended that the definition should be based on characteristics of perpetrators and victims. That is certainly a good starting point.

First, an examination of the nature of the victims is in order. By far, this is the most controversial definitional aspect of terrorism. Take, for example, the 1983 suicide bombing of a United States marine barracks in Lebanon by the militant group Hezbollah. The strike occurred after U.S. troops were sent in to mediate an increasingly violent civil war, and well over 200 soldiers were killed. The attack is almost universally referred to as terrorism, but this is problematic. The victims in this case were armed security personnel stationed in a war zone. If every surprise attack on active armed forces is considered terrorism, there is little to distinguish terrorism from unexpected attacks that occur in conventional warfare. Hence, many scholars believe that terrorism involves violence directed at civilians. That is to say, the victims of terrorism are not actively or officially involved in a violent conflict.

Second, it is important to distinguish the characteristics of the perpetrators of terrorism. History is replete with examples of nation-states targeting civilians, whether their own citizens or individuals in other countries. Traditionally, though, such actions are referred to as *state terror* or *war crimes*. More often, those designated as terrorists are members of subnational groups, meaning they do not have the characteristics of a modern state, such as holding a monopoly on the *legitimate* use of violence in keeping with the classic Weberian definition in an internationally recognized, geographically defined territory or fielding a conventionally equipped army and navy. Examples of such nonstate actors include transnational groups such as

al Qaeda or regionally based rebel groups such as the Basque separatists Euskadi Ta Askatasuna (ETA) in Spain. It follows, then, that another criterion for a violent act to be considered terrorism is that it be committed by nonstate actors. Note that excluding state terror or war crimes from falling under the rubric of terrorism does not pass a moral judgment regarding the reprehensibility of such acts. In fact, the goal of this section of the chapter is to arrive at a definition that is as free from subjective moral, or “normative,” conditionality as possible. Discarding some of the emotional and moral baggage that accompanies the loaded term will allow us to arrive at a more analytically useful conceptualization.

Beyond the nature of the attacker and the victims, it is important to analyze motivations behind terrorist acts. If we were to stop with the definition we have now, any violent crime committed by one civilian against another would be considered terrorism. However, there appears to be something qualitatively different that distinguishes the violent crimes committed by individuals and groups motivated by the desire for economic gain from the violent crimes committed by terrorist organizations. For example, there appears to be a fundamental difference between violent groups such as Hamas in the Palestinian territories and violent groups such as the Sicilian Mafia in southern Italy. Both are nonstate actors that use violence against members of a civilian population, but the distinction lies in the goals of the organizations. Hamas desires to destroy the Israeli state and claims to fight for a Palestinian homeland—a political goal. Organized crime outfits such as the Mafia have no such political intentions. They may have political connections in the form of corruption and bribery, but their aspirations essentially revolve around making money. Groups that use terrorism have political goals that extend beyond the immediate consequences of an attack. In other words, they seek to effect political change by committing violent acts against civilians. Political change can take a variety of forms. For example, terrorism can be used with the aim of changing or gaining policy concessions from a particular government or of destabilizing that government altogether. It can also be used to gain domestic support from an aggrieved group by demonstrating a willingness to fight for a cause. Thus, a final condition for a violent act to qualify as terrorism is that it be motivated by a desire to influence a political outcome. This is not to say that those who use terrorism cannot also engage in organized crime (the Taliban in Afghanistan and the Fuerzas armadas revolucionarias de Colombia, [Revolutionary Armed Forces of Colombia; FARC] turn huge profits by trafficking in narcotics), but their goals are primarily political in nature. This last condition excludes several other types of violence. For example, hate crimes without any known motivation beyond the immediate act would not be considered terrorism. Violent crimes committed by the mentally disabled, such as the attempted assassination of President Ronald Reagan by John Hinckley, also do not have an ultimate political motive and would not fall under terrorism.

Therefore, the working definition of terrorism developed in this chapter is as follows:

Terrorism is the use of violence against civilians and is perpetrated by nonstate actors with the intent of achieving some political outcome.

This definition is by no means the authoritative final word, and there remain several gray areas. Some terrorist groups have skillfully stretched the meaning of *combatants* to apply to virtually every citizen of the state that they oppose. Below are some alternate definitions illustrating the fact that, even within the U.S. government, competing definitions exist:

Terrorism is the use of force or violence against persons or property in violation of the criminal laws of the United States for purposes of intimidation, coercion, or ransom. (U.S. Federal Emergency Management Agency, 2009, para.1)

[Terrorism is] premeditated, politically motivated violence perpetrated against noncombatant targets by subnational groups or clandestine agents, usually intended to influence an audience. (U.S. State Department, 2001, “Definitions,” para.1)

Terrorism can be practiced alongside other modes of violence. For example, a rebel group can choose to use hit-and-run attacks against military targets while also conducting strikes against a civilian population. In such a case, terrorism is one component of the group’s overall strategy of warfare. It can be expanded, put on hold, or altered according to the decisions of the group’s leader or leaders. This occurred in the case of the African National Congress (ANC), which used terrorism in its fight against the South African apartheid-era government. When the apartheid government finally collapsed and the ANC took over the reins of power, it no longer conducted terrorist attacks. As a result of such examples, terrorism is treated in this chapter as a *tactic that can be used strategically*. Repugnant though it may be, terrorism is a method for achieving an objective, and *terrorist groups* may more accurately be considered to be groups that use the tactic of terrorism.

Historical Examples of Terrorism

The works of Enders and Sandler (2006), Laqueur (2001), Hoffman (1998), and White (1998) together provide a fascinating account of the history of terrorism. Although the term is relatively new, there are many historical examples of nonstate actors using violence against civilians with the broader goal of influencing a political outcome. One of the famous early examples was that of the Sicarii. The group’s name derives from its preference for using *sica*, or long knives, when attacking its targets. During the middle of the 1st century, Palestine was occupied by the Roman Empire. A rebellious Jewish group known as Zealots chafed under Roman rule and actively agitated for the removal of the

Roman regime. Within the Zealots, a more radical sect existed, the Sicarii, who felt that violent overthrow was the most appropriate course of action. The strategy of the Sicarii was what would become a classic element of terrorist violence: to provoke a government (in this case, that of Rome) into an overreaction that would, in turn, drive more supporters (in this case, fellow Jews in Palestine) toward the terrorists’ cause. The Sicarii embarked on a campaign of assassinations directed against Roman officials and fellow Jews deemed to be collaborators. Historical reports indicate that the Sicarii assassinated their victims in broad daylight and among crowds of people to maximize the dramatic effect. The group also attacked infrastructure, damaging the water supply and destroying agricultural and financial targets.

Operating from the 11th to the 13th centuries in Persia and Syria, a group known as the *Assassins* was a violent splinter group from the Ismaili religious sect. The Assassins were a small group motivated by a desire to protect their religious practices from repression by rival factions, and they held sacred the act of eliminating their victims with daggers. Because of the limited manpower of the Assassins, their leader realized they could not confront the government head-on and instead opted for a sustained campaign of assassinations. Among their most prominent victims were high officials of government, including the king of Jerusalem. The premium that the Assassins placed on dying for their cause, which they believed to be an act of martyrdom, would be echoed by religious extremists in far more recent times.

Religious fanaticism and radical separatism are not the only motivating ideology among groups that used terrorism in history. In the mid-19th and early-20th centuries, a political movement known as *anarchism* became popular in Europe and North America. The ideology advocated the dissolution of all forms of government, deeming them inherently exploitative and unjust. Some anarchists rejected the more traditional means of political expression, such as protests and the dissemination of propaganda through pamphlets. Rather, they advocated what has been called “propaganda by deed.” Using violent action to demonstrate by example is a thematic element found among practitioners of terrorism. Violent anarchists in France, Italy, Britain, and the United States were not coherently organized groups, and their targets and methods differed. In Italy and France, there were several high-profile assassinations of government officials and merchants deemed to be part of the corrupt state apparatus. The technological advances that have occurred since the Assassins now allow for a new type of terrorism that has become emblematic of the modern era: the use of bombs. Dynamite was a weapon of choice among violent French and American anarchists, and the use of explosives in terror attacks has been adopted by an ever-widening array of groups in the last two centuries.

The systematic campaign of violence and intimidation directed toward Blacks and moderate Whites in the United

States by the Ku Klux Klan (KKK) is an infamous example of domestic, “homegrown” terrorism. The KKK was devoted to preserving the traditional dominance of Whites in the U.S. South, and this vision entailed violent actions designed to forcibly dissuade Blacks from participating in the political process. A ritualistic right-wing organization, the KKK was indelibly known for its practice of wearing white hoods and its pseudoreligious practice of burning crosses. KKK activities included a series of extrajudicial (outside the law) executions known as *lynchings*. The KKK used lynchings and other forms of violence to murder numerous individuals throughout the 19th and 20th centuries. In the 1960s, the KKK caused an international uproar when it planted a bomb in the basement of the 16th Street Baptist Church in Birmingham, Alabama. The resultant explosion killed four young girls and served to galvanize the civil rights movement that was emerging in the United States (National Public Radio, 2003).

Terrorism was a central strategy for gaining power within several political movements during the 20th century. Communist revolutionaries were among several groups using terrorism to agitate against czarist rule in Russia in the 1900s. By the time they achieved power in a 1917 coup, they had conducted three major campaigns of assassination against political enemies. The fascist Nazi party also used terrorism in its ultimately successful attempt to gain control over the German government prior to World War II. Thus, two of the most historically significant political movements of the 20th century, fascism and communism, made use of terrorism to successfully transition from being challengers of governments to becoming the governments themselves.

The post-World War II era heralded several new developments that came to characterize modern terrorism. First, the growing popularity and availability of commercial air flight presented new opportunities for groups aiming to conduct terrorist attacks. During the 1960s and 1970s, *skyjacking* was used effectively and often. In these hostage-taking situations, aircrafts were forcibly commandeered in flight or on the ground, and political demands were made by the hijackers. Defensive countermeasures taken, such as the installation of metal detectors at airports, helped to greatly reduce the number of terrorist hijackings in the 1980s and 1990s. Second, the 1980s saw the advent of suicide bombing, first used by the Lebanese group Hezbollah and refined by the Liberation Tigers of Tamil Elam (LTTE) separatists in their fight for an autonomous homeland separate from the Sri Lankan government.

Al Qaeda and the September 11 Attacks

Following the September 11, 2001, attacks, the U.S. government tasked the National Commission on Terrorist Attacks Upon the United States to create a comprehensive account. The Commission produced the *Complete 9/11 Commission Report* (2004), which is a massive and freely

available online resource that is easy to read and highly recommended for students interested in a more thorough accounting of the attacks. The following account is primarily derived from the *Complete 9/11 Commission Report*.

In 1978, the Soviet Union invaded the Central Asian nation of Afghanistan. A rugged geographic region characterized by a tribal society, Afghanistan was home to several million Muslims of differing ethnic backgrounds. The possibility of an atheistic Communist regime occupying a Muslim nation proved to be an incendiary prospect for many Muslims across the world. It also presented an opportunity for governments in the Middle East, such as Saudi Arabia and Pakistan, to export young radicals to fight the Soviet occupation. In doing so, these governments gained stature as defenders of the Muslim faith while also relieving themselves of the internal security threat these radicals represented. The United States, Soviet Russia’s primary cold war enemy, also provided funding for some of the groups battling the Soviets. These groups were by no means uniform in their methods and motivations, and after their victory over the Soviets in 1989, they proceeded to battle among themselves, plunging Afghanistan into another decade of statelessness and civil war. One of the many foreigners who traveled to Afghanistan to fight against the Soviets was Osama bin Laden, the son of an immensely wealthy Saudi Arabian construction magnate. After the Soviets left Afghanistan, bin Laden was instrumental in maintaining a cadre of followers that eventually became known as al Qaeda.

Bin Laden was largely the financier of al Qaeda, and his deputy, Egyptian physician Ayman al-Zawahiri, headed up operational control of the organization. Espousing a radical version of Sunni Islam and inspired by the Muslim Brotherhood, the al Qaeda leadership was determined to battle any party it perceived to be hostile toward its austere version of Islam. Bin Laden blamed the suffering of fellow Muslims on corrupt Middle Eastern regimes, whom he perceived to have betrayed the faith, and the actions of Western governments, particularly the United States. When Iraq invaded Kuwait in 1991, the neighboring Saudi regime became concerned that it was Saddam Hussein’s next target. Bin Laden offered the protective services of his fighters, but the Saudis, wary of importing the same figures that helped topple the Soviets, instead opted for protection from the United States, allowing U.S. military forces to use Saudi territory as a launching pad for the first Gulf War. The prospect of foreign troops on Saudi soil (home to the two most holy sites in Islam: Mecca and Medina) proved to be intolerable to al Qaeda. The organization also held grievances against the United States for the country’s support of Israel and other Middle Eastern governments that al Qaeda held a deep enmity toward. Thus, the United States became a primary target of the organization.

In 1998, bin Laden and al-Zawahiri held a news conference to announce the issuance of a religious edict. In it, they claimed it was the duty of every observant Muslim to attack Americans whenever and wherever possible. Soon

afterward, bin Laden clarified that the group made no distinction between American troops and civilians, reasoning that civilians in a democratic society were directly responsible for the policies of a government they voted for. Several terrorist attacks attributable to al Qaeda had already occurred by the time the 1998 edict was issued, but none at that point had been as large as the two simultaneous vehicular bombings of U.S. embassies in Sudan and Kenya that followed that summer. The bombings killed hundreds of civilians, mostly Muslim East Africans. This irony did not go unnoticed by al Qaeda, which, hoping to be the vanguard for disaffected Muslims throughout the world, had already embarked on more ambitious plans to attack Americans directly.

Some time that same year, bin Laden purportedly gave approval for the September 11, 2001, attacks. The operational planning for this task was largely delegated to a man known as Khalid Sheikh Mohammed. Born in Kuwait and college educated in the United States, Khalid Sheikh Mohammed reportedly claimed to have gotten the idea for a plane attack on the World Trade Center (WTC) after his nephew's 1993 attempt to destroy the towers with a vehicle bomb failed. Throughout 1999, the plan progressed as candidates for the operation were recruited, trained in Afghanistan, and secured visas for entry into the United States. While in the United States in 2000 and 2001, the hijackers attempted to blend in as visiting students, and select members attended flight training school.

By 2001, the U.S. government had indications that al Qaeda was planning a massive attack on the homeland, but the government was unable to connect the bits and pieces of intelligence, spread across several governmental agencies, into a coherent enough picture to stop the plot before its execution. The nature of the attack was also unexpected because there had never been one like it before. There had been suicide bombings in other countries, but no one had ever combined suicide attacks with airline hijacking. The conventional model of hijacking and hostage negotiation was not part of the plan, and few, if any, predicted that entire commercial airliners could be taken over and commandeered with items as seemingly innocuous as box cutters. Thus, most of the world was shocked when 19 men hijacked four planes on September 11, crashing three of the planes into their intended targets—the WTC towers and the Pentagon—while the fourth was brought down in a Pennsylvania field when the passengers fought to retake control of the aircraft. The attacks resulted in the destruction of the WTC towers and part of the Pentagon, with more than 3,000 civilians murdered. The size and scope of the operation are without parallel.

Historical Patterns

A few patterns emerge in this brief, and by no means exhaustive, historical review of the occurrence of terrorism. These patterns have guided much of the research in

academia. First, groups that employ terrorism come from a variety of ideological backgrounds. Some, like the Assassins, were religiously motivated. Others were devoted to a left or right wing political cause, such as the anarchists or the KKK. Groups such as the LTTE aimed to carve out a piece of territory for their ethnic kin. These motivations are not mutually exclusive. For example, the Sicarii were a religiously motivated group that *also* sought an element of territorial control. The primary lesson to draw is that no one extreme political or religious ideology dominates the use of terrorism. The backgrounds and motivations of these organizations are highly diverse, and attempting to uncover a single, overarching ideology among them all is a fruitless endeavor. Second, a similar amount of diversity is found across time and geographic region. Although the methods of implementation have shifted with technology, terrorism is not a new phenomenon, and it is not restricted to one region of the world. Third, all the previously mentioned groups, at least initially, lacked the size and ability to field regular armies that could mount a direct challenge to governmental authorities. This makes sense because, by definition, groups that use the tactic of terrorism are nonstate actors. However, some movements have grown large enough to challenge authorities by more conventional military means, being able to simultaneously pursue guerrilla campaigns or fight traditional battles while also conducting terrorist strikes. Last, the attacks conducted by various terrorists were intended to provoke a response, whether from the element of society they were challenging, the societal groups they claimed to be fighting for, or both.

Theoretical and Empirical Contributions to the Study of Terrorism

Terrorism studies, as a subfield of political science, are a relatively new endeavor. They do not have the level of development we find in other arenas of political science, such as the study of interstate war or internal revolutions. Despite that, there have been some major developments in the field during the past three decades. This portion of the chapter analyzes some of the seminal works on terrorism and reports some of the critical empirical conclusions from this area of study.

The Causes of Terrorism

Individual and Group Motivations

As is often the case with the study of some unique social phenomenon, the first efforts were primarily aimed at explaining its causes. There is also much to be learned from the effects of terrorism, but understanding the origins of terror is of primary importance. Jenkins (1974) produced an analysis for the U.S. Congress that contained considerable insight into the nature of terrorism. Jenkins

forcefully argued against the perception that terrorism was the work of senseless, mindless, and irrational actors. Attacks on civilian targets shock the conscience, and the seemingly random, chaotic carnage that is produced by terrorism understandably gives the impression to many that it is the work of insane individuals. This impression may even be intentionally cultivated by terrorist practitioners themselves, and the media also play a role in casting terrorists as lunatics, but the evidence belies this assumption. Jenkins's work noted that practitioners of terrorism had concrete political goals and did not simply engage in violence for the sake of violence in the way that sociopathic criminals might. Rather, because terrorist groups often lack the resources to mount a direct challenge to government security forces, they shift their focus to "softer," less fortified targets, such as civilians. The often indiscriminant nature of attacks on civilians garners the most attention, so while the purpose of a more conventional military operation may be to take and hold a piece of territory, the terrorist attack is designed to influence an audience beyond that of the immediate victims. Often the goal is to create a climate of panic and to expose a government's inability to prevent such indiscriminate violence. Because of these unconventional goals, Jenkins cast terrorism as a form of political "theater" in which the harm suffered by the immediate victims of terrorism is of secondary importance to the group conducting the attack. Take, for example, the September 11, 2001, attacks. The perpetrators chose targets that were steeped in symbolism. The Pentagon and the WTC were prominent symbols of American financial and military might, readily recognizable as such by both American citizens and the worldwide audience that witnessed the attacks. The attacks sent a message that the citizens and institutions within the United States mainland were not safe, and the atmosphere of fear following the attacks was palpable. The name Osama bin Laden gained universal recognition, while al Qaeda became the object of unceasing media attention. Yet despite the disastrously large death toll, the average American citizen's chance of being harmed in such an attack remained infinitesimally small. For the average person, the chance of being felled by a heart attack or car accident was far greater than that of being struck down by al Qaeda, yet terrorism became the central issue for several election cycles following the attack. These facts give credence to Jenkins's argument that terrorism is theater: a spectacle designed to attract maximum attention and create massive emotional impact. It became clear that one of the reasons terrorism occurs is the massive amount of attention it can attract without being cost prohibitive for small organizations.

Crenshaw (1981) was one of the earliest political scientists to conduct research on terrorism. She concluded that terrorism was not necessarily the result of broad public dissatisfaction with the political order or evidence of a fractious society. Rather, Crenshaw contended, terrorism was often the result of the grievances of a disaffected group that had originated in the elite and claimed to fight

for a larger group. This conclusion was reasonable given the makeup of left-wing terrorist groups that had dominated the news in the previous two decades. While claiming to fight for the downtrodden worker, groups such as the Red Army Faction in Germany were largely composed of students from upper- or middle-class origins. Their parents were academics, clergy, writers, and other professionals, yet the students became disaffected and alienated from the societies that spawned them. Crenshaw believed that psychological factors such as guilt, desire for vengeance, and a thirst for excitement were the primary motivations of individuals who participated in terrorism.

The idea of a *rational terrorist* has very real policy implications for counterterrorism officials. If an enemy is mentally deranged, irrationally lashing out at random targets, there is little use in trying to predict when, where, and how that enemy will strike. However, if an enemy is calculating, weighing the costs and benefits of conducting an attack, policymakers and analysts are more likely to be able to get an idea of what targets the enemy will select and how it will attack them. It is no surprise, then, that many researchers take the rational choice approach when modeling terrorism. In this research strategy, the choice of whether to participate in terrorism is contingent on the cost-benefit ratio for the principal actor, the terrorist. Scenarios are often presented as a game wherein an actor takes a turn, choosing whether to use terrorism, and another actor, usually representing a government or counterterrorist agency, must choose a response while considering that the terrorist opponent will be trying to predict the agency's strategy (Lake, 2002). The key, then, is determining what particular conditions create a payoff structure for potential terrorists sufficient to entice them to commit the violence despite knowing what the counterresponse will be. More simply put: What conditions cause terrorism to be worthwhile to certain groups and individuals despite the risk? The following section describes various theories regarding those conditions. Attributing thought and rationality to terrorism is controversial as many are reluctant to admit any quality but insanity to such a reprehensible form of violence, but the idea of the *strategic terrorist* is one of the dominant themes in academic research on the matter.

However, the rational choice approach has been criticized as unrealistic. Individual interviews of terrorists have often revealed no such cost-benefit analysis among the terrorists that were studied. Sometimes the choice to participate is based on a desire for revenge rather than a sober calculation of the possible costs and payoffs. One failed suicide bomber noted his spiritual motivations for engaging in terrorism, an inspiration that is not easily modeled by rational choice (Hassan, 2001). Perhaps the only blanket statement that can be made about the "average terrorist" is that he or she is willing to undertake extreme risk. That said, different motivating factors may drive the foot soldiers of terrorist groups and their leaders. It seems more reasonable to expect that the leaders of groups that utilize

terrorism do look at the “big picture” and consider the benefits and risks of various oppositional strategies.

Structural Causes of Terrorism

Rather than focus on the individual psychological calculations of the individual terrorist, some researchers have put forth causal arguments based on the institutional and structural features of a society. One such argument revolves around the supposed connection between poverty and terrorism.

In both the literature and the culture at large, there is an expectation of a causal relationship between poverty and terrorism. Following September 11, 2001, politicians such as former Vice President Al Gore and President George W. Bush argued that combating terrorism should involve efforts to eradicate poverty and increase education in the world’s troubled hot spots. Academics too have prescribed the lifting of living standards in various regions in the hope of creating a disincentive for participation in terrorist activities. There is good reason to think that certain socioeconomic factors are determinants of terrorism. The lack of economic and educational opportunities has already been empirically linked to a variety of other problems, such as property crime, the occurrence of civil war, and instability within new democracies. The general theory is that poverty and a lack of opportunity increase the level of grievances among economically marginalized members of society and that a subset of an aggrieved population may choose to express its discontent violently by way of terrorism. However, the actual evidence of a connection between poverty and terrorism is mixed at best. Counterfactual examples include of the finding that many of the perpetrators of the September 11, 2001, suicide attacks came from educated, middle-class backgrounds. A profile of failed Palestinian suicide bombers in *The New Yorker* returned the same results (Hassan, 2001). Most of the young men interviewed had held jobs, were educated, and did not come from extreme poverty. On the other side of the Israeli–Palestinian conflict, an analysis of the Israeli Jewish Underground, an organization that attacked Palestinian civilians during the 1970s and 1980s, also found that a strong majority of members were highly educated and held prominent occupational positions. There is the possibility that although poverty or lack of educational opportunities is not prevalent among the practitioners of terrorism, it may be that poor socioeconomic conditions experienced by their ethnic or religious kin inspire a so-called Robin Hood model of terrorist activity. If this were the case, it would be more appropriate to analyze aggregated societal or country-level indicators of economic and educational conditions than the individual socioeconomic origins of the terrorists themselves. The empirical evidence does not conform to the conventional wisdom on that level of analysis, either. For example, a survey in the Palestinian territories found that unemployment actually reduced support for terrorism against the Israelis. Another study found

that, after controlling for civil liberties (on account of the fact that poorer countries are more likely to have fewer political freedoms), there is no statistically significant difference between poor and rich countries in terms of the number of terrorists that they spawn (Krueger & Maleckova, 2003).

The Effects of Terrorism

The rational choice approach is particularly helpful in examining the strategic expectations that terrorist practitioners have for the consequences of their acts. Specifically, there is evidence that terrorism is used to goad an overreaction from the target government or societal group (Bueno de Mesquita & Dickson, 2007; Lake, 2002). This strategy appeared to be in play among jihadist elements of the Sunni insurgency in Iraq.

Following the 2003 invasion by the United States, Iraq experienced an influx of religiously motivated fighters from neighboring Muslim countries (quite similar to the influx of fighters into Afghanistan in response to the Soviet invasion), who claimed to battle on behalf of the minority Sunni population. The Sunnis had held a position of privilege over their Shi’a counterparts during the rule of Saddam Hussein and were now facing the possibility of losing that status. These fighters, along with indigenous radical Iraqi Sunnis, formed the backbone of what would be known as al Qaeda of Mesopotamia. This regional al Qaeda franchise embarked on a series of gruesome executions and suicide bombings directed at the majority Shi’a population, killing scores of civilians. While some Shi’a leaders counseled restraint in the face of such attacks, the Shi’a population evinced a growing inclination toward self-protection and revenge. By the time al Qaeda of Mesopotamia blew up the Golden Mosque, one of Shi’a Islam’s holiest shrines, reprisal killings directed at Sunni civilians were well under way by Shi’a militants. In the following months, the country of Iraq descended into a vicious period of civil conflict, with spasms of indiscriminant killing on both sides (Frontline, 2007).

There is a coherent logic in attempting to spark a wider conflict through the use of terrorism. In provoking a disproportionate response by using terrorism, radical groups are able to pressure or shame moderate members of their community into supporting a violent approach. An extremist group without a large base of support can use as a recruitment tool the overreaction that they have intentionally caused. The Iraqi example was largely one of a disproportionate response from nonstate actors from one element of society directed at nonstate actors from another, but there are also examples of groups using terrorism to cause a government to overreact. The end result is the same: A disproportionate government response can radicalize previously fence-sitting moderates and drive them to support the extremists in their midst. Several rational choice studies have explicitly identified the causal link between overreaction and its effect of provoking further

violence (Bueno de Mesquita & Dickson, 2007; Mason & Krane, 1989). Specifically, governments and subnational groups seeking to respond to a terrorist attack often suffer from an information problem. Because of the secretive nature of terrorist organizations, it is exceedingly difficult to identify the specific perpetrators and punish *only* them. Often, the counterattack response to terrorism is indiscriminate, harming people who had no connection with the original terrorist activity. This was certainly the case in Iraq, where simply having a Sunni-sounding last name was often enough to warrant execution by Shi'a militia members. Imagine, then, how the calculated expectation of the risk of participating in violence changes for an individual in the face of indiscriminate violence. Beforehand, the level of risk derived from joining a violent organization exceeded the potential payoff gained by simply sitting on the sidelines and waiting the conflict out. In the face of indiscriminate violence, where one is equally likely to be harmed regardless of whether he or she had previously participated in violent activity, it becomes less risky to join a violent organization. In fact, it may appear to be in an individual's *best* interest to join such a group because at least the individual is offered an element of protection by doing so. It is no surprise, then, that from the Sicarii to al Qaeda in Mesopotamia, terrorism has been strategically employed to foment higher levels of violence and gain supporters.

The Economic Effects of Terrorism

Assessing the economic impact of terrorism has proven to be one of the most quantitatively rigorous areas in the field of terrorism studies. Economic damage has been an implicit or explicit motive behind several terrorist movements. Osama bin Laden drew lessons from the economic toll inflicted on the Soviet Union during its invasion and occupation of Afghanistan and advised his followers to conduct strikes on Middle Eastern oil facilities in hopes of causing similar economic pain on the energy-reliant Western nations (Associated Press, 2004). Based on the logic that violence will reduce an important source of revenue for the target government, many high-profile attacks are conducted at popular tourist destinations. Indeed, an economic analysis by Enders and Sandler (1991) of terrorist attacks in Spain found that the average attack caused the number of tourists visiting the nation to decrease by approximately 140,000 people in a year. A similar investigation of terror attacks in Italy determined that a typical strike resulted in a shock to the level of tourism that took a full year to dissipate (Enders, Sandler, & Parise, 1992). Beyond affecting specific industries, terrorism appears to have macroeconomic consequences as well. It is interesting that, although terrorist attacks appear to have only a temporary, and small, negative impact on the gross domestic product of nations, a more significant and positive relationship exists between terrorism and government spending (Blomberg, Hess, & Orphanides, 2004). While the goal of

an attack may be to cause economic harm by bleeding a government, an ironic consequence is that governments respond to an attack by investing in counterterrorist measures that require matériel and personnel, thus mitigating some of the economic damage caused by the strike.

The Consequences of Suicide Attacks

Scholarly analysis has demonstrated that suicide bombing, although horrific and repugnant, can produce tangible benefits for groups seeking political change through violence. Sprinzak (2000) noted that suicide bombing is one of the most psychologically effective methods because it communicates the message that there is no deterrent that can dissuade the attacker. Before the popularization of suicide bombing by groups such as Hezbollah in Lebanon and the Tamil Tigers in Sri Lanka during the 1980s, it was largely, and erroneously, assumed that, although willing to engage in extreme risk-taking behavior, even terrorist practitioners put a certain premium on their own lives. However, as studies by Sprinzak and a highly influential piece by Pape (2003) observed, what may seem irrational on an individual level may be quite logical at the group level. That is, terrorist groups may benefit from the use of individual members to conduct suicide attacks, whereas the individual conducting the attack may not.

In addition to the psychological impact suicide terrorism causes, the tactic offers several advantages for groups willing to engage in extreme violence. First, in terms of material cost, suicide terrorism is cheap. The amount of explosive needed to rig a human bomb is small, and the monetary costs for acquiring the components are minimal to the group. Second, the operational complexity of planning a suicide attack is greatly reduced when there is no need for an exit strategy for the attacker. Third, the suicide attack is, on average, more deadly than any other form of terrorism. Pape's most controversial argument concerned the effect of suicide attacks. He argued that the reason suicide attacks increased in popularity is that terrorist groups observed that they were successful in gaining territorial concessions from democratic states. For example, Hezbollah successfully drove the U.S. Marines and French paratroopers out of Lebanon following two massive suicide bombings. The use of suicide terrorism by the LTTE coerced the Sri Lankan government into establishing an autonomous region for the ethnic Tamils in the early 1990s. Israel abandoned the Gaza Strip and West Bank in the mid-1990s as a consequence of being targeted by suicide bombers. Pape believed that democracies are susceptible to the effects of suicide bombing because, unlike autocracies, they are accountable to a public that recoils at such attacks. The free and open media that are characteristic of a democracy are also better able to publicize attacks than are their state-controlled counterparts in autocracies.

There are some shortcomings with Pape's work. Some of the targeted nations characterized as democracies in his

analysis did not possess convincing democratic credentials. There are also cases of suicide attacks directed at decidedly authoritarian regimes, such as the Saudi monarchy. Furthermore, because of the closed nature of the media in authoritarian states, many examples of suicide bombings may have gone unreported. Ultimately, though, Pape's argument can be extended to terrorism in general: It is popular because it sometimes works in achieving the goals of the groups that use it.

Conclusion

This chapter has illuminated several aspects of the form of political violence known as terrorism. The phenomenon differs from other forms of political violence. It has occurred within many different periods, regions, and cultures and has been executed under a variety of ideological auspices. The theoretical and empirical contributions of various social scientists have advanced the study of terrorism into an academic subfield with significant explanatory power.

POLITICAL AND MILITARY COUPS

CHRISTOPHER D. MOORE

Bethel University

In the study of comparative politics and international relations, few phenomena are quite as mysterious as the *coup d'état*. In many countries, coups are a regular and even frequent source of regime change. Coups can be observed nearly every year all around the world, and there is a large and diverse body of coups, successful and unsuccessful, for scholars to study. Yet fundamental questions about coups persist. In a revolution, we can observe mass social movements of people seeking change. In legal regime changes, whether hereditary or democratic, we can observe a process that is frequently clear and usually public that guides the transition of power from one government to the next. This clarity is absent in most coups d'état. This is problematic for both scholars and political leaders. Scholars want to understand coups in order to grasp the overall picture of regime change in international politics. Political leaders need to understand coups as they are likely to encounter this sudden and unpredictable change in government, possibly even their own.

In an effort to explore this puzzling phenomenon, numerous scholars have attempted to explain the nature, causes, and consequences of coups. This chapter first defines and characterizes coups d'état. Next, it discusses the main factors thought to cause coups to emerge. Third, it examines the consequences of coups, both within the state and for other interested countries. A necessary component of this examination is a discussion of how states seek to

prevent coups from occurring. Last, this chapter suggests some directions for future research on coups d'état.

The Nature and Causes of Coups d'État

What is a coup? Like many terms in the study of international politics, the term *coup* has entered our popular lexicon. Coups have come to refer to any action that is characterized as sudden, decisive, dramatic, and usually highly successful. As we shall see, some of these characteristics, though certainly not all, typify coups d'état. The word *coup* is of French origin and means *stroke* or *blow*. Therefore, a coup d'état is literally a "blow of state" or, more idiomatically, a blow aimed at or against a state. However, this tells us little about the nature of coups and what distinguishes coups d'état from other forms of regime change, especially their close cousin, the revolution. The first task of this section, therefore, is to provide a definition of coups d'état.

Definition of Coups d'État

Broadly, a coup d'état is a form of regime change. When coups are successful, a new or at least partially new government supplants the prior power structure. Coups are similar in this way to all other forms of regime change, from democratic elections to mass revolutions. There are,

however, key differences that distinguish coups from other types of regime change. These key differences are discussed below.

Extralegal or Illegal Transfer of Power

Perhaps most obviously, a coup d'état is not a legal transfer of power. If a transfer of power occurs according to some legislative action or constitutional directive, a coup has not taken place. It is tempting to say that coups are irregular or abnormal transfers of power. However, coups happen so regularly and repeatedly in some countries that this is not a useful way of understanding coups d'état. Furthermore, notions of irregularity or abnormality create a status quo bias in our understanding of coups d'état. Coups may or may not lead to better governance for their people, but by treating them as irregular or abnormal transitions of power, we give undue benefit to the leadership previously in power. Therefore, it is useful to think of coups as regime changes occurring outside of any stated or previously agreed-on transfer of power.

The Noncritical Role of Violence

In comparison with other forms of regime change, coups d'état do not necessarily rely on violence or the threat of violence to affect the transition of power to a new government. This notion may initially seem counterintuitive, but once understood, it helps to clearly differentiate coups d'état from other forms of regime change. In a revolution, the government is expelled from power by direct violence or threat of violence. In a coup d'état, the government loses power because an elite faction is able to use its resources to acquire a preponderance of power in government without significant violence or coercion.

In casual discussions of the topic, the term *bloodless coup* has become popular. This term is illustrative of the general nature of coups, even if the literal application of the term is misleading. Coups are most successful when the least amount of physical violence or threat of violence must be marshaled. This is because coups leverage the already existing power of the cooperating elites to wrest control of the full political apparatus for themselves. Consider the prototypical example of a military coup. A group of generals grows dissatisfied with the way the civilian government is prosecuting a war. Rather than develop a revolutionary force to fight the government, the generals use their governmentally vested power to command their soldiers to surround the capital for the purposes of protecting it. Now, with their power well displayed, the generals can assert authority over the civilian leadership in the capital. If the coup is optimally successful, the civilian leadership will turn its power over to the generals. If the generals encounter resistance, publicly arresting or executing a few resisters demonstrates both power and restraint. Resistance can be crushed with a minimum number of casualties. This

is clearly a different political process from mass revolution, which often leads to substantial casualties (Leiden & Schmitt, 1968). Therefore, it is clear that coups d'état reflect a type of regime change in which the importance of violence is tangential at most.

The Inconsequential Nature of Popular Will

In the modern world, most regime change occurs as the result of some form of popular will. In the case of democratic elections, an electorate of citizens or subjects selects its new leadership. Popular will also matters in revolutions and civil wars. In civil wars, the people will tend to back a new government when it meets their ideological interests (because it is fighting for causes they support) or because they believe it is in their material interest to do so. That is, they believe that the new government is better able to provide for their security or that their support will mitigate punitive action from the new government. Either way, public support helps secure the transition of governing power after a civil war has concluded.

In the case of revolutions, popular will is even more directly involved. Popular will is a basic requirement for a popular uprising, and whether the uprising gains sufficient strength to depose the current government depends largely on the extent of the popular will supporting it. Social movements seek policy change, and when the favored policy change can best be accomplished through regime change, that social movement becomes revolutionary in character. Therefore, the popular will of the movement empowers the revolution. Without popular support, the revolution will fail.

This requirement is not at all necessary for coups d'état. Coups d'état regularly seem to occur without any consideration of popular will. One important scholar of coups, Edward Luttwak (1979), affirms this characteristic of coups in his seminal work, *Coup d'Etat, a Practical Handbook*. For a coup to be successful, Luttwak believes, the smallest number of functionaries needed to seize the reins of power is the preferred coalition. In fact, the coup is frequently a tool of those looking to contradict the popular will in the case of a democratic election. Whether Luttwak's notion is correct or not, it is clear that the coup d'état is fundamentally an elite phenomenon rather than a product of popular will. The elites who most often seem to be involved in coups are governmental actors, military actors, and economic leaders (Jackman, 1976). As discussed below, the coup's elite character serves as a key in both predicting the occurrence of coups d'état and designing state policies to prevent them.

It should be noted that just because coups originate from small groups of elite individuals, popular support is not perpetually irrelevant. A coup can seize power, but once it begins to govern, its continued success depends on popular support. Coups that fail to capture popular support typically fail (Luttwak, 1979). This may also help to explain why the

presence of a coup is one of the most powerful predictors of subsequent coups, a factor also discussed below (Bueno de Mesquita, Siverson, & Woller, 1992).

Affirmation of Social and Institutional Structures

Some authors have argued that coups d'état fall within a category of political phenomena known as *elite political instability* (Fosu, 2002). This term seems to suggest that coups are destabilizing to a social system. In effect, this is true. Coups, and especially repeated coups, do seem to negatively affect economic growth. However, it is more important to note that the intended effect of a coup is not to destabilize the social or political institutional structures of a society. This sets the coup d'état apart from other forms of social movements or revolutions (Gurr, 1970; Kousis & Tilly, 2005; Tilly, 1978; Tilly & Tarrow, 2007).

Consider the brief example above of the military coup deposing a civilian government. The generals have no interest of invalidating their own authorization to command their troops. Doing so would undermine their own power. The last thing the instigators of a coup d'état would like to do is fundamentally upset the current social order, because they are elites in it. Rather, their interest is in emphasizing social and political institutions that allow them to claim power. In this way, coups are by nature more conservative than other forms of regime change. This helps us understand why some coups come to power promising policy change whereas others come to power promising to prevent policy change. The coup is not necessarily progressive or reactionary but rather a lateral transfer of power within the existing power structure of a society.

Types of Coups d'État

The four criteria discussed above form the groundwork for a definition of the coup d'état:

A coup d'état is an extralegal transfer of power that affirms traditional social and political power structures and occurs without major contributions from violence or popular will.

However, within this definition, there is still a great deal of room for different types of coups. The differences tend to revolve around the nature of the participants in the coup and their proximate objectives. For example, many scholars distinguish coups that originate through civilian forces from those that originate within a state's military. The military's role in the coup d'état is studied more frequently than any other portion of the state apparatus (First, 1970; Jackman, 1976; Jackman, O'Kane, Johnson, McGowan, & Slater, 1986).

This distinction is further subdivided by Samuel Huntington, who describes three types of military coups (Huntington, 1968). Huntington (1968) describes a *guardian coup*, which seeks to replace ineffective governance with effective governance. This coup fits the military

generals' actions described above. In contrast, a *break through coup* is attempted by junior officers and seeks to undermine the military hierarchy, using civilian power to validate the transition of power. Finally, a *veto coup* is used by the military to prevent action taken by the civilian government against the interests of the civilian military. Other authors add additional types of coups, including the *self coup*, in which a government attempts to seize additional powers for itself. This conception of coup is problematic because if the legality of the power seizure is contested, the coup can merely be considered part of politics as usual.

The Causes of Coups d'État

Now that a definition of coups d'état has been established, we can turn to the pressing issue of causality. Like many political phenomena, the incidence of coups d'état appears to be multicausal. This section will briefly describe some of the causes of coups and conclude by evaluating their relative importance in the general phenomenon of coup origins. For conceptual clarity, the proposed causes of coups are subdivided into acute and chronic conditions. These categories are not unproblematic, but they reflect the notion that some proposed causes are proximate to the origin of the coups, while others are societal conditions that set the stage for a coup to emerge. These terms are used instead of direct and indirect causes of coups in an attempt to demonstrate that all the proposed variables are seen as probabilistic, rather than deterministic, causes of coups.

Acute Causes of Coups d'État

Many proposed causes of coups are acute, in that they occur proximate to the origins of the coup itself and might be seen as part of the process that directly leads to the coup itself. A number of these causes stem from factors within the military. Eric Nordlinger (1977) discusses the role of grievances within the military as a source of willingness to challenge the civilian government. These grievances may be particularly strong if they combine structural grievances with heightened personal grievances on the part of specific military leaders. Others consider the role of military popularity in the eyes of the public. Higher popularity may tempt elements within the military to seize power.

In addition to military causes, other domestic causes yield logical links to the emergence of coups. Luttwak (1979) points to domestic political crises as a window of opportunity for the emergence of a coup. These political crises could be constitutional, economic, or even electoral in nature.

Other acute causes of coups are generated from external sources. Michael Desch (1999) argues that military threats from abroad can create opportunities for coup instigators to obtain power, promising to ward off external threats. Bruce Bueno de Mesquita et al. (1992) find that military defeat and participation in war raise the likelihood of a coup. Finally, direct foreign intervention may increase the likelihood of a coup d'état. According to one study,

approximately 10% of all coups d'état involve the participation of a foreign power (David, 1987). There is no simple relationship to this involvement. In some cases, it appears that foreign involvement is the original cause of the coup attempt. This is typified in Operation Ajax, a U.S. effort that led to the deposition of Mohammed Mosaddeq in Iran in 1953. In other cases, coup instigators reach out to foreign powers in an attempt to gain additional power and leverage to apply domestically. The 1965 military coup that seized power in Algeria appears to have done this by reaching out to other regional powers in Africa (Quandt, 1969).

Chronic Causes of Coups d'État

There are numerous structural and institutional factors associated with the emergence of coups d'état. Aaron Belkin and Evan Schofer (2003) have developed a structural model of coup risk, which serves as a very useful overview. The first set of factors revolves around the material or structural factors of the state in question. First, what is the character of the economy of the state? If a state's export economy is particularly monolithic, this factor will hypothetically raise the likelihood of a coup. If a single industry or export is particularly powerful or influential, then controlling the management of that industry would be critical to capturing the power of the state. Certain types of exports lend themselves to this type of consolidation at the export level. Oil, valuable minerals, timber, and other materials that are of high value and require capital-intensive extraction are particularly vulnerable to this type of coup propensity.

A second structural condition is centralization of wealth (Jackman et al., 1986). This factor is correlated with the notion of a monolithic export economy described above. If wealth is highly centralized, coup risk is hypothetically elevated because the coalition of wealthy elites necessary to cause a coup is considerably smaller. An egalitarian distribution of wealth should have the effect of decreasing the likelihood of a coup d'état.

In addition to economic variables, scholars have considered historical factors that may influence coup propensity. Key among these are the lingering effects of colonialism. Many former colonies have well-developed and well-trained military forces. Often, the level of institutionalization and cohesion in considerably higher in the military than in the civilian government. This was the case in Pakistan when Pervez Musharraf was able to seize power in 1999. Musharraf was able to gain power not only because the military held violent coercive power but because the military was understood to be as legitimate a basis of power as the civilian government of Nawaz Sharif. Colonial powers such as France and Great Britain often emphasized the training of military forces over the establishment of indigenous civilian institutions. This choice may serve to make former colonies more prone to coups. In addition, colonial legacies may affect the full enfranchisement of the citizenry. Huntington (1968) points to this idea in proposing that coups are more likely in societies that limit political

engagement to a subset of their citizenry. Citizens outside the political process may seek a coup as a means of political participation. Note, however, this hypothesis somewhat contradicts the idea that coups are primarily elite driven.

Other historical factors affecting the likelihood of coups d'état are the legitimacy of the regime in power and the strength of civil society. Even if the military or other organs of the state are highly cohesive and institutionalized, if there is a correspondingly strong civil society, coups are much less likely to occur (Jackman, 1978). A strong civil society raises the minimum number of participants necessary to carry out a coup, and if the society is strong enough, the number of necessary coup participants will rise beyond the point of feasibility. Additionally, if the regime in power is seen as legitimate, Nordlinger (1977) argues, a coup will be less likely. Some have argued that this variable is close to tautological as those deposing a regime of course will consider it illegitimate.

A final historical factor that influences the likelihood of a coup is a previous coup. Numerous authors point out that coups often beget additional coups (Bueno de Mesquita et al., 1992). There are several logical ways to explain this empirical finding. First, the presence of a coup may be an indicator of societal conditions that promote the emergence of a coup. Since a coup by nature does not seek to alter societal or institutional power structures, the factors that led to the first coup persist and may allow for additional coups. A second explanation can be called the *political instability pathway*. Because coups by nature are extralegal transfers of power, a coup weakens the legitimacy of social and political institutions. In the same way, then, that a heart attack weakens the muscles of the heart, a coup weakens the institutions of power. This creates windows of opportunity for additional coups. Finally, some authors point out that new regimes are generally less stable than established, institutionalized regimes. Therefore, any time a regime changes, by coup or otherwise, it is more likely to be susceptible to instability, including additional coups (Sanderson, 2005).

What can we learn from these diverse hypothetical causes? Clearly, a portrait of a state ripe for coup d'état is beginning to emerge. Such a state is perhaps a former colony; has a monolithic export economy; exhibits weak governmental legitimacy; and has a weak civil society, a clear economic elite, and a powerful, institutionalized, and cohesive military. When these factors are coupled with military grievances, external threats, or domestic political crises, a coup is likely.

Internal and External Policy Implications of Coups

While political scientists have expended a great deal of effort to define and consider the causes of political and military coups, a growing area of study has been the consequences of coups d'état and the policies that states implement to deal

with the potential for coups both at home and abroad. This section thus deals with three questions. First, what are the consequences of coups d'état? Second, how do states attempt to protect themselves against the onset of a coup, and how successful are these efforts? Third, how do states react to coups in other countries, and what role does this reaction play in their foreign policy?

Consequences of Coups d'État

After a political or military coup d'état has taken place, several effects can be regularly observed. Before we can consider any others, we must turn to the success of the coup. Coups d'état regularly fail. In a study of 16 West African countries from 1955 to 2004, Patrick McGowan (2006) found that the military plotted a coup 169 times. Out of these plots, 87 led to actual coup attempts. Of these attempts, 43 failed and 44 succeeded. So the success rate of a coup depends on when measurement begins. Looking only at coup attempts, we would find that coups succeed about half the time. However, given our theoretical understanding of coups, we would expect the success rate to be quite high because coup instigators would initiate coups only when their chances of success were very high. According to this logic, a 50% success rate is low, assuming that the costs for the instigators are quite high. Alternatively, we could measure coups from the origins of a serious plot. By this measure, coups succeed only a quarter of the time. This seems more appropriate as many coup plotters will be dissuaded by the difficulty of successful execution. This observation raises an important question in the study of coups d'état: Why are coups initiated in the face of such high costs when they fail so frequently? A relevant direction for future research is discussed in the final section of this chapter.

When coups do succeed, we first can observe the steps that the coup instigators undertake to consolidate their power. These steps generally fall into two categories: *institutionalization* and *integration*. The institutionalization step reflects the attempts of the coup instigators to legitimize and normalize their new position as the leadership of the state. The integration step reflects their attempts to buttress their position in leadership by making additional bargains with power centers inside and outside the state in order to prevent their removal. Whereas revolutions and democratically elected governments enter with a mandate of popular will, coup instigators do not enjoy this benefit. As a result, the days immediately following a coup are the most critical for the new leadership. It is in this time that the new leaders are most susceptible to a countercoup or other action that will remove them from power.

Coup instigators begin to institutionalize their leadership through interaction with elites and the general populace. The new leadership often makes use of its current sources of power and attempts to spread that legitimacy throughout the society (Leiden & Schmitt, 1968). For example, when Musharraf seized power in Pakistan, his chief source of power was the Pakistani military he controlled. Because the

military of Pakistan is highly institutionalized, deeply professionalized, and politically active, Musharraf was able to use this position to convey a sense of legitimacy to both the Pakistani populace and other Pakistani elites. Often accompanying this portrayal of legitimacy is a set of promises or other forms of political framing to communicate a justifying narrative for the seizure of power. For example, the new leaders may claim that they seized power to end the corruption of the prior regime. They may also seize power to restore the state to greatness, to prevent calamity, to end oppression, or for other noble causes. Several prominent scholars refer to these promises as the coup's *pronouncements* (Luttwak, 1979; Nordlinger, 1977). Whether anyone deeply believes these tales may not be important. So long as the new leadership is able to prevent a countercoup, its pronouncements become part of the political narrative.

Coup instigators also work to integrate their power throughout the state they have seized. While the institutionalization step might be dismissed by some as mere political theater, the integration step is clearly crucial to the short-term success of any coup. When a coup succeeds, by definition a small number of individuals place themselves at the top of the governance structure. For their effort to be successful, they must link themselves fully to the traditional reins of power in the government and society. A helpful analogy is to think of a heart transplant. In the days and months following a heart transplant, recipients must typically take medication designed to prevent the body from rejecting the new organ. The new leadership must initiate a similar process after a coup. The leadership must reach out to other leaders, social institutions, industries, and other sources of power and convince them that they can trust the new government and may even find it advantageous. This behavior takes the form of reassurance, deal making, and incorporation. The ideal, for the coup instigators, would be to reassure these power sources in society that the new government would not dramatically alter the status quo. Often, this coincides with the coup's political rhetoric: The coup itself may be promising to return the society to a previously understood status quo. However, when powerful players in a country's domestic politics cannot be reassured, the new leaders may offer deals. Deals can take the form of increased political power or autonomy for cooperation with the new regime. This form of deal making can lead to the final option of the new leadership, *inclusion*. In order to bolster its own power after a coup, the new leadership may be forced to invite other power brokers from the society into the new government. Obviously, this is not advantageous for the coup instigators, and it may ultimately lead them to be more susceptible to a secondary coup by the very powers they are forced to include by necessity in their new government.

"Coup-Proofing" and Other Internal State Policies

When we consider the causes of coups d'état, we are immediately presented with a list of hypotheses for the

prevention of coups. However, most literature on the prevention of coups has focused on two topics: the limited number of structural conditions that generally protect states from coup-type instability and the broader set of conscious policies some states undertake to reduce or eliminate the likelihood of future coups in their country.

First, a substantial number of studies have emerged out of political economy to test what structural factors ward off the emergence of a coup. In seeking to understand coup risk, many of these studies grapple with Huntington's (1957, 1962) contention that modernity is the best defense against a coup, but that modernization is a great risk for political instability. If this is true, is it also true that less developed states, those likely to be susceptible to a coup, are unable to move into a low-risk environment without jeopardizing their own political stability? According to John Londregan and Keith Poole (1990), not exactly. Testing a large set of countries' economic and political behavior from 1950 to 1982, Londregan and Poole find several results that confirm the causes of coups mentioned above. Particularly potent among these causes are the existence of a prior coup and poverty within a country. However, Londregan and Poole also find that not only is a higher rate of societal wealth a powerful inhibitor of future coups, but economic growth is also a surprisingly effective coup preventative. In this respect, studies of development tend to disagree with Huntington; economic modernization does not necessarily lead to a coup as long as societal income is increasing (Jackman et al., 1986). This suggests that all types of governments, including authoritarian governments or those seizing power via a coup d'état, should have an interest in promoting economic development as a means of insulating themselves against a future coup.

In fact, states will go to great lengths to prevent coups. Not surprisingly, states that have suffered coups or whose governments came to power as the result of a coup d'état often exhibit the most conscious policies that attempt to shield the state against future coups. When the government of a state cannot count on economic development as a means to protect itself against a future coup, it may adopt several types of policies, which can be organized into categories of redundancy, surveillance, loyalty, and proper funding. These concepts are well summarized and illustrated in several recent works, notably that of James Quinlivan (1999).

Redundancy

One of the chief weapons of all states against a coup is redundancy. Because coups come to power by seizing control of a critical aspect of the state apparatus, one means of guarding against this is to create multiple versions of state institutions. Most often, this behavior is seen in the military of a state and the state's intelligence services. First, many states, and particularly states with reason to fear future coups, will create multiple militaries with parallel hierarchies. This is particularly true in authoritarian governments.

In Saddam Hussein's Iraq, the Revolutionary Guard served as a separate, parallel military hierarchy to the normal Iraqi army. The creation of the Revolutionary Guard helped to insulate Saddam's Baathist regime against potential coups from the regular military apparatus. At the same time, the regular military served as a check against coups emanating from the Revolutionary Guard.

States often also employ redundancy in their intelligence services. Because intelligence services by nature work with restricted information and clandestine policies, they are often breeding grounds for coups d'état as a form of regime change. A prime means of preventing this is the creation of multiple intelligence agencies, whose mission in part includes spying on each other. By positioning itself as the sole arbiter between warring intelligence services, the leadership of the state assures itself that it holds the most complete intelligence picture and that its intelligence services are too busy with turf battles to challenge its leadership.

Surveillance

A second powerful policy of coup-proofing is surveillance. While intelligence services regularly gather information on subversive groups within a state, surveillance speaks to a broader sense of scrutiny that inhibits the emergence of coups. Here, the analogy of Jeremy Bentham's *panopticon* is useful. According to Bentham, the panopticon was a prison with a sphere of cells surrounding a single watchtower, whose guard the prisoners could not see. Because prisoners could always potentially be observed, and because they could never know whether they were actually being observed, Bentham believed that their behavior would be scrupulous. If the powerful members of a society function in an environment where trust is low and there is an ongoing belief in their continued surveillance of each other, the opportunities for forming a successful coup coalition are very few. Some leaders, through public trials of corruption or treason, will demonstrate that the society or at least the government is vigilant against threats. As long as the perception within society is one of general vigilance and relatively low trust, many potential coup conspiracies can be dissuaded, even if they were unlikely to be detected in the first place.

Loyalty

A third and very powerful tool of coup-proofing is to rely on previously existing forms of loyalty. In many societies fearful of political instability, there are often deep ethnic or religious cleavages. Governmental leaders will capitalize on these social cleavages as a means of insulating themselves from threats of a coup d'état. By promoting members of their own religious sect or ethnic group into positions of power throughout the society, the governmental leaders are assured that challenges to their authority are reduced. A coup that displaces them would also displace the leadership of other power centers in the society. This means

that a coup has fewer places to generate from in the first place. Quinlivan (1999) points to this type of ethnic and religious networking in such supposedly coup-proof states as Saudi Arabia, Syria, and Saddam Hussein's Iraq.

Funding and Appeasement

As was stated above, economic development and income growth are powerful inhibitors of coups d'état. However, not every state continuously experiences such prosperity. When income is not growing in a society or economic development is not occurring, the leadership of the state may worry that the risk of a coup is increased. When this is the case, one of the most direct responses that a state can take is to ensure that those it supports financially do not challenge its authority. This means that the state must make certain that elements within the state apparatus are economically satisfied. If the state fears that a coup might originate from the military, the risk of such a coup is reduced if the military is well paid and well compensated (Byman, 2006). When the vast majority of individuals within an organization are individually satisfied, the pool of potential coup conspirators is very shallow. This observation also serves as a corollary to the idea described above that disastrous foreign conflicts could be a source of potential coups. When the military is insufficiently compensated or is losing a war, its dissatisfaction may raise the risk of a coup. Therefore, keeping critical organs of the state satisfied will help ward off the onset of a coup.

Foreign Policy Responses to External Coups

There are two general approaches to considering the foreign policy implications of coups. The first approach is to suggest that because coups are deeply idiosyncratic, foreign reactions to coups will be highly varied, with very little predictability from coup to coup. While it is certainly true that each coup is unique in its full range of participants, execution, and consequences, arguing that there are no systematic reactions to coups d'état is also misleading. Therefore, this section presents the broad but observable foreign policy reactions that coups d'état elicit from other states. These responses can generally be further subdivided into foreign policy responses toward the coup state and foreign policy responses because of the coup itself.

Responses Directed Toward the Coup State

When states react to a coup d'état within another state, two factors seem to predominantly affect the response. The first factor is domestic politics within the state. Democratic states usually respond negatively to coups that subvert the democratic will of another people. This has been aptly illustrated in the U.S. reaction to the recent military coup in Honduras. Much of the intransigence of the U.S. reaction can be explained by noting that it is not clear who is defending the democracy of Honduras. Is it Manuel

Zelaya, the democratically elected leader who was deposed by military forces? On the other hand, were the military forces seeking to preserve democracy from Zelaya, who appeared to be looking to extend his rule through constitutional manipulation? It seems that should the United States have been able to arrive at a decisive answer to this question, it might have adopted a position in favor of one side or the other. However, as of this writing, the United States continues to push for compromise between Zelaya and the military, suggesting that it sees democratic intentions on both sides of the contest.

Ideology also played a major role in external coup support or opposition during the cold war. Numerous examples of coups engendered by the United States and the Soviet Union in third-party countries suggest that the superpowers were not only willing to support military and civilian coups d'état to obtain more favorable state leadership but also to help create these coups. Particularly instructive on the U.S. side are the cases of Guatemala and Chile (Cullather, 2006; Linz & Stepan, 1978; Westad, 2007). In these cases, the United States went against democratic inclinations to support coups d'état that replaced governments that looked as if they might favor the Soviet Union.

Ethnic motivations may also play a role in responses to coups d'état. When the coup is executed by forces characterized by shared ethnicity, Donald Horowitz (1985, 2001) finds, we can expect that the coup's leaders will receive support not only from domestic ethnic compatriots but also from international kinsmen. Horowitz also describes a *seesaw coup*, whereby different ethnic groups struggle for control of a country through coups and countercoups, with each side receiving external as well as internal ethnic support.

Generally, when a state opposes a coup in another country, whether for ethnic or for ideological reasons, the typical response is to sever diplomatic ties with the new government and to refuse to recognize its legitimacy. If the new government can survive, its survival raises problems for the opposed state. At what point will the opposed state reengage with the government? Often, democratic countries tie their reengagement to some form of democratic activity. For example, if the new government promises or delivers democratic elections, this strategy serves as an avenue toward rapprochement. On the other hand, when a foreign government favors a coup d'état, it is often complicit in the institutionalization and integration project of the new government. It is in the foreign government's interest to legitimize the new, coup-installed government as quickly as possible.

Responses Stemming From the Coup Itself

Although most of the observable foreign policy of states in reaction to a coup d'état are directed toward the coup itself, one particular form of reaction is directed internally. This chapter has already discussed the extent to

which a previous coup raises the likelihood of a future coup. Richard Li and William Thompson (1975) find that states also react in ways that suggest that they worry that a coup in a proximate country might raise the risk of a coup in their own country. Li and Thompson find that in fact the presence of a coup in a nearby country does elevate the risk of coup in one's own country. They conclude that this process is a result of reinforcement, whereby coup instigators are emboldened by coups occurring in other, nearby countries. As a consequence, many states that witness nearby coups often are more likely to adopt coup-proofing behaviors of the types described above. It is also possible, although presently untested, that coup contagion is actually a product of self-fulfilling prophecy. When a state reacts to a nearby coup with coup-proofing policies, the inception of these policies themselves may actually increase the likelihood of a coup d'état.

Future Directions for the Study of Coups d'État

The systematic study of coups d'état has, unfortunately, given way in recent years to investigations of other types of regime change. Part of the space often given to the study of military and political coups has been overtaken by a renewed interest in terrorism and complex insurgencies. This change in scholarly pursuits may reflect generational preferences, or it may reflect the changing nature of international politics. The dust of the third great wave of democratization has settled, and there is no longer a cold war to impel some coups forward. However, even a casual accounting of recent coups suggests that coups d'état remain an important and relevant phenomenon of international politics. It is important that recent authors have also demonstrated that the risk of a coup can dramatically influence multinational foreign policy. Daniel Byman (2006) has argued that a coup in a country such as Saudi Arabia, Pakistan, or Egypt could dramatically inhibit U.S. efforts to fight al Qaeda in the Middle East. The study of coups remains important, and the importance will grow as scholars turn to answer the following questions.

First, is there a simple definition of coup success? There remains substantial disagreement within scholarship on coups d'état on the critical factors determining coup success. Some argue that the critical factor is the execution of the coup. If a coup succeeds in supplanting the previous government, then the coup is considered successful (Luttwak, 1979; Nordlinger, 1977). In contrast, coups are politically successful only if the coup instigators remain in power long enough to develop rudimentary institutionalization and integration and subsequently exercise power. This cannot really happen in the early days of a coup, but how long must a coup endure before it is considered successful?

Second, are coups discrete phenomena or contextual events? Many large quantitative studies of coups d'état treat them as discrete phenomena. In some ways, there is

much to recommend this choice. It suits the data requirements of statistical studies. Coups are clandestine and focused on a small group of instigators, so they appear to emerge from nowhere. However, this chapter has detailed a number of ways that coups affect and are affected by structural and historical conditions. The context of the coup matters, and this context is well treated by the idiographic historical studies of coups. Unfortunately, too many histories of coups treat them as idiosyncratic, with no knowledge to be gained by a comparative study of coups d'état. It seems that future studies of coups must learn from both these perspectives. Future studies need to take great account of the social and historical factors influencing coups while at the same time seeking a nomothetic, comparative understanding of coups as a social phenomenon.

Third, what is the normative place of coups? The scholarship on military and political coups d'état has rarely stopped to consider the ethical questions associated with a nondemocratic regime change. Future research should examine the normative implications of coups. While coups are attempted with a variety of intentions, do these intentions matter? If a military coup seeks to save the country or prevent broader pain to its people, do these motives make a coup acceptable? A second line of normative questioning relates to violence. No coup is truly bloodless, in the sense that someone must be coerced out of power. However, some modern coups seem to be nearly bloodless. Does this matter normatively? Should it change how foreign states ought to respond to the coup? A final consideration is the role of popular will. What if, as may have been the case in Honduras, a coup is reflective of popular public opinion? Does that factor justify the use of extralegal, nondemocratic means to seize power? Future research should consider these questions and integrate them into a comparative analysis of coups d'état.

A fourth and final set of questions is methodological. What theoretical approaches and methodological tools wait to be applied to the study of coups? One theoretical approach that has not yet been applied to the study of coups d'état is *political psychology*. Political psychology can add to our understanding of coups d'état by helping future scholars theorize when coups d'état are accepted, the role of perception and framing for the legitimacy of the coup instigators, and the role of risk propensity in initiating a coup. For example, could the extensive work on decision making under conditions of risk help future scholars understand why some coups are initiated and others are not (Farnham, 1994; McDermott, 1998)? A second theoretical approach is the voluminous and continually growing social movement literature. Although many classic studies of coups d'état make use of social movement literature, important advancements, both theoretical and methodological, can be applied to the study of coups (Davis, 2005; Tilly & Tarrow, 2007). In addition to new theoretical directions, there are opportunities for new methodological directions in the study of coups. Rather than relying on large sample, quantitative studies or historical case studies, the

phenomenon of coups could be studied through the use of *process tracing*. As opposed to correlation, which is the main finding of statistical studies, process tracing seeks to use nuanced historical data to test hypotheses within a single case. Combining this method with a quantitative study could yield more insightful results. A second fruitful methodological path is to employ computer simulations of regime change. Recent advances in computer simulation software allow for increasingly complex forms of behavior to be modeled and iterated in a game-theoretic context. This methodology would be a useful way to further test hypotheses in areas such as coup-proofing and coup contagion.

Conclusion

This chapter has sought to explain the state of scholarship on political and military coups d'état. Coups are an extralegal transfer of power that affirms traditional social and political power structures and occurs without major contributions from violence or popular will. Among acute causes of coups, foreign intervention and military defeat help explain the emergence of coups. Among chronic causes, the most powerful predictor is the presence of a prior coup, although economic and political factors change coup risk propensity. Certain policies tend to follow coups as the new regime seeks to consolidate its power. Other policies seek to prevent future coups through a process known as coup-proofing. There are unanswered questions, untapped theoretical traditions, and underused methodological traditions that will keep the study of coups rich and productive for years to come.

RESOURCE SCARCITY AND POLITICAL CONFLICT

WALTER THOMAS CASEY II

University of Texas at Dallas

“Destroy the thrones of the wicked. . . .”¹

The popular press is rife with economists, ecologists, and religious doomsayers seeking to explain, predict, and profit from the problem of resource scarcity and its twin, resource allocation. Closely following are an increasing number of scholarly forays in economics, anthropology, geography, and political science.

The modern scholarship’s groundwork may be said to properly begin with Malthus’s *Essay on the Principle of Population* (1798). Therein, he in part argues that given finite resources, and an infinitely expanding population, political, social, and spiritual turmoil is inevitable. The flurry of activity the publication of that essay created has been ever present, so that subsequent generations of popular writers (e.g., Charles Dickens and others) were able to tap into the broader theme. Thus by the late 1800s, social-ist theorists were able to exploit Malthusian ideas as a means of broadcasting the desirability (or, following Marx, the inevitability) of democratic equality.

Neo-Malthusian conservationists such as Harry Overstreet (1915), Thomas Carver (1915), and Richard Ely (1916) reexamined the previous centuries’ analyses and added their own Edwardian twist—the need to conserve resources for “civilized” peoples. Yet for all their

scholarly attempts, the conclusions were proscriptive rather than prescriptive and more than a bit race based.

It was not until the 1920s that deeper analyses were conducted and prescriptions for policymakers proffered. These Wilsonian internationalists stressed the need for necessary resources such as food, water, and fuel to be distributed or redistributed according to need rather than according to profits. More vocal academics, such as Powers in his 1928 *International Institutions: Formal Mechanisms for Dealing With Resource Conflicts*, was but one among many who saw the necessity of supranational actors as arbiters of dispute.

The economic crisis of the 1930s saw more and more attempts to move policy actors to embrace anticonflict measures of resource problems (Barnes & Field, 1933; Burns, 1934). Many saw within Hitler’s demand for *lebensraum* one country’s rather nakedly pragmatic attempt at a chauvinistic redress of conflict scarcity and were appalled by the possibility of such a tactic being embraced by similar actors elsewhere (Speier, 1939; Spengler, 1937). World War II was to make those fears realized.

During the cold war era, academic attempts to be prescriptive about solving political conflicts over resource

scarcity either veered into ideological territory by asserting the necessity of the “free world” to triumph over the forces of communism² or were besmirched with the label of communism,³ as Galtung’s (1965) work was so tagged. This retarded the progress made earlier, and it was not until the later 1960s and 1970s, as researchers became more interdisciplinary and reached out to the physical and life sciences, that scholarship began to move forward again. Richard Cooper’s (1973) foray still stands as a paragon of this type of research.

Cooper’s now classic work on the economic anthropology and settlement patterns of the Hmong in northern Thailand was a breakthrough. By establishing how the production of opium in highland family units and the fights over such production affected them, Cooper melded anthropology, environmental science, and sociology in a much admired and much copied recipe for the study of resource allocation and policy reactions to potential conflicts. The weakness, of course, is in inferring generalizations from the individual level to larger actors. But nonetheless, it was a grand experiment in its observation of actualities, rather than an ivory tower research exercise. With Cooper’s research, resource allocations become more personal and more pointed, and hit closer to home.

Once research put a human face on the various aspects of resource scarcity and conflict, attempts to generalize became more possible because numerous field studies became less anecdotal as they were gathered together and compiled and became more empirical as they became data. Not all data are created equal, and many of the individual biases of the researchers remain in some of that gathered materiel. But data-gathering techniques have improved and become more uniform, and coding has proceeded apace. Thus anthropology, sociology, physical science, life science, geography, economics, and statistics come together in modern political science analyses.

The current state of scholarship can be best understood as a multidisciplinary effort, with political science having wrested much control of the discourse from other disciplines, due in no small part to the ability to meld, merge, and synthesize, as well as to create, novel empirical explorations. The following discussion attempts to thematically display the current state of scholarship.

The Current State of Research

Much of the literature rests on pure physical resource scarcity and allocation. This body of work assumes, predicated on historical events, that resources are finite or near finite and that one entity’s possessing an amount of a resource necessarily denies access, production, or use of that resource to another entity.⁴

Ross’s (2004) review of cross-national econometric and qualitative studies of scarcity and conflict concludes that

collectively, most prior work can be grouped according to its conclusory assumptions:

1. Oil increases the likelihood of conflict, particularly separatist conflict.
2. “Lootable” commodities such as gemstones and drugs do *not* make conflict more likely to begin but do prolong existing conflicts.
3. There is no apparent link between agricultural commodities and civil war.
4. The association between primary commodities, which include both oil and agricultural goods, and the onset of conflict is not robust.

Ross suggests that the inconsistencies among studies may be caused by differences in the ways researchers code civil wars and cope with missing data. His conclusion is all the more interesting given the problems inherent in qualitative studies that have been well documented along these lines. His conclusion thus seemingly implies the need for more rigor in empirical work and better cross-study coder reliability and pasigraphization of definitions and terms.

Finding little support for almost all empirical assessments, however, is the work of Urdal (2005). Noting that neo-Malthusians’ assertion that population pressure on natural renewable resources makes societies more prone to low-intensity civil war enjoys little support, he goes on to demonstrate that “resource-optimists’” assumption that agricultural land scarcity caused by increasing population density drives economic development, in turn driving peace, is unfounded as well. He tests both in a time-series cross section from 1950 to 2000, with results for either being tepid, at best, or counterfactual.

Countries experiencing high rates of population growth, high rates of urbanization, or large refugee populations do not face greater risks of internal armed conflict than other countries do. There is some indication that scarcity of potential cropland may have a pacifying effect.

However, where land scarcity combines with high rates of population growth, the risk of armed conflict increases somewhat. . . . Overall, the robustness of the empirical support for both paradigms is low. A strong emphasis on security as a macro rationale for reducing global population growth thus seems unwarranted. (Urdal, 2005, p. 417, italics added)

Becsi and Lahiri (2007) examine scarcity and conflict via a simple *trade theoretic model* (two regions in conflict, war equilibrium determined endogenously). Their finding is that an abundance of uncontested natural resources discourages conflict (a more even ratio) and an abundance of contested natural resources encourages conflict. They also note that when entities (regions) possess power to affect the terms of trade, and use that power, the effect of ownership on conflict “may be strengthened or weakened depending on factor intensities

of production and the relative strength of income and substitution effects” (p. 17).

Le Billon analyzes the vulnerability of resource-dependent countries, concludes that long-term stability in resource-exporting regions is dependent on their levels of development, and calls for a broad reform agenda prioritizing the basic needs and security of local populations. Similarly, Bannon and Collier (2003) find that the entities (in this case, nations) most likely to be affected by conflict are those whose economies depend mostly on natural resources, a phenomenon they term *resource dependence conflict*.

Bogalea, Taebb, and Endoc (2006) use multinomial discrete choice models to identify determinants of household choice among alternative land property right regimes and whether those rights help mitigate negative consequences of scarcity-induced land-related conflicts. They assert that two factors, dependency ratio (i.e., that proportion of a population composed of dependents, or people who are too young or too old to work. The dependency ratio is equal to the number of individuals younger than 15 or older than 64, divided by the number of individuals aged 15 to 64, expressed as a percentage) and level of education, produce the most predictive power, whether or not the household prefers a common property resource regime. Conversely, the variables *number of household members*, *livestock holding of the household*, and *area of cultivated land lost due to enclosure* were found to be more relevant in determining a preference for resettlement. Such a study assists the researcher in determining model framework and methodological choice, especially given the personal nature such discrete choices entail.

Lujala, Gleditsch, and Gilmore (2005), in examining “lootable resources” (here, diamonds), offer a competing model along similarly strong methodological lines. While territory, oil, and water are most often mentioned as the type of contestable resources likely to lead to conflict, diamonds have emerged in recent literature as a prominent factor. The authors find a strong bivariate relationship between diamonds (particularly secondary diamonds) and the onset of conflict, but adding diamond dummies to standard models produces less robust conclusions. The secondary–primary distinction is important because production of secondary diamonds increases the risk of ethnic conflict, but not other types, whereas primary diamonds make ethnic conflict less likely. Most intriguing is that the impact of diamonds has been substantially stronger in the post–cold war era, suggesting a tantalizing ideology–resource link.

Klare (2002) broadens the single-item resource paradigm to a more widely encompassing one. As the complexities of rapidly increasing demand of globalizing industrialization continue, the concentration of resources in unstable states and the competing claims to ownership of resources by neighboring states predict a greater likelihood of conflict. Examples include the potential for conflict

over oil in the Persian Gulf and in the Caspian and South China Seas; over water in the Nile Basin and other multinational river systems; and over timber, gems, and minerals from Borneo to Sierra Leone. Klare’s analyses of likely conflicts are informed by detailed research into projected usage rates, population growth, and other relevant trends that show such to affect the likelihood of conflict: a pattern repeated throughout the world.

The discourse on diamonds points up not only the break from primary resources to produced or manufactured resources but the ecological effect such production has as well. Joseph Stiglitz’s works (e.g., his 2002 *Globalization and Its Discontents*) have been a lodestone for those examining production and manufacture as a source of conflict. In contrast with earlier studies focusing on fuel, mineral, and agricultural resources and the efficiency by which they are allocated, the concern Stiglitz examines is similar to that of the climate-change scholars, in that he also includes the environmental consequences of resource extraction and use.

A New Variable: Climate Change

This new debate, that of human activity—particularly industrialization and its attendant problems—causing global climate change, is notable because an increasing number of players in this discursus have argued that climate change will lead to resource competition, mass migration, and, ultimately, an increase in armed conflict around the world. Salehyan (2008) takes issue with such “determinism.” He posits instead that the effect of climate change on armed conflict interacts with a number of political and social variables. Ignoring interaction effects results in spurious correlations and problematic predictions about when and where conflict is likely. He offers the assiduous scholar a research program predicated on more rigorous and sophisticated methodologies than the comparative case study.⁵ *Biocapacity* (a measure of how biologically productive land is) and *ecological reserve* (a measure of the amount of land available for production) are also predictive of peace, but the community of scholars engaged in this research arena cautions such results are less robust. Given the extractive elements necessary for possessing such an *ecological footprint*—which, for all intents and purposes, comprises the old idea of the first world—their critics assert that there exist conflating, interactive, and indirect effects not fully explained.

These interaction effects, which Homer-Dixon (2009) has noted since 1991,⁶ are ameliorated, he says, by the ability of the extractors, producers, and consumers to use “human ingenuity” positively. That said, this enfant terrible of this arena as well is willing to lay fault at the feet of crass corporate and elitist carpetbagging and the social structures of repression, as well as comment on

the role urbanization plays in exacerbating scarcity, as he has done since 1999. He does not, in the end, insist that ingenuity can or will more than partially offset scarcity-related problems, which only reductions in scarcity can do fully.

This finding is similar in vein to what Gausset, Whyte, and Birch-Thomsen (2005) attempt. They deliver an alternative perspective to conflict analysis by building on theories of political ecology that have developed from Marxist geography and cultural anthropology. Such an approach sets aside the neo-Malthusian accounts anchored in population determinism and linear causality. They instead ask for a neo-dialectical approach by focusing on the processes by which natural resources are manipulated by vested interests for assuming power, some arguments of which have been explored previously by Peluso and Watts (2001).

A weakness of the dialectical approach is in not acknowledging that “one of the important contributions of Malthusian and neo-Malthusian models is that they make individual agency central” (Peluso & Watts, 2001, p. 17). Glossing over this aspect of natural resource consumption and carrying capacity are problematic. A more appropriate model, Peluso and Watts (2001) argue, bridges the dialectic with historicity of study. To that end, they develop the concept of *political scarcity*, but this itself tends to neglect the physical constraints of resource availability.

The importance of political models as part of the study of scarcity is one that Nobel laureates such as Amartya Sen and Wangaari Maathai have commented on. But the danger of a political scarcity model is potentially absolving individual consumption patterns and ecological behavior of human societies. Moreover, although the political model approach is commendable, failing to account for material aspects suggests an incomplete model. Bailis (2006) notes the incompleteness of contemporary models, and Reuveny (2008) asserts that if explanation is part of empirical social science, so then is prediction. That is, the effects of climate change on migration can be forecast by exploring the effects of earlier environmental conditions on migration in recent decades. He argues that adaptation, mitigation, and emigration are the three possible human responses, the choice dependent on the extent of problems and mitigation capabilities. People living in lesser developed countries may be more likely to leave affected areas, which may cause conflict in receiving areas.

Stringer et al. (2009) agree but, as with most work in this area, use a regional study to support that theory. While not fully generalizable, their postdictive examination of climate-sensitive development strategies serves to make their foray an observational natural experiment of sorts—itsself very useful. Hendrix and Glaser (2007), examining a wider area (sub-Saharan Africa), contribute further by examining multiple time dimensions, both long-term trends in climate and short-term climatic triggers on civil

conflict onset. They find, similar to the first world operationalization noted earlier, that climate suitable for Eurasian agriculture is associated with a decreased likelihood of conflict, which is concomitant with distribution ratios of freshwater resources per capita being positively associated with the likelihood of conflict. Using simulated data up to 2099, they also predict climate conflict, finding, surprisingly, that there are few statistically significant, positive trends, suggesting the lesser probability of climate change dramatically affecting conflict. That in turn infers a Bayesian, or instantaneous learning and updating process, is at work intraculturally, or even cross-culturally.

Such is contra Martin, Blowers, and Boersema (2006). They begin by noting that conflict is often intratribal, -ethnic, or -religious. But large data sets disconfirm association between a country's social diversity and the likelihood of warfare; rather the converse relationship is more often found: ethnic and religious diversity tends to foster peace, not war. This departs from Crawford and Lipschutz's (1998) *Myth of "Ethnic Conflict."* Martin et al. assume two largely independent dimensions to the study of environmental conflict. The first investigates what has been dubbed the *resource curse*. Resource abundance (especially oil) is viewed as a factor in motivating secessionist movements, whereas a wider range of high-value resources (oil, gold, drugs, coltan, tin, diamonds, timbers) provides a means of financing rebel armies and thus sustaining and escalating already existing violence (Bannon & Collier, 2003). In contrast to concerns about abundance, resource scarcity may be viewed as a possible cause of violence. Scarcity in this context refers mainly to renewable resources such as water, fuelwood, and soil and arises from reduced supply (depletion or degradation), increased demand, increasing inequality of distribution, or a combination of these.

Brown, Hammill, and McLeman (2007) review the linkages between climate change and security in Africa and analyze the role of climate change adaptation policies in future conflict prevention. Ameliorating or adapting to such projections necessitates an accounting of the other variables interacting: existing social, political, and economic tensions.

In terms of indirect effects, Obioha (2008) asks what happens when *climate change* (herein, depressed rainfall) → *scarcity* (herein, crop shortages) → *conflict*? Focusing, as much of the literature does, on sub-Saharan Africa—Nigeria in particular—Obioha investigates the chain of interactions between climate change, population drift and pressure, and conflict over land resources. Thus he is able to use not only the indirect effects model but an admixture of indirect and interaction effects—not only a more sophisticated method but a more nuanced and inclusive one.

This is what Reuveny (2008) does as well, and across time and space. His foray into post-Katrina Louisiana

and Mississippi, 1950s Bangladesh, and the dust bowl of the United States during the 1930s offers a model that demonstrates pre- and postpolicy changes due to climate disasters and demonstrates that environmental change can trigger large outmigration, leading to violent conflict in areas receiving migrants. He asserts that policies seeking to minimize migration induced by climate change and violent conflict in receiving areas require an engineered economic slowdown in the developed countries and population stabilization and economic growth in the developing countries, financed by the developed countries. Either is a prescription for uneasy politics.

Within the realm of climate-change and political interaction models lie the works of those focusing on renewable, yet restricted, resources. Examples abound in examinations of water scarcity and conflict. The water conflict in northern Thailand was precipitated by a water shortage that ruined an orchard, causing the lowlanders to become angry toward the highlanders, as El Niño lessened precipitation during the rainy season of 1997. Ekkawatpanit, Kazama, Sawamoto, and Ranjan (2009) show that the conflict itself was less about a widespread water shortage (affecting most parties equally) than about the ability of wealthy farmers to purchase water while poorer ones became insolvent, which demonstrates that water scarcity on a discursive level does not reflect the real scarcity.

This is different from Pearce (2007), who makes a compelling case that a worldwide fresh and potable water shortage is *the* most fearful looming environmental crisis. His expository delivery of statistical evidence is indeed doomlike. What this work supplies the researcher is data, accompanied by a grim narrative. Unfortunately, the empirical connections are lost, and the effort comes across as less than rigorous.

Water, argues Shiva (2008), is intrinsically different from other resources and products and cannot be treated simply as a commodity: Without water, people and the environment cannot survive. To subject water to commercial restrictions and to control its availability to people and communities are normatively unacceptable. Contrary to others who claim that water scarcity will lead to conflicts in the future, Shiva provides evidence that water wars are already with us and are happening all over the world. She is convinced that conflicts will become increasingly violent as freshwater resources dwindle. Unfortunately for many readers, there is a tendency to dwell on the ethics and morals, and not fully develop the empirical arguments.

Humphreys, Sachs, and Stiglitz (2007) lead a post-modern indagation focusing on a particular extracted and processed resource, petroleum. They not only make a careful assessment of the effect extraction and processing have on climate but also discuss economic hindrances and helps deriving from oil funds. Their work is

the best representative of a host of efforts examining how the fight over petrodollars has exacerbated scarcity and conflict.⁷

Where Next?

The reassessments of this line of inquiry—specifically, methodological and empirical reassessments—have thus added new vigor to the discourse and sharpened the debate outside academe. An excellent take on how measurement matters comes recently from O’Lear and Diehl (2007):

In armed conflicts, particularly those involving natural resources and other environmental factors, the *issue of scale* remains overlooked and underanalysed. Although previous work has considered conflict at different analytical resolutions, scale itself is rarely addressed directly or as an important characteristic of a conflict. . . . Literature on natural resource related conflict has tended to overlook issues of scale and create a self imposed constraint on our understanding of conflict by determining a priori, and often indirectly, the scope or frame of a conflict. (p. 179)

In addition, authors are beginning to reevaluate Western notions of scarcity and its effects—for instance, Ember, Ember, Korotayev, and de Munck’s (2007) per-lustrative examination of fat and thin, noting that resource scarcity and valuing fatness in women are negatively associated when there is little or no food storage and *unrelated* when there is moderate or high storage. Such work helps to shape the field by reevaluating the marks and measures, assumptions and paradigms of the effect scarcity may have.

What Resource Problem?

Not all work in the field accepts that scarcity necessarily leads to conflict. Such an assumption has come under increasing scrutiny, leading to more, and frankly better, empirical assessments. Not all are supportive of the earlier findings—note Theisen (2008): “The theory relating civil violence to the degradation of natural resources receives only limited support” (p. 802). Theisen’s most recent work finds little support linking resource scarcity and civil conflict, but it replicates earlier findings on the importance of poverty, instability, and dependence of fuel exports, seemingly vindicating the free-market critics. Of note as well is Urdal’s (2005) assumption:

In the environmental security literature, great rural resource scarcity, causing rural to urban migration, is seen as an important source of violent conflict. . . . Urban disorder is primarily associated with a lack of consistent political institutions, economic shocks, and ongoing civil conflict. (p. 418)

Within the world of scholarship and popular political punditry, the counterarguments tend to follow eight lines, with some overlap:

1. There is no such thing as resource scarcity (Wright & Czelusta, 2004).
2. Resource scarcity may exist, but property rights ameliorate it (Mehta, 2007).
3. Resource scarcity may exist, but it is not the source of violent conflict (Dwyer & Oh, 1987).
4. Resource scarcity exists only in nondemocratic and/or corrupt states (Kalyuzhnova & Nygaard, 2008).
5. Resource scarcity may exist, but conflict management mitigates it (Himes, 2008).
6. Resource scarcity cannot exist where sufficient technological advances exist (Gowdy & Julia, 2007).
7. Resource scarcity may exist, but free markets prevent it (Horwitz, 2008).
8. Resource scarcity exists, but the data support no causality (Salehyan, 2008).

Outside academe, the counterarguments tend to be more strident:

1. There is no such thing as resource scarcity, and the theory that there is, is Marxist propaganda (Mills, 2008).
2. Resource scarcity doesn't exist, and the sources of violent conflict are Marxist redistributive policies (Lott, 2007).
3. Resource scarcity exists only in nondemocratic states because free markets prevent it from appearing in democratic ones (Corsi & Smith, 2005).
4. Resource scarcity may exist, but climate change and environmental degradation aren't the causes; corruption at the local level is (Singer & Avery, 2008).

The non-resource-scarcity literature is thin in most parts, but some of the academic critiques are worthy of further examination. But most of the non-resource-scarcity literature finds itself running headlong into the same wall repeatedly—the data and evidence in support of the various resource scarcity theories far outweigh those that do not. In the words of Krautkraemer (2005), “The general conclusion . . . is that technological progress has ameliorated the scarcity of natural resource commodities; but resource amenities have become more scarce, and it is unlikely that technology alone can remedy that” (p. 2).

Conclusion

Richard Matthew's summary (2008) of the state of the discipline is a clear, concise assessment of much of the scholarship, and the essays by Dobkowski and Wallimann (2002) can certainly serve as an ideal introduction to the subject. A number of works cited in this all-too-brief examination of the literature would serve as well as subject-specific overviews. But a unified treatment of the problems of resource scarcity and political conflict issuing from it is yet to be seen.

Part of this absence is due to the problems of definition and delineation, part to measurement, and part to empirical analyses. Le Billon (2007) makes a strong case, following the comparativists' admonishment, that scale matters—not only area, but amounts and impacts. Otherwise, we are comparing apples not to apples, or oranges, but to bricks. It thus stands that much, then, needs to be done in unifying the disparate treatments, universalizing the language, and standardizing the definitions and measures. Perhaps then can scholarship proceed and policy prescriptions begin.

Notes

1. Luke 1:52ff: *deposuit potentes de sede et exaltavit humiles*; that is, “[god] demolishes the thrones of the unjust and exalts the lowly.”

2. See Craig Duncan (1962), *Economic Geography*, 38(2), 113–121, or Lynn White (1962), *Medieval technology and social change*, Oxford University Press; also Tibor Scitovsky (1954), Two concepts of external economies, *Journal of Political Economy*, 17(1), 143–151.

3. See especially Raymond Mack and Richard Snyder (1957), The analysis of social conflict: Toward an overview and synthesis, *Journal of Conflict Resolution*, 1, 212–248, for a paradigmatic example.

4. A way to consider this approach, and the subapproaches over particular physical resources, is thus

$$X_{r1,t1} : Y_{r1,t1}, \quad (1)$$

where X and Y are entities (individuals, groups, nations), $r1$ is a resource, and t is time. Since the resource $r1$ is finite or near finite, it is necessarily contestable. As the ratio of possession, use, or production of $r1$ becomes more uneven or disparate, conflict is possible (P). Thus,

$$X_{\Delta \uparrow r1,t1} \longrightarrow Y_{\Delta \downarrow r1,t+1} \rightarrow P[\text{conflict}]_{t+n}. \quad (2)$$

Amelioration of conflict is, crudely, possible when $r1$ is more evenly allocated, or when other resources ($r2, r3, \dots rk$) become available that act as substitute or trade items for $r1$.

$$X_{\Delta \uparrow r1,t1} \longrightarrow Y_{\Delta \uparrow r2,t+1} \rightarrow -P[\text{conflict}]_{t+n} \quad (3)$$

Much of the work on scarcity and conflict thereby proceeds from these assumptions.

5. Compare this to the slightly earlier work by Binningsbø, de Soysa, and Gleditsch (2007). They test a general argument about the effects of resource scarcity by examining the most widely used measure of environmental sustainability: the ecological footprint. Contrary to the neo Malthusian argument, they find that entities with a heavier footprint possess greater propensities for peace.

6. Thomas Homer Dixon's (2009) prolific output on this subject is itself worthy of exploration.

7. See, to list a very few, Matthias Basedau and Jann Lay (2009), Resource curse or rentier peace? The ambiguous effects

of oil wealth and oil dependence on violent conflict, *Journal of Peace Research*, 46(3), 757–776; Hanne Fjelde (2009), Buying peace? oil, corruption and civil war, 1984–99, *Journal of Peace Research*, 47(2), 199–218; or Syed Murshed and Mohammed Tadjoeeddin (2009), Revisiting the greed and grievance explanations for violent Internal conflict, *Journal of International Development*, 21(1), 87–111.

ETHNIC CONFLICT

TINA KEMPIN REUTER

Christopher Newport University

Ethnic conflict is one of the major threats to international peace and security. The conflicts in the Balkans, Rwanda, Chechnya, Iraq, Israel/Palestine, Indonesia, Sri Lanka, India, and Darfur are only among the best-known and deadliest examples. The destabilization of provinces, states, and in some cases even whole regions are common consequences of ethnic violence. Ethnic conflicts are often accompanied by gross human rights violations such as genocide and crimes against humanity, economic decline, state failure, environmental problems, and refugee flows. Violent ethnic conflict leads to tremendous human suffering.

Despite the fact that the number of conflicts has declined over the past decades, ethnic turmoil remains one of the main sources of warfare and instability in major regions of the world. Between 1945 and 1990, nearly 100 ethnic groups were involved in violent conflicts. During the 1990s, about three quarters of conflicts were disputes between politically organized ethnic groups and governments. More than one third of the world's states were directly affected by serious internal warfare at some time during the 1990s, and of these states, nearly two thirds experienced armed conflicts for 7 years or longer during the decade. In 2006, all 32 ongoing conflicts were internal, 5 of which were internationalized; most of them were caused by ethnic issues (Harbom & Wallensteen, 2007).

Ethnic Identity, Ethnicity, and Ethnic Groups

The terms *ethnic* and *ethnicity* have their roots in the Greek word *ethnos*, which describes a community of common descent. In ethnic conflict research, the terms *ethnic group*, *communal group*, *ethnic community*, *peoples*, and *minority* are mostly used interchangeably. Two elements provide the basis to identify ethnic groups: first, the accentuation of cultural traits, and second, the sense that these traits distinguish the group from the members of the society who do not share the differentiating characteristic. These *ethnic criteria*, which provide the origins of communal identity, may include shared historical experiences and memories, myths of common descent, a common culture and ethnicity (including race), and a link with a historic territory or a homeland (which the group may or may not currently inhabit). Elements of common culture include language, religion, laws, customs, institutions, dress, music, crafts, architecture, and even food. Ethnic communities show signs of solidarity and self-awareness, which are often expressed by the name the group gives itself (Smith, 1986). The definitions of the terms *ethnic* and *ethnicity* in ethnic conflict research thus go beyond the general usage in North America, where *ethnicity* commonly refers to race (skin color and other physical markers) only.

Ethnic identity is formed by both tangible and intangible characteristics. Tangible characteristics such as shared culture or race are important because they contribute to the group's feeling of identity, solidarity, and uniqueness. As a result, the group considers perceived and real threats to its tangible characteristics as risks to its identity. If the group takes steps to confront the threat, ethnicity becomes politicized, and the group becomes a political actor by virtue of its shared identity. On the other side, ethnicity is just as much based on intangible factors, namely, on what people believe, or are made to believe, to create a sense of solidarity among members of a particular ethnic group and to exclude those who are not (Smith, 1991) members.

Although communal identity provides the foundation for the definition of ethnic groups, disagreement exists over how ethnic identity forms and how it changes over time. A first school of thought, known as the *primordialist approach*, explains ethnicity as a fixed characteristic of individuals and communities (Geertz, 1973; Isaacs, 1975; Smith, 1986). According to primordialists, ethnicity is rooted in inherited biological traits and/or a long history of practicing cultural differences. Ethnic identity is seen as unique in intensity and durability and as an existential factor defining individual self-identification and communal distinctiveness. Mobilization of ethnic identity and ethnic nationalism is a powerful tool to engage the group in a political struggle. Ethnic divisions and ethnic conflict are considered inherent to multiethnic societies and a common phenomenon.

The primordialist focus on fixed identities, however, fails to recognize variation in ethnic group formation, ranging from relatively short-term associations to long-standing, strong, and cohesive groups with biological and historical roots. To account for these differences, a second, so-called *instrumentalist*, approach developed, which understands ethnicity as a tool used by individuals and groups to unify, organize, and mobilize populations to achieve larger goals (Brass, 1985; Glazer & Moynihan, 1975; Noel, 1968). These goals are mostly of a political nature and include, among others, demands for self-governance, autonomy, access to resources and power, respect for the group's identity and culture, and minority rights. In this view, ethnicity has little or no independent standing outside the political process and is in its character comparable to other political affiliations such as ideological beliefs or party membership. According to instrumentalists, ethnicity is a result of personal choice and mostly independent from the situational context or the presence of cultural and biological traits. Ethnic conflict arises if ethnic groups compete for the same goal, notably power, access to resources, or territory. Elite interest plays an important role in mobilizing ethnic groups to engage in ethnic conflicts. Ethnic conflict is thus similar to other political interest conflicts.

Critics of instrumentalism argue that ethnicity, in contrast to political affiliations, cannot be decided on by individuals at will but is embedded within and controlled by the

society as a whole. Advocates of *social constructivism* point to the social nature of ethnic identity and argue that ethnicity can only be understood in a relational framework (Anderson, 1991; Brubaker, 1995; Dominguez, 1989; Laitin, 1986). In their view, ethnicity is neither fixed nor completely open. Ethnic identity is created by social interactions between individuals and groups and remains therefore beyond a person's choice, but it is subject to change if the social conditions change. Individuals and groups cannot escape the fact that ethnic differences exist, but they determine themselves what they make of these differences (Wolff, 2006). Ethnic conflict depends thus to a great extent on the opportunities provided for the group to reach their goals. Violent conflict is caused mainly by social and political systems that lead to inequality and grievances and do not offer options for the peaceful expression of differences (e.g., discriminatory regimes). Changes in social interactions, such as increased tensions or violent conflict, influence the socially constructed nature of ethnicity. Social constructivists explain the tremendous atrocities committed during ethnic conflicts, such as genocide, mass rape, ethnic cleansing, and so forth, by the fact that by virtue of their ethnicity, everyone is part of the struggle (Chipman, 1993).

A fourth view ascribes to ethnicity deep cultural and psychological roots, which make ethnic identity extremely persistent (Ross, 2001; Volkan, 1997). *Psychocultural interpretations* stress the importance of shared, deeply rooted worldviews that shape group members' relationships with others, their actions and motives. These worldviews influence members' perception of origin, the intensity of their identity, and the significance of political action. Ethnic identity cannot be changed, only made more tolerant and open-minded. Ethnic conflict engages central elements of each group's identity and invokes fears and suspicion about real and potential opponents. Ethnic conflict is thus not simply a political event but a drama that challenges the very existence of the group by contesting its identity. This explains why ethnic conflicts are very difficult to resolve.

In reality, some ethnic groups have identities with deep historical roots whereas others do not, and some groups have static identities, whereas others have dynamic identities. The concrete expression of ethnicity and its propensity to lead to violence and warfare depend on the context. Ethnic identities are adaptable to and activated by unexpected threats and new opportunities. Ethnicity cannot be politicized unless an underlying core of memories, experience, or meaning moves people to collective action. As a result, ethnic identity usually "can be located on a spectrum between primordial historical continuities and (instrumental) opportunistic adaptations" (Esman, 1994, p. 14).

Several factors contribute to the salience and intensity of ethnic identities. Indisputably, the strongest factor is war and violence. First, the history of common efforts, stories of sacrifices for a common goal, and memories of human suffering create strong connections among the members of affected ethnic groups. Similarly, if a group

experiences economic, political, and cultural discrimination, group cohesion tends to increase. Second, a group's ethnic identity is stronger if mass literacy is achieved. Literacy allows elements of identity to be stored in writing, which means that historical and cultural narratives can reach a mass audience and stay the same over time. Even if an ethnic identity lies dormant for some time, it can be revived. Finally, the identities of nonimmigrant groups tend to be more pronounced than the identities of immigrant ethnic groups. While immigrants often assimilate, nonimmigrant minorities generally adhere to their traditions, especially if they are easily distinguished from the rest of the society by tangible traits such as physical markers (Gurr, 1993).

Not all ethnic groups are politically active or engage in ethnic conflict. According to the Minorities at Risk Project (www.cidcm.umd.edu/mar/), which tracks 283 mobilized ethnic groups, at least 17.4% of the world's population identifies with politically active ethnic groups. Depending on the political structure of the state (democracy vs. authoritarian regimes) and the size and situation of the ethnic minority (large vs. small portion of the society, regionally concentrated vs. dispersed), ethnic groups will have different claims and will use different means to voice their demands. The Minorities at Risk Project distinguishes six different group types: ethnonationalists, indigenous peoples, ethnoclasses, communal contenders, religious sects, and national minorities. *Ethnonationalists* are large, regionally concentrated ethnic groups with a history of autonomy or separatist struggles. Examples include the Quebecois in Canada, the Kurds in Iraq, and the Tibetans in China.

Indigenous peoples are original inhabitants of a colonized territory. These groups typically have traditional social, economic, and cultural customs that set them apart from the rest of the society (e.g., Native Americans, the Maasai in Africa, and the Aborigines in Australia). Even though indigenous peoples are often sharply distinct from the dominant group (they usually are set apart, not only by physical markers, but also by language, religion, traditions, etc.), they tend to be badly organized, have weak connections among group members, and, consequently, are usually unable to voice their claims (mostly to land and access to resources) in a successful manner. As a result, indigenous peoples are among the most marginalized ethnic groups in the world.

Ethnoclasses are racially or culturally distinct groups of people who are usually descendants from slaves or immigrants. African Americans in the United States or Muslim minorities in France are good examples of ethnoclasses. In many cases, these groups perform distinctive economic activities, mostly at the bottom of the economic hierarchy. Ethnoclasses generally strive for equal treatment, economic opportunities, and political participation. Mobilization of these groups varies widely. Ethnoclasses have successfully pursued their interests in many Western democracies whereas they remain relatively unorganized in most other places.

Communal contenders are culturally distinct groups that hold or seek a share in state power. Some of them can also be classified as ethnonationalists opting for separatism and seeking independence (e.g., the people of southern Sudan). The Minorities at Risk Project distinguishes between *dominant*, *advantaged*, and *disadvantaged* communal contenders. Dominant groups hold both political and economic power over other groups in their societies (e.g., the Sunni in Iraq under Saddam Hussein, Whites in South Africa during the apartheid regime, and the Tutsi in Burundi). Advantaged groups enjoy political benefits but are not in control of governing power (e.g., the Punjabis in Pakistan). Disadvantaged communal contenders are the most common; they often face political or economic discrimination or both (e.g., the Chinese in Malaysia and the Tajiks in Afghanistan). Changes to group relations involving communal contenders are particularly likely if power structures change. Intergroup shifts of relative political influence and economic prosperity can provoke violent actions, which tend to be particularly long lasting and disastrous, as illustrated by the conflicts between north and south Sudan (1956–2005) or different groups in Lebanon (1975–1990). Power-sharing models that take differences and external changes into account are the only way to deal with these issues. However, as history shows, these power-sharing arrangements are often very difficult to achieve.

Religious sects are ethnic groups that differ from the rest of the society, mostly by their religious beliefs and related cultural practices. Religious minorities tend to have high group cohesion because religion is a highly salient trait. In addition, religious groups usually already possess an organizational structure, which makes mobilization of the groups particularly easy and likely. Most groups in this category are Muslims and include both Islamic people in non-Muslim societies (e.g., Algerians in France, Arab citizens of Israel, or Turks in Germany) and different sects within a Muslim society (e.g., Sunni and Shi'a in Iraq). Non-Islamic groups include, among others, the Catholics in Northern Ireland, Jews in Argentina, the Copts in Egypt, and the Baha'i in Iran. For these politicized religious minorities, their faith is what sets them apart, but their goals are political in nature (e.g., participation in the government, nondiscrimination, or the recognition of the minority).

Finally, *national minorities* are groups with kinfolk in a neighboring state but who are a minority in the state in which they reside. Most of these groups have a history of political autonomy, which they strive to reinstate. Examples include Greeks in Albania, Russians in the Baltic, Hungarians in parts of Serbia, and Arabs in Iran.

The Origin and Nature of Ethnic Conflict

Conflict describes a situation in which two or more actors pursue incompatible goals. It is not necessarily violent, but the use of *tension*, *dispute*, or *unease* is more common in a nonviolent context. A violent internal conflict is generally

called a *civil war* or *armed conflict* if casualties and destruction are substantial, the conflict had a certain duration, the protagonists are organized, and military operations are used to achieve political goals (Brown, 2001b).

Ethnic conflict is a form of conflict in which the goals of at least one party are defined in ethnic terms, and the conflict, its causes, and potential remedies are perceived along ethnic lines (Horowitz, 1985). The conflict is usually not about ethnic differences themselves but over political, economic, social, cultural, or territorial matters. The conflicts in Northern Ireland or Israel/Palestine, for example, are not religious conflicts, but political conflicts, because the goals at stake are political, not religious in nature.

If the political goal of ethnic mobilization is self-determination, the movement is called *nationalism*. A *nation* in this context is a politicized ethnic group with the desire for self-government, ranging from participation in public affairs to local segmental autonomy to territorial claims, including independence (Van Evera, 1994). The use of the word *nation* is problematic. On the one side, *nation* can mean the state as a whole (the way the term is used in *international* or *United Nations*). If *nation* refers to people in this context, it can be understood as the aggregate, permanent population of the state, based on citizenship. On the other side, *nation* is also widely used to refer to a politicized ethnic group, in which case the link among people is based on ethnicity rather than citizenship.

Ethnic disputes are common in every multicultural society. Intergroup problems arise in periods of substantial political, economic, and social change and lead to uncertainty, emerging opportunities for action, and particularistic interests. Grievances and polarizing leadership lead to mobilization, ranging from political action (conventional politics, strikes, demonstrations, and other nonviolent means) to violent acts such as terrorism, armed uprisings, and guerrilla and civil wars (Horowitz, 2001).

Causes of Ethnic Conflict

Michael Brown (2001a, 2001b) distinguishes between *underlying* and *proximate* causes for ethnic conflict. Underlying causes include structural factors, political factors, economic and social factors, and cultural and perceptual factors. Proximate causes embrace four levels of conflict triggers: internal, mass-level factors (bad domestic problems); external, mass-level factors (bad neighborhoods); external, elite-level factors (bad neighbors); and internal, elite-level factors (bad leaders). Both underlying and proximate causes have to be present for ethnic conflict to evolve.

Underlying Causes

Structural Factors. *Weak states* or *failed states* are often a starting point for ethnic conflict. Most of these states are artificial products (e.g., former colonies) and lack

political legitimacy, ethnically sensible borders, and effective political and legal institutions. Violent conflicts are likely if changes in the economic situation of a state (e.g., cuts in foreign aid, corruption, administrative incompetence, and the inability to promote economic stability) are associated with the deterioration of the political situation in the country and the mobilization of ethnic groups. Group rivalry can lead to military mobilization, which leads to general armament of all ethnic groups within the state. This causes a security dilemma; by taking steps to defend themselves, ethnic groups often threaten the security of others (Posen, 1993). The ethnic security dilemma involves aspects of physical security (threats to the existence of the group), political security (oppressive regimes, exclusion from political participation), economic and social security (no equal opportunities for economic and social advancement of the group), cultural security (forced assimilation), and environmental security (destruction of a minority's land and resources; Wolff, 2006). Violent conflicts and internal security dilemmas lead to massive human rights violations, refugee flows, and spillover effects with the potential to destabilize whole regions.

Ethnic geography, namely, the geographic distribution and territorial concentration of ethnic groups in pluralistic states, is a second factor that contributes to the likelihood of violent ethnic conflict. Ethnic conflict is particularly common in states with territorially concentrated ethnic groups located near a border or with ethnic kin in an adjacent state (Fearon & Laitin, 2003). These groups show high levels of organization and increased group cohesion and are able to use shared homelands as a territorial base for their political struggle.

Political Factors. Ethnic conflict is particularly likely in states in which ethnic groups are inadequately represented in the government, the courts, the police, the military, political parties, and other public and political institutions. Authoritarian one-party regimes with discriminatory legislation and lack of opportunities for ethnic groups to participate in state decision-making processes are particularly prone to ethnic conflict. Liberal democracies that focus on the ideals of inclusion, political debate, and the attempt to reach consensus among all participants in the political process facilitate nonviolent ethnonational action and are thus less likely to experience rebellion or uprisings (Gurr & Harff, 2003). A second cause of conflict is exclusionary national ideologies. Nationalism and, in an increased form, citizenship based on ethnic distinctions are especially dangerous because such ideologies tend to flourish in situations of political uncertainty and economic collapse. Other forms of exclusionary national ideologies include religious fundamentalism and supremacist, fascist expressions. Third, the occurrence of violent ethnic conflict depends on stable domestic intergroup relations. Violent conflict is especially likely if the claims are incompatible, groups

are strong and organized, action is possible, success is achievable, and the fear of suppression and discrimination is tangible (Brown, 2001b). Tactics employed by leaders and elites during political turmoil are crucial: *Scapegoating*, *hate speech*, and *instrumentalization of the mass media* are means that have the potential to aggravate ethnic tensions.

Economic and Social Factors. Economic slowdowns, stagnation, deterioration, and collapse are sources of destabilization of the state and can lead to increased tensions and competition among ethnic groups. Competition for limited natural resources is one of the major factors leading to ethnic conflict. In addition, discriminatory economic systems with unequal economic opportunities, access to land and resources, and vast differences in standards of living generate resentment and contribute to tensions and destabilization. Fast economic transitions (e.g., from centrally planned to market economies) and development can aggravate instability by creating favorable conditions for domestic migration, urbanization, and other societal changes. These changes also raise hopes for economic and political gains that can provoke frustration if these expectations are not met.

Cultural or Perceptual Factors. Cultural factors such as problematic group histories, stereotypical perceptions, and grievances over cultural discrimination, including restricted educational opportunities, legal and political limitations on the use of the minority language, and constraints on religious and cultural practices, are common causes of ethnic conflict. In addition, a weakening of traditional forms of dispute settlement (such as a *council of elders*) changes the environment for conflict resolution of ethnic disputes (Brown, 2001a).

Proximate Causes

Proximate causes can be categorized according to (a) whether they are triggered by elite-level or mass-level factors and (b) whether they are triggered by internal or external developments. Brown (2001a, 2001b) identifies four main types of proximate causes of internal conflict:

1. Bad domestic problems (internal, mass level factor)
2. Bad neighborhoods (external, mass level factor)
3. Bad leaders (internal, elite level factor)
4. Bad neighbors (external, elite level factor)

First, internal mass-level factors create bad domestic problems such as rapid economic development, modernization, patterns of political or economic discrimination, and internal migration (urbanization). Refugees or fighters from neighboring countries who cross the border often bring violence and turmoil with them.

Second, radicalized politics can lead to contagion, diffusion, and spillover effects and create “bad neighborhoods”

(external mass-level causes). For instance, the Hutu refugee camps in Zaire became prime recruitment zones for rebel forces.

Third, internal elite-level aspects include power struggles by leaders of different groups, ideological contests over the way a country should be organized, and criminal assaults. Leaders have the ability to “play the ethnic card,” which can lead to increased tensions between ethnic groups. Milosevic’s policies in the former Yugoslavia are a good example. By using the national media, Milosevic fueled nationalist movements and hate toward non-Serbian groups, which led to ethnic cleansing and gross human rights violations committed during the wars in the 1990s.

And finally, external, elite-level factors are the results of decisions by governments to trigger conflicts in weak neighboring states for political, economic, security, or ideological reasons; an example is Russian involvement in Georgia (Abkhazia and South Ossetia). In addition, ethnic minorities in some cases decide to wage a violent struggle in the hope of political gains and international support. Ethnic groups assume the willingness of the international community to react and to provide a political forum to support negotiation, arbitration, and the settlement of disputes. The assumption of intervention by the international community can, in the worst case, cause the very tragedies international engagement in ethnic conflict tries to prevent. This happened, for example, in Kosovo in the late 1990s. The Kosovar Albanian rebel forces were convinced that if they could provoke the Serbs to attack ethnic Albanians, the international community would intervene on their behalf and thus facilitate their goal of independence. The plan seemed to work out: The rebels began shooting large numbers of Serbian police and civilians in 1997, the Serbs responded by bloody counterinsurgency in 1998, and the North Atlantic Treaty Organization bombed the Serbs in 1999, occupying the province and thereby establishing Kosovo’s de facto independence. However, both the Serb counterinsurgency and the Albanian attacks on Serbs after Serbia’s defeat caused the death and displacement of thousands of people on both sides, thereby leading to a tragedy that could have been prevented. These deaths were a direct consequence of the promise of humanitarian intervention (Kuperman, 2004).

Conflict Dynamics

Once ethnic conflict breaks out, it is difficult to stop. Massive human rights violations and physical attacks on civilians such as rape, torture, mass killings, ethnic cleansing, and genocide lead to tremendous human suffering. Systematic discrimination and exclusion from national and local political decision making, the appropriation of ethnic minorities’ traditional homelands, and policies that marginalize ethnic minorities are common practices accompanying ethnic conflict.

Even if fought at a low level of intensity, protracted ethnic conflicts have a great impact on the affected society. The lack of functioning or legitimate political institutions, weak economic performance, nonexistent or polarized structure of civil society, and antagonized elites lead to polarization and separation, eroding cross-cutting cleavages and leaving societies deeply divided and prone to further ethnic strife. In addition, ethnic conflicts have very direct effects far beyond their epicenters. These involve refugee flows, internal displacement, regional instability, economic failures, environmental disasters, diffusion and spillover effects, and conditions for organized crime and terrorism. Ethnic conflicts spread in two ways. Diffusion occurs when an ethnic conflict in one state stimulates conflict in another state with similar conditions. Successful movements provide images and moral incentives resulting in the motivation and mobilization of other ethnic movements in similar economic and political conditions. *Escalation* or *contagion effects* occur when a conflict in one country spreads across borders into neighboring countries in which an ethnic minority has its kinfolk. This usually involves the engagement of new foreign fighters who are employed by local elites. Ethnic conflicts may start out as intrastate disputes, but become regional or international crises when foreign powers get involved.

Neighboring states, regional powers, and international powers are often overwhelmed and unable to deal with international consequences of ethnic conflicts. However, in many cases, these external actors are not passive victims of ethnic crises but actively pursue their own agendas and interests. Foreign sympathizers and diasporas can contribute substantially to a group's cohesion and mobilization by providing financial, military, political, and moral support. External actors in some cases play important roles in inflaming conflicts or prolonging violent struggles. Opportunistic interventions to gain military, economic, or political benefits take advantage of conflict-affected states and contribute to the conflict. At the same time, international involvement can be crucial in preventing and settling ethnic conflict. The international community plays a role in negotiating, organizing, and supervising ceasefires and peace agreements; investigating past human rights violations; implementing the provisions of peace settlements; conducting peace operations including humanitarian, military, and economic assistance; imposing arms embargos and economic sanctions; and providing mechanisms of confidence and capacity building and of solving future disputes with peaceful means. Neighboring states and the international community can thus be victims of the troubles in the region or active contributors—sometimes deliberately, in other cases unintentionally—by providing military, economic, or political support of ethnic groups or engaging in negotiation and peace implementation. Regional instability is as much a source of ethnic conflict as it is a consequence.

Ethnic Groups and Ethnic Conflict Worldwide

Ethnic Groups

Given the aforementioned vague definition of ethnic groups, no one really knows how many ethnic groups exist in the world. Estimations range from a few hundred to a few thousand. The reasons for these discrepancies are manifold. Each state has different methods of determining group affiliation. While one state labels a group White, another distinguishes among different heritages. In addition, the fact that self-identification with an ethnic minority often comes with disadvantages leads to unreliable censuses. In other cases, ethnic minorities tend to overestimate their numbers to get benefits from the government or to put themselves in a stronger position (see, e.g., the entry for Albania in the U.S. Central Intelligence Agency's *World Factbook* (U.S. CIA, n.d.), which notes that as of 1989, estimates of the Greek population ranged from 1% in official Albanian statistics to 12% in statistics from a Greek organization). A further complication is that one ethnic group can have many different names. The group might have a name for itself, the state might have second one, ethnic kinfolk in a neighboring state might label themselves in a third way, and scholars might use a fourth name to refer to parts or the entire group. Finally, numbers fluctuate due to migration and other factors, such as fertility and mortality rates. According to the U.S. Census Bureau, for example, the growth of the U.S. Hispanic population from 9.6 million in 1970 to 102.6 million (projected) in 2050 will lead to major changes in the composition of the U.S. population, with the current majority (White) losing its majority status.

Around 80% of states are multiethnic societies, meaning that no ethnic group dominates the society. The remaining 20% are either states that are truly ethnically homogeneous (e.g., Japan and Korea) or states with overwhelming majorities (such as China, France, and Germany, which are home to many different ethnic groups). China, for example, has 57 official ethnic groups, but 91.5% of the people are Han (U.S. CIA, n.d.). In contrast, ethnically heterogeneous states comprise two or more ethnic groups, none of which is completely dominant. These groups can be regionally concentrated, as for example in Canada, Switzerland, or Belgium, or dispersed, as in the United States.

Ethnic Conflict

Ethnic conflict has been the world's most common source of warfare, insecurity, and loss of life. According to the Minorities at Risk database, 121 ethnic conflicts occurred between 1945 and 2003. Some 60% of conflicts started before 1990, and the other 40% started after 1990, thereby making the last decade of the 20th century the decade with the most ethnic conflicts. Since 1955, nearly

50 ethnic groups have been targeted in campaigns of genocides and ethnic cleansings that killed between 13 million and 20 million civilians (Marshall & Gurr, 2005). These civil wars, mass murders, and violent campaigns led to more than 14 million internationally recognized refugees and about 17 million internally displaced people (U.S. Committee for Refugees and Immigrants, 2008). Today, most ethnic conflicts occur in sub-Saharan Africa and Asia.

Many of these conflicts are protracted conflicts, meaning that they have lasted 10 years or more. The Sudanese civil war between the Arab-Muslim north and the Christian-Animist-African south, for example, is the longest and deadliest civil war in the second half of the 20th century. Most ethnic conflicts do not meet the threshold of wars (1,000 or more battle-related deaths in a year). Low-level rebellions, minor armed conflicts (at least 25 battle-related deaths per year), terror campaigns, and large-scale protest movements with occasional violence are more common. Patterns of escalation and de-escalation are typical scenarios. The Sri Lankan civil war, for instance, started in the early 1980s between the Sinhalese government and Tamil rebel groups and ended in 2009 with the defeat of the Tamils. During the conflict, high and low levels of intensity alternated; the conflicting parties negotiated various cease-fires and peace agreements, followed by insurgencies and high levels of violence and death.

The Clash of Civilizations

The idea that cultural differences lead to violent behavior of political actors is also the foundation of Samuel Huntington's famous *Foreign Affairs* article "The Clash of Civilizations?" (1993) and his subsequent book *The Clash of Civilizations and the Remaking of World Order* (1996). From the premise that sameness leads to peaceful relations whereas difference produces disorder and conflict, Huntington argues that cultural and ethnic differences between "civilizations," namely, states or groups of states that distinguish themselves by cultural traits, will lead to conflict. These cultural differences are first and foremost religious in nature, although linguistic and geographic proximity also play a role. He identifies the following as major civilizations:

- Western civilization (western and central Europe, North America, and Australia)
- Latin American civilization (Central and South America)
- Slavic Orthodox civilization (former Soviet Union states [excluding Central Asia], former Yugoslavia [excluding Slovenia and Croatia], and eastern Europe)
- Buddhist civilization (Asian states, including Thailand, Sri Lanka, Laos, Cambodia, Mongolia, and Myanmar/Burma)
- Confucian civilization (China and the Chinese diaspora, North and South Korea, Singapore, Taiwan, and Vietnam)
- Hindu civilization (India and the Indian diaspora, Nepal)

- Japanese civilization
- Islamic civilization (Middle East, North Africa, Central Asia, Indonesia, Malaysia, and Brunei)
- (Sub Saharan) African civilization (southern, central, and eastern Africa)

Some civilizations overlap or are categorized into sub-civilizations (e.g., Western civilization is divided into the European and North American categories; Islamic civilization into Arab, Persian, Turkish, and Indonesian subdivisions). Turkey, Ethiopia, Haiti, and Israel are excluded from this classification of civilizations and designated as so-called *lone countries*.

The idea of classifying the world into civilizations is not entirely new. The British historian Arnold J. Toynbee (1960) concluded, in his book *A Study of History*, that the world consists of 21 civilizations. The German historian and philosopher Oswald Spengler (1918/1991) divides the world into eight cultures in his book *The Decline of the West* and follows a pattern very similar to Huntington's divisions (excluding most of Africa). The term *clash of civilizations* was crafted by British scholar Bernard Lewis (1990) in his article titled "The Roots of Muslim Rage," in which he describes the rivalry between Islam and the Judeo-Christian heritage. Huntington's work endorses Lewis's hypothesis of the clash of civilizations and expands the theory to the global scale.

According to Huntington (1996), future conflicts or "clashes" will happen between these civilizations, either on the local and regional level (what he calls "fault line conflicts") or on the global level between major states of different civilizations ("core state conflicts"). He points out that these conflicts will be mostly between the Western civilization, which currently enjoys hegemonic status, and major challengers, namely the Confucian and Islamic civilizations. East Asia, and above all China, threatens the West mostly because of rapid economic growth, and the rise of fundamentalism in the Islamic world challenges Western values such as liberal democracy and human rights. Huntington sees a potential alignment of these two "challenger civilizations" as both have a history of conflict with the West. In addition, so-called swing civilizations, namely Russia, India, and Japan, who might favor either the West or the challengers, further destabilize the world because their affiliations are unclear, but their power is extensive enough to bring about major changes.

Huntington's (1993, 1996) main prediction is that future conflicts will be fought between Muslims and non-Muslims. Conflicts along boundaries between Muslims and non-Muslims, as in the Philippines, Kashmir, Chechnya, Kosovo, Bosnia, Sudan, Nigeria, and Palestine, are seen as proof that "Islam has bloody borders" (Huntington, 1993, p. 35). Historical clashes of Christians and Muslims dating back to the Middle Ages and the fact that both Islam and Christianity are absolute, universalist religions with a mission to spread their faith are portrayed

as the reasons for current and future problems between the Christian (Western) and Islamic civilizations. The attacks of September 11, 2001, and the subsequent events in Afghanistan and Iraq have been interpreted as proof of Huntington's predictions.

Critics, however, point out that empirical evidence does not support Huntington's thesis. Empirical studies find no increase in the frequency of intercivilizational conflicts and show that state interactions across civilizational divides are not more prone to conflict. Similarly, Huntington's (1996) "kin-country syndrome" (p. 272), namely, the idea that in case of a war, people from the same civilization will support others with the same cultural identity, cannot be empirically established. Scholars have thus disproved major aspects of the theory of the clash of civilizations (Chiozza, 2002; Fox, 2002; Tuscisny, 2004).

Others point to the fact that clear cultural boundaries do not exist in reality. Why separate Japan from China? Why not separate Vietnam from China? Why not distinguish between Catholic and Protestant states in the West? Ideological and philosophical differences, paired with political and economic discrepancies, are the most important factors influencing the likelihood of conflict (Berman, 2003). In turn, ideological and political values such as democratic governance and the rule of law are more easily transmitted than Huntington suggests (Ajami, 1993). Many non-Western states have become democratic over the past decades, and the European Union has expanded beyond western Europe. Cultural perceptions play a secondary role. In addition, many argue that nation-states will remain the major players in international politics. Most conflicts will be fought between states of the same civilization or, more likely, within states (Gray, 1998; Hunter, 1998; Walt, 1997).

Although Huntington's thesis has its merits and has led to considerable scholarly debate, it cannot be empirically proven and has major flaws. Huntington's classification of civilizations is difficult to apply to reality. For example, although all states or groups in the Islamic civilization are mainly Muslim, they express very different worldviews (e.g., Bosnians, Indonesians, and Arabs face completely different economic, social, and political circumstances). In addition, most conflicts today are not conflicts between civilizations but rather conflicts within civilizations and within states. The major causes for conflict today are not cultural differences but economic and political problems, ideological disagreements, and discrimination. It is safe to say that most political scientists today have serious doubts about major elements of Huntington's thesis.

Conclusion

Cultural differences and ethnic conflicts are important issues shaping international politics. Because cultural affiliations and ethnic identity are particularly strong factors

shaping group relations, these conflicts have led to tremendous human suffering and are a significant threat to international security. Instability, refugee flows, spillover effects, and other international consequences guarantee that ethnic conflict remains an issue on the international political agenda. However, it is not the cultural differences per se that lead to conflict but political, ideological, and economic goals of international actors, regardless of whether these actors are states, ethnic groups, or "civilizations." Given the complexity of ethnic and cultural conflicts, there is no "silver bullet solution" to solving related issues.

COMPARATIVE POLITICAL PARTIES

Systems and Organizations

ALEXANDRA COLE

California State University, Northridge

Political parties and party systems are of interest to the scholar of comparative politics because they are constantly in flux. A common understanding of the political party, according to Leon D. Epstein (1967), is of a group that “seeks to elect governmental officeholders under a given label” (p. 9). *Party systems* are described by the number of parties within a given country during a given time, along with their “internal structures, their ideologies, their respective sizes, alliances, and types of opposition” (Duverger, 1972, p. 18). Party systems can have as few as one major political party, or may have many political parties. Elections are the venue in which competition for government office takes place. Elections bring changes in the policies advocated by parties, the seats held by political parties, and of course the composition of government. It is important to note that political parties do not make changes in a vacuum; change often comes in anticipation of, or in reaction to, changes that other political parties in the system make. This makes the party system a system of interaction between political parties (Sartori, 1976).

This chapter will examine political party systems in a comparative context. We will begin with a broad discussion of political parties. The difference in number, type, and ideology of political parties across different party systems has much to do with the political development

of a polity. Though there may be similarities in the ideologies of political parties in different systems, the parties may behave differently because of the dynamics within their own systems. Political parties that would never work together in one system because of ideological differences may be coalition partners in another system. This may have to do with the electoral rules of a system and the prospects for formation of a coalition government, or it may have to do with attitudes toward the political system in general. We will see that ideological considerations often have less to do in explaining the behavior of a political party compared with the potential for policy outputs. We end the chapter with a discussion of whether political parties are in decline, and the potential effects of such a decline.

The Formation of Political Parties

We understand *political parties* as organizations that regularly compete for public office in that they put forth candidates for election (Sartori, 1976). The formation of political parties is generally associated with the extension of suffrage and the development of representative government (Duverger, 1972). Joseph LaPalombara and

Myron Weiner (1966) suggest that political parties are endemic to “modern and modernizing political systems”: A political party will emerge once a “political system reaches a certain degree of complexity, or whenever the notion of political power comes to include the idea that the mass public must participate” (p. 3). These definitions seem to place political parties as 20th-century phenomena, although Seymour Martin Lipset and Stein Rokkan (1967) theorized that many of the political parties that existed at the end of the 20th century were based in part on earlier political conflicts dating back to at least the 19th century if not earlier. Specifically, these conflicts ranged from national revolutions to the political aftermath of the Industrial Revolution. From these events arose cleavages, or divisions, within societies that gave rise to political groupings. Lipset and Rokkan suggest that there are hierarchies in cleavages within systems and over time, which helps to explain the differences in political groupings across countries. It is important to note that the cleavages themselves may also change, or even lose relevance.

The most common cleavages can be classified as territorial and functional. *Territorial* cleavages arise when there is conflict between the central nation building culture and that of the periphery. Peripheral cultures are those differing in ethnicity, language, or religion from the center of the nation (Lipset & Rokkan, 1967), which often places the peripheral culture in the position of subject culture. *Functional* cleavages can be interest specific or ideological. Interest-specific cleavages are those that reflect conflict over resources (Lipset & Rokkan, 1967), whereas ideological cleavages often reflect differing worldviews. For example, in national revolutions the conflict between the nation-building center and periphery represents a territorial cleavage, whereas the often accompanying conflict between church and state results in a functional cleavage of religious versus secular worldviews. Industrial revolutions, which can pit the interests of industrialists against those of landed interests, can be territorial, whereas the conflict between owners and workers is functional in nature. Together, these constitute the four critical lines of cleavage that Lipset and Rokkan (1967) suggest explain the variance in many modern competitive party systems.

The transformation of a conflict into a cleavage and then a political grouping, or party, takes place only after particular thresholds are crossed in the development of a nation-state. These thresholds are (a) *legitimation*: Is there recognition of the right of protest? (b) *incorporation*: Are supporters of a movement given political citizenship rights? (c) *representation*: Can the new movement exist on its own, or must it join with older movements? and (d) *majority power*: Are there checks and balances against numerical majority rule? (Lipset & Rokkan, 1967). The first two thresholds specifically influence the development of a political party, whereas the latter two are related to the

growth and development of the party system. As the first two thresholds occur roughly at the same time as the extension of mass suffrage, the contours of the party system are set relatively early in the life of the nation-state; thus the observation from Lipset and Rokkan (1967) that the “crucial differences among the party systems emerged in the early phases of competitive politics before the final phase of mass mobilization” (p. 114).

Lipset and Rokkan suggest that much of the development of party systems in Western Europe followed this model. Although political parties may differ, overall one may speak of *party families*, in which ideological tendencies are reflected by parties across different states. Beyme (1985) suggests that parties based on ideological principles have had more success in establishing themselves in western Europe than have parties based on specific conflicts. The earliest modern political parties, *liberal parties*, established themselves as supporters of representative democracy and constitutionalism. This involved the recognition of individual rights and the preservation of individual property. Within liberalism was a secondary, more radical branch that supported direct rule by the people, meaning the extension of suffrage to the masses. Liberal parties first emerged in England in the 1700s and in France after 1830. In many cases, they were the first parties to form in representative democracies. Over time, they have become smaller parties in many political systems. Though smaller, liberal parties such as the Free Democratic Party of Germany often govern as part of a ruling coalition.

Conservative parties developed alongside liberal parties, often as a response to liberal parties. The conservative ideal is the preservation of historical continuity, with a belief in the divine, valuation of traditional forms of life, and recognition of private property and freedom (Beyme, 1985). Conservative parties serve as a buffer to liberal parties because conservative parties oppose rapid change, which is presumed to threaten the social order. Conservative parties tend to be in more secularized political systems. England's Conservative Party is one of the most well-known conservative parties.

Both liberal and conservative parties established themselves while representative governments formed, primarily reacting to the conflicts within a particular political system. The constituencies for liberal and conservative parties were necessarily small; not all the inhabitants of a democratizing polity had the franchise, and liberal and conservative parties tended to represent the upper classes. In contrast, *socialist* parties were the first parties to form outside representative bodies of government, often at the same time in which the franchise was extended to all. According to Beyme (1985), socialists were aiming for revolutionary reversal rather than maintenance of the “principles of 1789”: liberty, equality, and fraternity. Socialist parties tended to mobilize the newly enfranchised working classes. Mostly worker based and highly unionized, socialist parties sought better conditions

for workers and demanded more state intervention in the economy. The constituency for socialist parties has largely stayed the same, as can be seen in cases such as the French Socialist Party. After World War II, socialist parties largely abandoned calls for full state intervention in the economy, instead focusing on implementation of stronger control mechanisms in the economy.

Communist parties are often linked to socialist parties in terms of their advocacy for workers' rights and state-controlled economies. However, their historical difference with socialists dates to World War I, when some believed socialist parties were not strong enough in their opposition to the war (Beyme, 1985). The antiwar attitude unified many communist parties across European nations and led to the formation of a communist movement. This communist movement was much more ideological than other parties were, resulting in an outlook that was more international than national. Within older democratic systems, such as in France and Italy, communist parties have retained some influence, although their significance has waned in many other countries. In post-Communist states, the personnel of former Communist parties has remained in politics, although the parties themselves have undergone some changes, especially name changes. The former East German Communist Party became the Party of Democratic Socialism after unification and more recently transformed itself into the Left Party.

Christian democratic parties also originated before World War I. As some nations democratized, in some of the more religious nations, the established church found itself at odds with the secularizing tendencies of liberal reformers. Christian political parties were "generally formed as a defense counter reaction to liberal or secular legislations by which ardent believers felt threatened" (Beyme, 1985, p. 81). Only after the excesses of the national socialist era did established churches begin to realize the importance of democratic forms of government (Beyme, 1985). Accordingly, Christian democratic parties became popular in the post-World War era because their ideological orientation tended toward the center, especially economically, with a religious focus on moral issues.

Smaller parties such as *agrarian* or *regional* or *ethnic* parties are not as widespread as the previous party families are, owing to the particular historical circumstances of their formation. According to Beyme (1985), "Agrarian parties only emerged in countries where the towns were still relatively small during the period of the extension of the franchise and the rural population was strong enough to stand up to the major landowners" (pp. 112–113). The most successful agrarian parties have been in some of the Scandinavian countries. Agrarian parties tend to be to the right on political and social issues and were at their peak during the interwar period. Most have been subsumed by other parties.

Regional or ethnic parties also reflect a carryover from the nation-building process, and representation issues to

this day still divide the regional or ethnic minorities from the larger society. Most advocate for self-determination or autonomy in their own affairs. The most famous of these are the Basque Nationalist Party, in Spain, and the Scottish Nationalist Party, in Scotland. These parties advocate for the independence of the Basque and Scottish peoples from Spain and the United Kingdom, respectively.

The second half of the 20th century witnessed the emergence of political parties not traceable to the cleavages of national or industrial revolutions. The cleavages that would be politically relevant would be based less on redistributive issues and more on what Ronald Inglehart (1977) refers to as postmaterialist, or quality-of-life, issues. The emergence of *ecological* parties such as green parties marked the transformation of this cleavage into a political grouping. As opposed to other political groupings, green parties seemed to lack a particular social base of support and represented issues such as the environment, nuclear power, human rights, and democratic representation. These issues could not easily be placed within a traditional left–right understanding of politics and soon came to be known as issues of the *New Left*. Not surprisingly, the social and political developments that led to a New Left cleavage would also lead to a *New Right*, in which law and order, patriotism, and personal morality issues were similarly difficult to place within a traditional left–right understanding of political parties. Parties of the New Right are also referred to as right wing extremist parties or parties of the far right, but they share an emphasis on the above issues. The most famous of these has been the Front National of France.

Party Organizations

Political parties tend to differ in their organization on the basis of three factors: competition, institutionalization, and resource factors (Ware, 1996). *Competition* refers to ideological differences, as well as the way in which the party was formed. *Institutionalization* refers to the power relations both between parties and within parties. *Resources* refers to how the party perpetuates itself. Each of these factors is affected by the specific time in which a party emerges. Different organizational structures are thus related to specific social and political developments in the modern democratic state. Organizational differences become apparent when one observes what Richard Katz and Peter Mair (1993) term the different *faces* or responsibilities of political parties. The three faces are the party on the ground, the party in central office, and the party in public office. The *party on the ground* refers to the political party as represented by the electorate, or the voters a party can reasonably rely on to vote for it. The *party in central office* refers to the membership aspect of a political party, or those who actively participate within the party with respect to policy formation, recruitment of members, and campaign planning. The *party in public*

office refers to the members of a political party who serve as elected representatives.

The earliest political parties, known as *cadre*, or *elite*, parties, predated mass suffrage. Elite parties were small parties that largely reflected the interests of the elite classes. Because suffrage was limited, political representation of those who could vote was also limited—essentially narrow constituency groups, often locally based. The party in the electorate was indistinguishable from the party in public office because those elected to office came from local constituencies and directly represented voters. Organizationally, elite parties were not complex. A clear correspondence between voters and representatives existed, and local interests were well represented by the local representatives elected to national legislative bodies. Katz and Mair (2002) summarize the elite party as follows:

a small party on the ground in each constituency able to provide its own resources, close and locally based ties between the individual members of the party in public office and the individual parties on the ground, weak or entirely absent party in central office. (p. 116)

The extension of mass suffrage, well under way by the middle of the 19th century, not only coincided with emerging political ideologies representative of the interests of the working classes, but also led to the formation of *mass* parties. As Peter Mair (1990) writes, “The extension of [suffrage] incorporated the mass of the citizenry into the political system; mass parties mobilize and integrate these citizens and inculcate a set of enduring political identities” (p. 4). Mass parties are parties with a focus on national issues and thus on winning national representation. Unlike elite parties, mass parties depend on the maintenance of high levels of party membership. This is partly because of the need to attract votes and gain political representation but also because of the need to attract resources, most obviously financial ones. Elite parties, because of their small size, can rely on the support of wealthy backers, whereas mass parties need to appeal to large numbers of newly enfranchised working-class voters because mass parties need the dues of their members to remain financially solvent. As a consequence, the organization of mass parties is much more complex than that of elite parties. Katz and Mair (2002) describe the case of the mass party as follows:

The party in central office provides support for the expansion of the party on the ground and central coordination for its activities, while the party on the ground provides the resources that are necessary for the existence and success of the party in central office. (p. 117)

The necessity of coordinating activities between the party on the ground and the party in central office led to an increase in the importance of professional staff members. Adding to the necessity of strong organization is the importance of coordination with the mass party’s elected

representatives, or the party in public office. Not only are elected officials answerable to the constituencies that vote them into office, but they also must answer to the party in central office, responsible for the electoral activities of the party. With mass parties, the importance of party organization is evident in the need to coordinate between the three faces of the party, on the ground, in public office, and in central office.

Understandably, elite parties, which represented a narrow constituency, would lose relevance in democratic societies when the franchise was extended. According to Otto Kirchheimer (1966), mass parties themselves would also begin to fade after World War II as the societal cleavages that Lipset and Rokkan (1967) described lost some of their relevance. The political and economic development of the modern state made distinctions based solely on class or denomination less divisive. Along with social and political changes within the electorate, political parties themselves changed, now with an increase in emphasis on winning elections and gaining seats in national legislatures. To win elections and gain seats, political parties needed to broaden their appeal past the narrow clienteles of the elite parties, or even the specific class-based focus of the mass parties. Some political parties developed a *catchall* approach, in which the aim was to catch all categories of voters, not just traditional constituencies based on societal cleavages. Ideological considerations were less important than not alienating a particular constituency group. Catchall parties would appeal to the median voter in society as opposed to a specific section of the electorate.

Organizationally, the catchall party differed from the mass party model on many fronts. New forms of media, such as television, made the activism associated with mass parties less of a crucial element for catchall parties. Rather than extend the effort involved in appealing to voters through personal contact and activist organization, political parties found that they could appeal to more voters through the media. It is important to note that the reach of the media also meant that catchall parties would emphasize the recruitment of party leaders who could appeal to the widest swath of voters. For the first time, the party in public office and the party in central office would be the most important faces of the party, as opposed to the party in the electorate and party in public office faces of elite parties and the party in the electorate and party in central office faces of mass parties. Catchall parties were formed specifically to win elections, and the way to do so was under the direction of a central office charged with the responsibility of running election campaigns and choosing the best representatives, from the point of view of the party, to stand for them.

Changes in political party organization echo changes in society and in politics. Modern political parties have placed more importance on winning elections, even though the importance of party membership has decreased. Catchall parties found they could win elections by appealing to the widest possible bloc of voters. At the same time,

voters have become less likely to identify with a specific political party and more likely to shift their allegiances from election to election. With shifting voters comprising an ever larger proportion of the electorate, political parties are less likely to rely on voters for resources. Katz and Mair (1995) suggest a new type of party has emerged that has adapted to these realities: the *cartel* party. Cartel parties are characterized as comprising professional politicians whose main source of support is actually the state and public sources of financing for political parties. Although political parties may compete against each other for votes and seats, all implicitly understand that their survival depends on maintenance of office rather than ideological battles. Katz and Mair write that “as politicians pursue long term careers, they come to regard their political opponents as fellow professionals” (p. 23). The party in public office is the most important facet because elected officials both attract votes and make sure that sources of public funding remain in place for themselves.

Party Systems

Both the competition and the prospects for cooperation between political parties in an electoral system constitute a *party system*. Party systems may differ on the basis of the types of parties within a system (both ideological and organizational) and the number of parties within a system. Which parties are included as part of a party system is decided on the basis of what Giovanni Sartori (1976) terms *coalition potential* and *blackmail potential*. *Coalition potential* refers to whether a party can be considered an acceptable coalition partner in order to control government. This definition does not imply that a party has to be in government to be considered a party of the party system, but rather that it has the potential to be part of a governing coalition. *Blackmail potential* refers to whether a party can affect the tactics of party competition of the parties that have coalition potential. This definition does not imply that a party must be part of a coalition, or have any chance of being part of a coalition, but that it can influence the political parties that do have coalition potential.

Early observers of political party systems such as Maurice Duverger (1951/1954) held that the number of parties within a system should be the main criterion for defining a party system. The number of political parties within a party system is largely dependent on the specific election rules of that political system. By *election rules*, Duverger meant the barriers to representation, or what percentage of the vote a party must secure in order to be represented in the national legislative body. The main difference is between systems following majoritarian representation rules and those following a proportional representation rule. A *majoritarian* system is one in which a party (or its candidate) must secure more than 50% of the popular vote. This type of system is also commonly referred to as a *first past the post* system, with *the post* referring to 50% of the vote: The party

that first gets 50% of the vote gets representation. Majoritarian systems tend to limit the number of parties that compete in these systems because the parties must necessarily appeal to the widest range of voters. Were a party to appeal only to one or the other side of the political spectrum, it would only have the votes of a minority of voters. Thus, Duverger held that majoritarian systems tended to be two-party systems, with the parties themselves more moderate in their political ideologies because of the necessity of having to appeal to a wider group of voters. Two-party systems tend not to have cooperation between the major parties, given that one party necessarily has a majority of the seats in the legislative branch and thus does not need the opposing party to form policies. The United States is one of the most notable two-party systems.

Political systems that follow *proportional* representation tend to have a greater number of political parties because parties will win seats in the national legislature based on their percentage of the popular vote. Some systems, such as Germany, have instituted minimum-vote percentages, which lower the probability of extremist parties' gaining representation because parties must win at least a specific percentage of the vote to gain seats. In political systems in which there is a minimum-vote threshold, the mean number of political parties tends to be lower than in systems in which there is no minimum-vote threshold. Even so, there is no standard number of parties within a multiparty system. *Two and a half party systems* are systems that have three parties, with the third party much smaller than the other two. Australia and Canada are notable two-and-a-half-party systems. The third party tends to alternate as a coalition partner between the larger parties, although a *grand coalition* between the larger parties is not unheard of. In a *system with one large party and several smaller parties*, the larger party tends to be in power for long periods, with a coalition of the remaining parties necessary to unseat the larger party. The party systems of Norway and Sweden exemplify this type of system. *Systems with two larger parties and several smaller parties* necessitate the formation of coalitions between the larger parties and some, or several, of the smaller parties. In this case, a grand coalition between the larger parties is unlikely because of ideological distance. Israel can be said to illustrate this type of system. Finally, *even multiparty systems* consist of a broad category of multiparty systems that can range from systems in which there is complete cooperation between the parties to polarized and volatile party systems (Ware, 1996). Italy in the postwar era was long the main example of this type of system. The number of parties in a system is not sufficient in itself to describe the nature of the party system; the nature of party competition is an important component in the classification of party systems.

Following Duverger, Sartori (1976) suggested that ideological distance, as well as party fragmentation, determine the nature of party competition within party systems. *Ideological distance* is defined as the “overall spread of the ideological spectrum of any given polity” (p. 126). At the

time of Sartori's work, this primarily referred to parties aligned along a traditional left–right continuum. Ideological distance also refers to the attitudes of political parties toward the state, as well as toward other parties within the system. Thus, political parties may be close ideologically but differ in how they perceive themselves in relation to the state and to each other. Extremist parties, although having similar ideological tendencies as parties of the left or the right, may nevertheless be considered ideologically distant if their ideology incorporates antisystem tendencies.

Party fragmentation incorporates the number of parties within the system and whether any of the parties “approaches the absolute majority point” (Sartori, 1976, p. 124). The more parties within a party system, the more likely it is that a party system will be fragmented, especially if there is a large ideological distance between the parties. A large number of parties plus a large ideological distance between the parties can result in what Sartori refers to as a *centrifugal system*. A centrifugal system of party competition is one in which most parties exist at the extremes of the system, with a vacuum in the political center of the system. Conversely, a *centripetal system* of party competition displays a pull to the center for the political parties and is much more likely in systems with smaller numbers of political parties.

When party fragmentation is taken into account, the classification of party systems becomes more complex. Two-party systems tend to have lower levels of party fragmentation in general, although Sartori (1976) warns not to assume that they “always work.” Rather, Sartori suggests that the “centripetal mechanics of twopartism creates consensus” (p. 191). In a *predominant party system*, in which one party has the majority of votes although other parties are represented in the system, as long as the predominant party retains the majority of seats, party fragmentation is also low. Japan in the postwar era is an example of this. However, should the predominant party lose an outright majority, the system may change into one in which party fragmentation is higher.

Moderate multipartism describes party systems of about three to five parties, with moderate levels of party fragmentation and centripetal tendencies within the system. That is to say, the parties are pulled toward the center. In contrast, *polarized multipartism* describes party systems with about three to five parties and centrifugal tendencies. The center is weak in such systems, which are more likely to suffer instability. Societies that have deep cleavages within them, and many parties to represent these cleavages, tend to display *segmented multipartism*. Although the political tendencies are centrifugal, or a lack of center exists, such systems can endure through institutional design. The best examples of segmented multipartism through institutional design are the consociational democracies such as the Netherlands, described by Arend Lijphart (1969).

Party systems are defined through the prospects for party competition and party cooperation in a political system.

Party competition is a straightforward concept; parties compete with each other for votes and seats in a legislature. Party cooperation, however, has a slightly different focus in that it describes how parties interact with each other after receiving votes and seats in a national legislature. Levels of party cooperation are determined by the willingness with which parties will go into coalitions in the formation of a government. In a predominant party system, or a two-party system, party cooperation is not a necessity as one party has a majority of the votes and seats. However, in party systems with more than two parties, coalitions are a necessity in order to form a government because there is no clear majority party. The extent to which political parties can cooperate in the formation of a ruling coalition is dependent on various factors and is the subject of the following section.

Formation of Government

One of the functions separating political parties from other interest groups in society is the translation of issue preferences into policy. Ian Budge and Hans Keman (1990) suggest that contrary to some conceptions of political parties, winning elections is not the most important goal for political parties; formulating policy is. Per Budge and Keman, “explaining the behavior of parties in government is a natural corollary to explaining how they gain the popular support necessary to sustain a governmental role” (p. 2). Without the ability to translate preferences into policy, political parties would not have support from the electorate. Thus the extent to which parties can make or influence policy is a key determinant of their longevity within a political system.

Within majoritarian political systems, the party that receives the most votes forms the government because it controls the most seats in the legislative branch. In multi-party systems, the formation of a government is much more complicated. Budge and Keman (1990) offer a general theory of party government to explain the factors influencing the party coalitions that may form when no one party controls a majority of votes. According to Budge and Keman, this general theory has four assumptions:

1. The party or combination of parties that can win a legislative vote of confidence forms the government.
2. Parties seek to form a government that can survive legislative votes of confidence and most effectively carry through policy.
3. The chief preferences of all democratic parties is to counter threats to the democratic system; where no such threats exist, the chief preference is to carry through differences related to issues along the socialist bourgeois¹ dimension of issue competition; where these two threats do not hold, the preference is to pursue group related preferences.
4. Within parties, factions seek to transform their issue preferences into policies.

The implications of this general theory of party government affect explanations of party behavior, how governing coalitions form and how they change, what governments do in terms of their policy outputs, and how governments come to an end. The formation of governments refers not only to which parties are part of the ruling coalition but also to how government ministries are distributed among the coalition partners. In fact, Budge and Keman (1990) suggest that parties may influence government more through their tenure of specific ministries than through the negotiations that lead political parties into coalition.

The coalition process begins when it becomes apparent that no one party has enough legislative seats to control the government. William H. Riker (1962) suggested that the most obvious coalition to form would be a *minimal winning coalition*, in which there are enough members within the coalition to assure control of government, but no surplus members. This approach explains the behavior of political parties if their main goal is the maintenance of office but does little, according to Budge and Keman (1990), to explain the formation of policy. A policy-based approach to explaining coalition formation may be better at “explaining why governments adopt the kind of policy they do” (p. 19) and ultimately how responsive elected governments are to voters.

In forming coalitions, then, parties take into account the seats held by other parties within the system, as well as the policy positions of all parties within the system. Coalitions tend to form on the initiative of the largest parties within the system (Budge & Keman, 1990). Parties are more likely to enter into coalition with other parties that share the same policy preferences as they do and that have enough legislative seats to form a coalition of at least 50% plus one of all legislative seats. Policy positions are not static; they can change, given historical situations, which implies that particular coalitions are not necessarily a given. Nevertheless, parties will enter into the coalition that they figure will provide the best possibility of implementing their policy preferences, and they do so based on a calculation of policy preference overlap between the parties within a system. The more overlap in terms of policy preference, the more stable over time the coalition will be. Coalitions can form in the absence of policy overlap; in more fragmented systems, prosystem attitudes may be enough to enter into coalition, although these coalitions tend to be the least stable over time. Generally speaking, the smaller the coalition, the more stable the coalition tends to be.

Coalition agreements specify not only which parties will control the government but also which ministries are held by the specific coalition members. Generally, the largest coalition member holds the prime ministry, with other ministries allocated on the basis of the policy interests of the specific coalition members. The most likely scenario is one in which the number of ministries held by a coalition partner reflects the proportion of seats it holds within the coalition (Budge & Keman, 1990). In a broad sense, the policy priorities of political parties will differ by

political families, so the distribution of particular ministries is somewhat predictable from the party family of a coalition partner. For example, an agricultural party would reasonably be expected to retain the ministry of agriculture within a coalition. If there are potential conflicts between coalition members over ministries, the parties will bargain over ministries until the ministries have been allocated to reflect the proportional distribution of seats held by the coalition members.

In their examination of coalition formation and government functioning in 20 states over time, Budge and Keman (1990) noted a correspondence between parties and the policies that governments made, with parties clearly moving “policies in the direction of their own preferences and values” (p. 158). The importance of policy also plays a role in the termination of governing coalitions; when there are policy differences between coalition partners, the termination of a governing coalition is more likely to take place. A single-party government tends to last longer than governing coalitions because of the absence of policy difference. However, the single most important cause of the termination of government is in fact an election. Voters ultimately decide on the longevity of a government. If they do not like the policies of a government, they are more likely than ever before to vote against the parties of a governing coalition. An overall trend of less stable voting patterns among voters is a major factor in this development.

Decline of Parties

Party identification is defined as a long-term psychological identification with a particular political party (Campbell, Converse, Miller, & Stokes, 1960) and has long been one of the most reliable indicators of the individual vote. If a voter identifies strongly with a political party, the voter is likely to vote for that party in an election. Political partisanship is primarily transmitted during childhood; children will imitate their parents in terms of the political parties they identify with, and this identification lasts well into adulthood. Family is not the only agent of socialization; education, occupation, and social networks serve as alternative venues in the transmission of political partisanship. Although party identification can be influenced by social demographic factors, ideological and issue orientations play a role in the identification of a voter with a specific political party. Party identification has a central role in the study of democracies because political parties provide a linkage for the voters with their government. Political parties can serve as an information cue for voters in elections by educating voters on political issues and candidates, and political parties can mobilize voters to vote in elections.

The discovery of a decline in the percentage of citizens identifying with a specific political party at the end of the 20th century has led to some concern. Initially, partisan *realignment* was thought to be taking place because of

fluctuations in elections in the 1970s and 1980s (Dalton, 2008). Voters were not voting consistently for the same parties over election cycles, as they once had. *Partisan realignment* is the conversion, or realignment, of large numbers of voters from one political party to another political party. Public opinion research supported a different argument: Voters were not realigning themselves, but instead were displaying *dealignment*, or an erosion in party loyalties. The evidence for dealignment included a decrease in party loyalty, lower levels of confidence in parties as political institutions, and an increase in the percentage of voters who not only shifted their votes from election to election but also waited longer to make their choices (Dalton, 2008).

The sources of voter dealignment are said to range from a decrease in the importance of sociopolitical cleavages to changes in the mass media and to changes in political parties themselves (Dalton & Wattenberg, 2000b). The *modernization hypothesis* put forth by Ronald Inglehart (1997) suggests that socioeconomic changes after World War II have led to higher levels of education and standards of living, which have led to an erosion of group-based politics based on class. If the cleavages in society that led to the formation of political parties no longer apply, then the relevance of these parties would also seem less applicable. Higher levels of education, coupled with changes in the mass media, also play a role in partisan dealignment. If the mass media have assumed many of the information functions that political parties once performed (Dalton & Wattenberg, 2000b), then it stands to reason that parties would lose some of their relevance. Finally, changes in political parties themselves, such as an increased emphasis on candidates over party ideology, have led more people to vote on the basis of specific issues and candidates, which further decreases the relevance of political parties.

Kay Lawson and Peter Merkl (1988) suggest that major “parties fail when they do not perform the functions they are expected to perform in their own society” (p. 5). The emergence of interest groups, single-issue movements, and different forms of political organization as motors of interest aggregation—one of the primary functions of political parties—serves as further evidence of party decline. In some systems, parties may fade away, while in other systems, new parties based on political movements may emerge. Party decline is not a uniform phenomenon but is influenced by the type of political system in which the party is located. Even so, Lawson and Merkl note that although there is evidence of party decline, the persistence of political parties in general suggests the continued relevance of political parties, although in different ways.

Implications for the Future of Parties and Party Systems

Dalton and Wattenberg (2000a) indicate that political parties have made adaptations in the face of evidence of their

decline. The emergence of cartel parties is one example of party adaptation. Dalton and Wattenberg further suggest that “parties are benefiting themselves (financially and electorally) at the expense of some of the functions that have made them so essential to the democratic process, such as socialization, mobilization and representation” (p. 269). Given that voters have a declining propensity to identify with the same party over time, and an increased propensity to change their identification from election to election, this loosening of the linkage between parties and voters leads to higher volatility within the electorate. More distressing to Dalton and Wattenberg is the possibility that parties may become less responsive to voters because of the decrease in ties to voters: “If organizational maintenance becomes a party’s primary goal, democracy will inevitably suffer” (p. 270).

Even so, the emergence of cartel parties, which may block the emergence of new parties as challengers within the political system, may not stem all democratic opposition or democratic representation. That is, cartel parties may limit competition among themselves but are unable to limit political opposition and challenges from outside the cartel (Katz & Mair, 1995). Referring again to Lawson and Merkl (1988), the emergence of social movements and single-issue groups suggests that interest articulation is alive and well in democratic societies. Although it is the case that there are lower levels of partisan identification in the electorate and lower levels of trust in political parties, some suggest that these developments reflect another stage in democracy itself (Dalton, 2008). Higher levels of education and cognitive mobilization have led to more politically sophisticated citizens who are even more likely to participate politically, although not through political party mechanisms.

Throughout much of the literature on political parties and political party systems, a common theme has been that of change. Over the stages of democratic development, we see that there have not been single types of parties in specific periods but rather many different types of political parties over extended periods. The organizational forms of parties tend to reflect changes within the broader system, be they ideological shifts, organizational shifts, or even shifts in the competitive framework. An example of this was seen in the transition from mass parties to catchall parties based on technological and social changes. Ideological shifts also take place over time; a party such as the Austrian Freedom Party was considered an example of a liberal party in the 1960s and 1970s but by the end of the 1980s was considered to be more an example of the New Right (Cole, 2005). As political parties remain part of the democratic framework, they must necessarily adapt to account for a greater proportion of the electorate with lower levels of partisanship but higher levels of political sophistication. This need may imply further changes in party organizations, or it may reflect different ideological orientations. It may also mean the fading of

parties from party systems or the inclusion of new parties in party systems. Much as the formation of political parties and party systems reflected political conditions at their founding, transformations of parties and party systems reflect political conditions. This is perhaps the only constant in an area of study that is based on constant change.

Note

1. "Socialist bourgeois dimension" refers to politics along a left right continuum, with the continuum reflecting socioeconomic policy preferences. Socialist policies exist on the left side of the continuum whereas bourgeois, or capitalist, policies exist on the right side of the continuum. Budge and Keman (1990) suggest that the "clash between traditional and innovative societal values" can also be placed on this continuum (p. 20).

ELECTORAL SYSTEMS IN COMPARATIVE PERSPECTIVE

WILLIAM M. DOWNS

Georgia State University

Elections are central to the functioning of democratic systems, and as such they have been the focus of extensive political science research for centuries. Scholars and practitioners seek to understand the variation in choices of different electoral systems cross-nationally. They also try to isolate the impact of those choices on a range of individual-, institutional-, and system-level outcomes. Those outcomes include the quality and breadth of representation; size and polarization of political party systems; citizen participation and voting behavior; and government, as well as system, stability. Much of the research conducted on electoral systems and elections has evolved from theoretical and empirical work on the United States and other established Western democracies (especially those in Europe), but considerable effort in recent decades has been devoted to understanding elections in transitioning and new democracies globally. Although elections do take place in nondemocratic polities, they usually fail to be free, fair, or competitive and therefore typically fall outside the domain of comparative research. What is clear is that the increasing sophistication of theoretical and statistical tools available to political scientists (along with an expanding universe of cases against which to test expectations) has resulted in important advances in our understanding electoral systems and elections. Because electoral processes and outcomes exert such profound effects on the real world of

politics, such understanding is an example of the crucial connection between theory and practice in political science.

A first level of comparison identifies the different types of elections designed to determine national executive power. Presidents and other chief political executives may be elected through *direct* or *indirect* means. In direct elections of presidents and presidential-type executives, voters cast ballots for one of the eligible candidates. A candidate can win outright in a single round of voting by garnering an absolute majority of the ballots cast; however, when no one candidate captures 50% plus one of the eligible votes, a runoff round is held at a subsequent date, with the top two finishers from the first round squaring off. This model of direct executive election (exemplified by countries such as France, Russia, Poland, and Argentina) has the putative advantage of providing a wide range of candidates from which voters may choose in the first round. If a second round proves necessary, the system then yields a winner supported by an absolute majority of those turning out for the runoff. Indirect election of a country's president or other executive leader, alternatively, entails voters' selecting other persons (*electors*), who will then determine the winner. The United States, for example, uses an indirect mechanism whereby voters choose presidential electors, who then comprise the *Electoral College*, which then votes on who will become the next president. That process

leaves open the possibility that the person chosen to be president by the Electoral College is not the same person who secured the greatest number of votes among the general population. Elsewhere, directly elected parliaments (either an upper house or both houses in joint session) constitute the arena in which presidents are indirectly selected; this occurs in Germany and Italy, for example. When *Westminster style* parliamentary systems (i.e., those modeled after the British House of Commons) use votes by legislators in plenary sessions to approve (or remove) prime ministers as heads of government, they are engaging in indirect elections of political executives. Taking the selection of national leaders out of the direct control of voters represents the skepticism that constitutional architects have for the general population, and it can provide an apparent elite-level check on the sentiments of mass electorates.

The second major dimension along which political scientists compare elections is the method of voting for legislative assemblies. Indeed, examining legislative elections across countries reveals considerable variation in such key dimensions as district magnitude, electoral formulae, ballot structure, and the use of electoral thresholds. *District magnitude* refers to the number of candidates who will be elected to a legislature from any given constituency, and the basic distinction here is between systems that rely on single-member districts and those that employ multimember districts. District magnitude is usually studied in tandem with the system's chosen *electoral formula*, which represents the particular mechanism for translating votes into legislative seats. Such mechanisms are most frequently of the plurality, majoritarian, and proportional varieties. In the single-member district system, a country is divided into discrete electoral districts from which one individual will emerge as the elected representative. This system normally relies on a plurality rule, meaning that the candidate with the most votes wins (regardless of whether that candidate has captured an absolute majority). As such, single-member district systems are often deemed *first past the post* systems and also constitute a winner-take-all approach that provides no electoral prize for coming in second. The United States and the United Kingdom are among the countries where the single-member plurality system has a long-standing history; however, a range of countries elsewhere—including Canada, Ghana, and India—have adopted the same method. Others, most notably France, employ a single-member district system with two rounds of voting. In such cases, individual candidates can win outright in the first round with an absolute majority of votes cast, or they can secure the plurality of votes cast among eligible candidates in the second-round runoff. Single-member district systems are defended by their advocates as those that can enhance clarity of responsibility and democratic accountability by giving citizens in each district one individual to whom credit or blame can be assigned. The clarity and accountability that are supposed to accompany majoritar-

ian governance should, according to this logic, produce more stable and effective polities. Detractors, however, find that aggregating district-level winner-take-all elections into a national whole can produce skewed representation in the legislature. For example, a party that runs a consistent and respectable second place throughout the country but that fails to win any single district would be excluded from taking seats in the legislature. Such a system, then, has the potential to underrepresent small parties in a democracy.

The alternative to single-member, winner-take-all systems of electing representative assemblies is one based on proportional representation (PR) in multimember districts. In PR systems, the goal is to have the percentage of a party's seats in the legislature reflect the percentage vote share captured by that party in the general election. The party securing 25% of the vote would, accordingly, be rewarded with 25% (either exactly or approximately) of the legislative seats. Here *ballot structure*, which shapes how voters cast their votes, becomes critically important. Ballots can be *categorical* or *ordinal*. The categorical ballot structure allows a single either-or choice of one candidate. By contrast, the ordinal ballot structure gives voters the opportunity to vote for more than one candidate. In some ordinal ballots, political parties devise rank ordered lists of candidates to determine which persons ultimately claim those seats. In this *closed party list system*, citizens vote only for a party in a multimember constituency (often the whole country), whereas in an *open party list system*, voters can choose from a published list or select an individual candidate. The closed party list mechanism clearly vests considerable power in the hands of party leadership. Often, PR systems will set a minimum threshold (5% in Germany, for example) that parties must clear in order to win seats. *Electoral thresholds* are an increasingly common way for PR systems to limit the entry of minor (and sometimes extremist) parties into legislatures. Thresholds normally require a minimum percentage of votes or a minimum number of seats in order for a party to gain seats in a legislature. Thresholds vary, with some countries opting to set the bar low (Israel, for example, at 2%) and others raising it to high levels (e.g., Turkey, at 10%). Numerous varieties of proportional representation exist, each with different counting and procedural mechanisms. One such variety is the *single transferable vote* method. By this method, voters rank candidates preferentially, and if a voter's first-choice candidate has already cleared a set threshold and does not need additional support to win, then that vote is transferred to a second choice. This process, exemplified most clearly by Ireland, is designed to avoid "wasting" votes.

Although there is a tendency among political scientists to classify electoral systems in democratic countries into either the majoritarian or proportional camp, the reality is that many hybrid or mixed systems exist in between those two types. The *additional member system*, for example, combines elements of conventional first-past-the-post

systems with some characteristics of party-list proportional systems. In this combination, voters get two votes: The first helps allocate seats to single-member constituencies, and the second goes to a party list. The percentage of second or party-list votes won by a party determines the party's overall number of representatives, and the number of seats won in single-member districts is "topped off" to match that overall percentage. This method finds use in elections to Germany's Bundestag, New Zealand's House of Representatives, and the Scottish and Welsh Assemblies in the United Kingdom. The presumed advantage of this *mixed member system* approach is that proportionality is ensured, and at the same time, a directly accountable representative for each constituency is also identified. It is also said to allow strategic voters to express support for an individual politician while not necessarily endorsing that candidate's political party. Disadvantages are said to include the creation of two (potentially unequal) classes of politicians, with those elected under the second-ballot topping off beholden not to the voters but to party leaders instead.

While elections in democratic settings constitute the overwhelming preponderance of all voting processes studied by political scientists, it is important to note that nondemocratic systems (e.g., authoritarian and semiauthoritarian systems) can also employ electoral mechanisms. Such regimes may organize controlled and uncontested elections as a means of mobilizing mass endorsement of a national leader or a single-party legislature. Doing so can provide symbolic legitimacy for the ruling elite, and it may neutralize popular discontent by creating the false appearance of citizens having a say in the affairs of their country. For example, while the Communist Party monopolizes power and controls political processes in China, direct elections of village-level offices do take place, as do indirect elections for people's congresses above the local level. The one-party Soviet Union held its own brand of uncontested elections, as did Iraq under Saddam Hussein. Brazil under military rule orchestrated compulsory voting in tightly controlled elections, even though the frequency of blank and spoiled ballots often suggested popular rejection of the process. Semicompetitive, hegemonic party systems such as Egypt's hold elections in which there is little *a priori* uncertainty of the outcomes; there is, in such cases, some element of choice and voter expression. Although nondemocratic variants of the electoral process illustrate more about a regime's methods of system control than they do about representation, responsiveness, and accountability, they clearly merit attention.

Theory

Some democratic theorists view elections as a central—if not *the* central—component of liberal democracy.

Indeed, in this view, elections constitute the minimum necessary requirement for democracy. For Schumpeter (1942), democracy is "that institutional arrangement for arriving at political decisions in which individuals acquire the power to decide by means of a competitive struggle for the people's vote" (p. 269). Likewise for Huntington (1993), democracy is defined most essentially by the fair and periodic voting procedures that select a country's leaders. Przeworski, Alvarez, Cheibub, and Limongi (2000) also view contested elections—that is, those in which there is *ex ante* uncertainty and *ex post* irreversibility—as the litmus test for democracy. Others, such as Dahl (1971), counter that such a thin, minimalist, or procedural definition of democracy-as-elections fails to account for other necessary conditions, such as the protection of civil liberties and the actual responsiveness of government policies to voter preferences. Whether sufficient or not, elections typically figure as necessary conditions for the existence of democracy.

Theoretical work on elections and comparative electoral systems has largely focused on (a) the relationship between electoral rules and the size and polarization of political party systems, (b) the tendency of certain electoral systems to impact voter turnout and citizen participation, (c) the congruence between electoral verdicts and government policy, and (d) the potential for electoral systems to predispose new or transitioning systems to success or failure. Political scientists developing theory in each of these areas represent some of the main ontological camps in the discipline, such as structuralists, rationalists, and culturalists. As such, attention has been devoted to formal rules, voter preferences and behavior, and the contextual influence on system choice and outcomes.

The causal relationship between electoral rules and the nature of a country's political party system has animated scholarly interest for decades. Perhaps the most famous proposition, tested repeatedly since its early assertion by Duverger in 1954, is that plurality elections using one-ballot single-member districts will favor the creation of two-party systems whereas proportional representation rules with multimember districts will lead to multiparty systems. Duverger went further to posit that a majority vote on two ballots increases the likelihood of a multiparty system as well as the necessity of postelection coalition formation. It is rare indeed that causal relationships in political science theory elevate to lawlike status, but in this case, "Duverger's Law" has achieved considerable staying power. The logic guiding Duverger's assertions depends on what are conventionally deemed *mechanical effects* and *psychological effects*. The mechanical effects highlight the underrepresentation of third (and fourth, and fifth, etc.) parties, which is likely to occur over time in a single-seat legislative district requiring an outright plurality or majority vote. Given the mechanical impediments to minor party success, voters who support minor parties then have psychological incentives not to "waste" their votes and may often cast

ballots against their preferred candidate in a strategic effort to exercise some influence over the most likely winner in the two-party competition. Such claims have spawned much subsequent work, and not a little dissent. Sartori (1968) extended Duverger's assertion of a link between proportionality and party system size, specifying that district magnitude (i.e., the number of seats in a district) is the single best predictor of the effective number of political parties in a district. Riker (1982) challenged Duverger's hypothesis about PR and multipartism by contending that, if true, we should see a recurring increase in the number of parties over time rather than party system stability or modest decreases in the effective number of parties (as most frequently occurs in practice). Debate over the relationship between choice of electoral system and party system size is important, given the propensity to view two-party majoritarian countries as more stable than those with polarized multipartism.

If electoral rules biased in favor of two-party systems are theorized to bring gains in terms of system stability, then those rules favoring proportionality figure prominently in political science theories that attempt to explain citizen engagement, voter turnout, and representativeness of legislatures. According to Lijphart (1994, 1999), majoritarian and plurality electoral systems dilute citizen enthusiasm and voter turnout because so many supporters of minor parties conclude that casting their ballots will have little to no impact on electoral outcomes, government formation, or policy choices. Conversely, proportional systems with low thresholds for representation and large district magnitudes should increase the chances that smaller parties from across the ideological spectrum will be able to secure voice and seats in the legislature. With that greater likelihood of electoral success for minor and even fringe parties, voter efficacy and incentives to cast ballots should be increased. Voter turnout is "an excellent indicator of democratic quality" (Lijphart, 1999, p. 284), and PR systems are theorized to be superior to their majoritarian counterparts in generating democratic gains in this area. As part of an overall inclusive and consensual approach to democratic governance, proportional electoral systems should also improve citizen satisfaction with the political system, *ceteris paribus*.

A third major area of theoretical work on comparative electoral systems has evolved around the presumed correspondence between voting outcomes and public policy. If democracies are to be responsive to the preferences of the public, then periodic voting should work to translate the "will of the electorate" into identifiable policy choices. Scholarship in this area builds on the majoritarian-proportional dichotomy to examine citizen control over—and influence on—government policy making. Powell (2000) explores elections as "instruments of democracy" and distinguishes a proportional vision of "citizen influence" from a majoritarian vision of "control." He contends that "proportional influence designs enjoy a surprising

advantage" (p. 18) over the majoritarian alternative because they encourage broad cross-party bargaining to form a government and to pass legislation. Such bargaining should produce governments that include the *median legislator*, who is, in turn, close to the *median voter*. The median voter is located at the middle of a political system along most issue dimensions, such that one half of the electorate is positioned to the political left and the other half is positioned to the political right. The median legislator is likewise the elected representative located such that half of the other legislators are to the left and the other half are to the right, politically. Electoral systems that produce governments proximate to the median voter should, therefore, be more responsive to policy preferences. Proportional electoral systems should also give greater policy influence to opposition parties, making for a more inclusive process of policy making.

Theories underpinning our understanding of electoral rules and their consequences can have extremely important practical applications. While much effort is devoted to understanding how and why established democracies tinker with their electoral systems to enact reforms or alter a range of political outcomes, even greater attention has been directed in recent decades to the role of elections in facilitating regime change. Indeed, one of the growth areas in political science literature addresses the prospects for successful *electoral engineering*. Given that the last decades of the 20th century witnessed transitions from communism, apartheid, and other forms of autocratic rule, alternative theories about the prospects for implanting democracy through institutional engineering have become increasingly salient. Likewise, nascent postauthoritarian systems in early 21st-century hot spots such as Iraq and Afghanistan have emerged as testing grounds for the discipline's theoretical assertions. Norris (2004) identifies two theoretical traditions—*rational choice institutionalism* and *cultural modernization*—that purport to explain the possibilities for electoral engineering on human behavior. In the rational choice institutionalism approach, political parties adopt discernibly different strategies based on the nature of electoral thresholds and ballot structures. Preference-maximizing citizens likewise should be expected to respond differently to alternative electoral rules. If correct, this logic would predict that rule-based incentives will shape consistent patterns of behavior; therefore, changing those incentives through electoral engineering "should have the capacity to generate important consequences for political representation and for voting behavior" (Norris, 2004, p. 15). By contrast, the cultural modernization approach suggests that deep-rooted cultural habits arising from processes of social modernization place real limits on the potential of formal rules to alter behavior in systematically meaningful ways. This culturalist argument is often employed to explain why wholesale introduction of electoral rules into culturally divided, postconflict settings so

frequently fails to produce short-term transformations of individual behavior.

Applications and Empirical Evidence

Political scientists have endeavored to assemble an abundance of empirical evidence in support of their theoretical claims. Perhaps nowhere has greater effort been extended than in tests of propositions about the linkages among electoral laws, party systems, and coalitional incentives. Countering an alternative hypothesis that underlying societal cleavages are the primary agents determining size and polarization of party systems, a literature has evolved (cf. Cox, 1997; Lijphart, 1994; Rae, 1967; Riker, 1982; Sartori, 1968; Taagepera & Shugart, 1989) to contend that electoral laws have their own independent effects. Duverger's notions about first-past-the-post, single-ballot elections tending to produce two-party majoritarian systems find extensive application in the United States, as well as the United Kingdom. In elections for the U.K. House of Commons and the U.S. Congress, the evidence seems to suggest a compelling link between electoral rules and strong, stable, two-party government. Electoral structures in the United States, for example, help explain the consistent failure of third parties to mount successful campaigns. This winner-take-all system has, though, placed such significant importance on the drawing of district boundaries that the pernicious practice of *gerrymandering*—consciously redrawing the lines to ensure a majority for one party—emerged as part of American politics. Although smaller parties have been able to win parliamentary seats in the United Kingdom, their ultimate representation in the House of Commons is highly disproportionate to their overall support in the electorate, and they have little chance at becoming the party of government or forcing a coalition. To illustrate, the perennial third-party Liberal Democrats won 22.1% of the vote in Britain's 2005 general election but secured only 9.6% of the 646 seats in the House of Commons. Tony Blair's Labour Party, having won only 35.3% of the votes nationwide, nevertheless captured 55.2% of the seats in parliament and 100% of the cabinet positions in government.

Single-member-district plurality systems normally provide rapid certainty after an election about who will govern and who will constitute the opposition. However, systems that introduce even a modicum of proportionality likewise introduce an element of uncertainty into the government formation process. Proportionality (especially when combined with low thresholds in multimember districts) does increase the number of effective parties in the political system. When no single political party secures an outright legislative majority, the postelection period becomes one marked by formal negotiations as well as backroom deals between parties jockeying to join a governing coalition. The case of Belgium is illustrative. There

a proportional representation system with compulsory voting and a 5% threshold for representation in the federal Chamber of Representatives produced enough support to grant parliamentary seats to 11 parties in the June 10, 2007, general election. The largest among those, the Christian Democratic and Flemish Party, claimed only 18% of the 150 seats in parliament and could therefore not form a government by itself. Protracted negotiations commenced after the election, and 196 days later, the best the Belgian parties could do was constitute an interim caretaker government. That interim government lurched along, with further negotiations taking another 79 days before the parties could agree on a full-fledged new government. That government, in turn, failed to finish out the year. Although electoral rules biased in favor of majoritarianism typically yield governments that combine certainty with disproportional representation, those rules favoring multiparty outcomes tend to better reflect the dispersion of political preferences throughout the country but may also add considerable uncertainty to the government formation process.

Evidence also exists on the relationship between electoral systems and the production of such democratic goods as high voter turnout and citizen satisfaction. Where the electoral rules reduce the costs (e.g., time and effort) to citizens of registering and voting, we should find greater turnout. Similarly, where party choices available to voters are more extensive we should expect to see elevated turnout. Finally, voter efficacy—the belief that casting a ballot can actually impact the government formed and the ultimate policy direction taken—should be directly related to turnout at elections. According to Norris (2004), “Institutional rules do indeed matter: voting participation is maximized in elections using PR, with small electoral districts, regular but relatively infrequent national contests, and competitive party systems, and in presidential contests” (pp. 257–258). There is also evidence to support theoretical contentions that the type of electoral system can impact the opportunities for women and minorities seeking to earn a legislative seat or executive office. Among established democracies, the countries that consistently sit atop comparative rankings of the proportion of women winning seats in national parliaments are Sweden, Iceland, Finland, and the Netherlands. Each country employs some form of proportional electoral rules with low thresholds, and in each it is routine for women to constitute more than 40% of national parliamentary representation. Findings such as this, it should be noted, must also take regional political culture and other potentially intervening factors into consideration.

In his study of democratic performance in 36 countries from 1945 to 1996, Lijphart establishes empirically that electoral systems favoring consensus-oriented governance yield gains in citizen satisfaction. When the rules of the electoral process encourage multipartism and coalition building, the policy preferences of the median voter have a

greater chance to be represented in the government of the day. Lijphart's data show that the distance between governments and median voters is highest in majoritarian systems (with the United Kingdom representing the high end of the scale) and lowest in more proportional systems (with Ireland and its single transferable vote system producing the narrowest gap). Because in PR systems electoral "losers" often have a chance to join postelection coalitions—and due to the frequent proportional representation of opposition parties on legislative committees—Lijphart is able to find a statistically significant difference between citizen satisfaction in countries with alternative electoral systems. Lijphart's study corroborates earlier work by Klingemann (1999), who found that Danes and Norwegians—each with highly proportional systems—scored the highest levels of democratic satisfaction.

Given the volume of empirical applications of existing political science theoretical work on elections, it is not surprising that there is a foundation of cases demonstrating how changes in electoral rules actually impact voter behavior and system characteristics. Indeed, the lessons of major 20th-century electoral reforms in three countries—France, Japan, and New Zealand—are instructive. The French case illustrates how constitutional architects can try to contain what are perceived to be the excesses of proportional representation. Those designing the 1958 Fifth Republic sought to use electoral rules to avoid reproducing the fleeting and weak multiparty coalition governments that had plagued the Fourth Republic from 1946 to 1958 and brought the system to the brink of collapse. The new two-round, single-member district system established in 1958 encouraged broad political party competition in a first round and awarded National Assembly seats to all candidates winning an outright majority. Absent a majority, all candidates receiving at least 12.5% of first-round votes could then contest in the runoff election, in which a plurality would suffice for victory. In practice, this runoff mechanism encourages the weakest candidates to voluntarily stand down in favor of a better positioned candidate closest to them on the left-right ideological spectrum and to have their supporters cast their second-round ballots for that person. This system has effectively preserved France's multiparty system while simultaneously creating a stable two-bloc system of parties on the moderate left and right. The runoff system often means that parties with meaningful support nationwide may still fail to secure national legislative seats, as has been the case with the far-right National Front party. Indeed, when the French tinkered with their electoral laws in the 1980s, it became apparent how decisive the rules can be for representation. In 1986, the Socialist government of President François Mitterrand opted to change from the two-round system to a single-round proportional one in hopes of dividing the right wing opposition parties. As a result, the National Front's 9.6% of the vote earned it 35 of the 577 national legislative seats. When party strategy changed and France reverted to

the two-round system for the 1988 parliamentary election, the National Front's 9.7% of the first-round vote translated into only one seat!

In Japan, major reforms occurred in 1994, when the old system of single nontransferable votes (allowing one choice per voter in elections for three to five district representatives) was scrapped and replaced by a mixed-member system. The new Japanese system for electing the House of Representatives combines first-past-the-post single-member districts (for 300 seats) with PR party-list seats (200) in an "attempt to craft a competitive two-party, issue-oriented politics and a cleaner, more efficient government" (Norris, 2004, p. 5). Whereas Japanese politics prior to the reform consisted mainly of one dominant party (Liberal Democrats) regularly overwhelming a handful of opposition, the new hybrid of majoritarian and proportional approaches (most analogous to the system in Russia) aims to create a polity with alternating parties in power. In New Zealand, at roughly the same time, reforms to replace the long-standing first-past-the-post system came to fruition. There, a mixed-member proportional system now allows 70 of the 120 national parliamentary seats to be elected directly in single-member districts, with the remainder coming from party lists in a style similar to Germany's. The addition of proportionality to New Zealand's electoral system—endorsed by a majority of citizens in a binding 1993 referendum—has had a quick and dramatic impact. Whereas the average number of political parties gaining seats in New Zealand's national parliament was just two during the 1946-to-1993 period, in the five elections since introducing the mixed-member system, an average of seven parties has secured representation. Electoral engineering, at least in this case, seems to have achieved the end envisioned for it.

Perhaps nowhere is political science research into comparative electoral systems more salient than in countries attempting to transition away from authoritarianism. The cross-national lessons available to architects of new systems are always imperfect, as transporting a model from one country to another without sensitivity to local conditions and histories is a formula for failure. However, such comparative learning does take place, and most new electoral systems today are adaptations and amalgams of those found elsewhere. When elections were held in December 2005 to constitute a post-Saddam Iraqi Council of Representatives, a proportional party-list system determined 230 of the total 275 seats in 18 multimember districts (*governorates*). An additional 45 compensatory seats were then allocated to political entities that did not win any seats outright in the governorates but that did clear a minimum national threshold. Also worthy of note is that Iraq's electoral law requires at least 25% of the members of the parliament to be women. In Afghanistan, post-Taliban elections have struggled to secure domestic and international legitimacy. The 2005 elections for Afghanistan's lower house of parliament employed the single nontransferable

vote method in 34 multimember constituencies. Candidates, however, ran independently because parties and lists were not recognized by the governing law. As in Iraq, the Afghan system reserved a number of seats (at least 68 of the total 249) for women. At the executive level, the Afghan president is elected by absolute majority in a two-round system similar to that employed in France.

Policy Implications

The choice of election system can potentially impact the quality and kind of policy pursued by an incumbent government. If elections are the essential ingredient in representative democracy, then presumably there should be some apparent connection between the will of the people as expressed through elections and the policies they receive from the subsequently invested government. If citizens are engaging in issue *voting*, as some research has consistently found, then it is important to gauge whether the governments they get are actually responsive to those issues. If our fundamental expectations about democracy require a close connection between elections and policy outcomes, then the reality may sometimes disappoint (Ginsberg & Stone, 1996). As Downs (1957) contended, political parties adopt policies in order to win elections rather than win elections in order to adopt policies. The achievement of public policy goals may actually be instrumental to the more power-seeking ambitions of parties and politicians.

Political scientists therefore examine the ways in which different electoral systems hold officials accountable for their fidelity to campaign promises once in office. Indeed, elections provide a kind of *ex post* accountability for policy pledges. The more a particular model of election creates the perception among elected officials that those they claim to represent will oust them for poor past performance, the stronger the democratic accountability linkage is said to be. Although several scholars (e.g., Lijphart, 1999; Powell, 2000) demonstrate that citizen satisfaction and the correspondence between median voters and the policy positions represented in a legislature are enhanced by consensual, proportional representation, there is also reason to find that majoritarian systems provide the kind of clarity that voters need to hold leaders accountable for policy choices. In a majoritarian, winner-take-all system, if a party campaigns on the basis of very clear policy pledges, wins the election, and then proceeds to depart dramatically from its public promises (what political scientists call engaging in *moral hazard*), the voters should be able to easily identify this lack of fidelity and then “throw the rascals out” at the next electoral opportunity. By contrast, in electoral systems characterized by proportional representation, the likelihood of multiparty coalition governments forming after protracted negotiations is great. In such cases, the

translation of electoral verdicts into governmental policy becomes significantly more indirect. Moreover, the distribution of policy portfolios across multiple parties blurs the lines of accountability and increases the difficulties for voters who wish to reward or punish the incumbents. For example, the citizen asked to evaluate with one vote the performance of a three-party coalition government may find it hard to express support for that government’s fiscal policy (headed by a Conservative Party finance minister) while rejecting its policies on education (headed by a Christian Democratic Party education minister), as well as those on immigration (headed by a Nationalist Party interior minister).

If elections are central to the functioning of democratic political systems, then another set of policy implications can be found in the promotion of democratization through elections and electoral reform. The foreign policies of many established democracies, as well as those of intergovernmental organizations and donor agencies, are intimately tied to this kind of promotion. The conduct of free and fair elections is frequently the litmus test for legitimacy in the eyes of the democratic international community, and everything from diplomatic recognition to commercial relations can hinge on the successful holding of competitive elections. As such, governmental entities such as the United Nations or the European Union will regularly send election monitoring missions to observe voter registration and the casting of ballots to gauge openness, extent of fraud, and incidents of intimidation. Nongovernmental organizations, such as the Carter Center, have also played this monitoring role in Africa, Latin America, and Asia. International financial institutions, such as the World Bank, also incorporate elections into decisions about granting development assistance funds to countries in need. This process of *political conditionality* is the stipulation of the conduct of democratic elections as a necessary occurrence prior to the allocation of foreign aid. Such conditionality has been part of the Structural Adjustment Programs implemented by the World Bank and the International Monetary Fund in exchange for lower interest loans to developing countries. Critics of these policies contend that tethering development assistance to political reforms is tantamount to threats that will lead to the rapid importation of electoral mechanisms that ultimately fail to take root.

Future Directions

As democracy expands (and sometimes contracts) across the globe, research on elections likewise adapts. Political scientists continue to focus on formal rules and designs; on individual-level attitudinal and behavioral responses to those formal mechanisms; and on the connections among elections, party systems, and policy outcomes. One of the particular growth areas for future research in the area will be that addressing referenda and other forms of direct

democracy. Referenda can take many different forms, with some being ad hoc and others constituting routine and regular procedures. They are advocated on the logic that circumventing the normal representative institutions in favor of direct votes by the entire electorate will encourage more citizens to become better informed and more involved in the democratic decision-making process. Singling out a policy choice for a decision by the people should, moreover, grant clarity to the direction desired by citizens; in contrast, the normal process of bundling multiple policy choices within legislative bills makes it hard to achieve such clarity. Finally, it is presumed that decisions arrived at through referendum elections will enjoy much greater legitimacy than those achieved through competition or cooperation of the political elite. With greater legitimacy, we should expect, in turn, the greater likelihood that those policies are successfully implemented. Referenda, plebiscites, and citizens' initiatives take place in many countries: Switzerland uses the people's initiative with relative frequency (more than 400 national referenda since 1945); French and Dutch voters were asked in their respective 2005 national referenda whether they supported a proposed European Union Constitution; and voters in East Timor chose to part from Indonesia in a 1999 referendum. Although the United States does not hold national referenda, some states and many localities do hold frequent initiatives and ballot propositions (for example, California's 1978 Proposition 13 on property taxes and its 2008 Proposition 8 on same-sex marriage).

Future research should build on the increasing relevance of referenda and initiatives to explore the impact of question wording and ballot structure on voting outcomes. Assumptions about referenda being decided by informed and engaged citizens need to be tested thoroughly, across time and across countries. If empirical support does not emerge to substantiate that there are informational gains associated with referenda to a greater extent than in regular elections, then some normative red flags need to be raised regarding the utility of this form of democratic decision making. Fodder for further research comes with the varying turnout requirements that countries impose for the verdicts of direct democracy votes to be implemented: Why do different countries place the turnout threshold at different levels, and do high thresholds unfairly violate majorities that fail to reach them? Do voters behave differently when referendum elections are merely advisory rather than binding on the government? Most important, is there any empirical reason to expect that direct democracy elections are supplanting conventional political elections in any meaningful way? These trends and prospects clearly deserve the attention of 21st-century political scientists.

Conclusion

The rules governing and guiding voting are central to the study of contemporary politics. Decades of comparing

electoral systems have produced important findings about the impact of alternative majoritarian and proportional systems and the many hybrid models in between. Duverger's early assertions about the influence of ballot and district type on the size and character of political party systems have risen to the status of "law" in the discipline and spawned subsequent and more sophisticated theorizing. A considerable body of evidence now exists to help explain how the choice of electoral system can influence the quality of a country's democracy. Introducing or reforming electoral rules can alter citizen participation and satisfaction, can enhance or diminish the congruence between voter preferences and public policy outputs, and can have profound consequences for system stability. Electoral engineering as such is one of the clearest issue areas in which political science research speaks directly to decision makers. Indeed, given that for centuries revolutions have been fought and blood spilt for the right to live in a democracy, it is imperative to understand how elections can support or undermine transitions from authoritarian rule. Some of the most tenuous polities around the globe struggle with legitimacy and leadership transitions, and designing an appropriate electoral system shapes—if not determines—those countries' futures. Theories and data assembled for study of the United States, western Europe, and other cases of consolidated democracy offer much to the electoral engineer, policymaker, and student observer; they cannot, however, be casually transported across the globe to nascent democracies without due consideration of the opportunities and constraints defined by a country's individual context.

COMPARATIVE FEDERALISM, CONFEDERALISM, UNITARY SYSTEMS

WILLIAM M. DOWNS

Georgia State University

One of the classic challenges of political organization is the territorial or spatial division of power. Just as constitutional engineers, politicians, and philosophers have struggled over the concentration or separation of horizontal (e.g., executive, legislative, and judicial) powers, so too have battles been fought over the distribution of vertical (e.g., central, regional, and local) authority. Although the late 20th and early 21st centuries have featured significant movement in favor of boundary broadening and the interdependence of outward-looking states, the salience of interactions among countries' internal units remains high. Indeed, understanding the contemporary nation-state demands that political scientists make sense of the centrifugal pressures of decentralization that coexist alongside centralizing trends of integration and unification. Scholars have generally classified approaches to the geographic dispersion of governmental authority by grouping states into unitary, federal, and confederal types. Research on the different system types has evolved from early work on nation building and pacification of regional tensions to contemporary efforts to explain differences in the quality of representation, in the durability of alternative models, and in the adaptability of structural designs to the changing demands of global interdependence.

Unitary systems are those in which sovereignty, decision-making authority, and revenue-raising powers are

clearly and solely vested in a single central government. Subnational units may exist in unitary states, but they enjoy only those powers specifically delegated or "devolved" to them by the central government, and those powers can be revoked at the center's discretion. The majority of the world's states today exemplify characteristics matching this definition of the unitary system. Among those are France (the "one and indivisible" state long held up as a quintessential example of the unitary model), Japan, and China. The United Kingdom is frequently cited as a striking example of a unitary state that has devolved limited powers to a series of regional assemblies (Scotland, Wales, Northern Ireland) without transforming into a federation. Among the putative advantages of the unitary state system are clarity in the lines of accountability, coordinated control by a primary legislature and executive, and the ability to ensure equality in treatment of all parts of the country through uniform application of common laws. Chief among the supposed limitations of the unitary state design are difficulties in accommodating local differences and the potential for excessive concentration of power in the capital.

Federal systems are said to combine self-rule with shared rule, characterized by a strong central government coexisting with subnational units that enjoy their own spheres of jurisdiction and resource bases. Sovereignty is shared across levels of government, and the formal distribution of powers

is defined constitutionally (rather than at the center's discretion). Powers can be taken from subnational units only by amending the national constitution. While no single, pure model of the federation exists, several characteristics are normally central to classifying states in this category. Among these characteristics are the existence of a bicameral legislature (with an upper house designed to represent interests of the constituent subnational units), the presence of a court to adjudicate disagreements between the federal and subnational authorities, and elected executives at the federal and regional levels. The federal (i.e., central) government retains almost exclusive authority to act on behalf of the nation-state in its dealings with foreign entities. Although federations constitute a distinct minority within the universe of contemporary states, they tend to emerge in large or populous countries (e.g., the United States, Canada, Germany, India, Brazil, Australia, Austria) and therefore constitute important influences on a substantial portion (approximately 40%) of the world's citizens. Frequently praised for balancing competing loyalties and facilitating good governance in heterogeneous societies, the federal model is likewise also charged with being excessively redundant and slow due to multiple decision makers ("veto players") and overlapping jurisdictions. Federations are also critiqued for allowing regional and provincial identities to persist as challenges to national unity and for enabling subnational units to pass laws different from those of the federal government.

Confederal systems likewise feature a central government coexisting alongside subnational units, but in this model, the provincial, regional, or state governments are significantly stronger than the national authority. Indeed, the central government relies heavily on the association of subcentral units for resources and the authority to act. Whereas membership of constituent territorial units in a federation is mandatory, in a confederal arrangement the subcentral entities participate voluntarily and can much more easily exit the partnership. Typically, major country-wide decisions rely on the unanimous consent of the regional units. The confederation effectively exists as a community or alliance of individual political entities in which primary emphasis is placed on protecting the liberties and identities of the constituent units. In practice, the central government has a limited policy purpose (primarily defense and foreign policy). The rarest of the state forms, confederation is most frequently associated with the United States under the Articles of Confederation (1781–1789), the Confederate States of America (1861–1865), Switzerland (1291–1847), the Commonwealth of Independent States (former USSR), and the emerging European Union (EU). While generally successful in dealing with a range of common but limited governmental problems, confederations can struggle when weak central authorities cannot enforce national laws, generate sufficient independent revenues, or adjudicate intergovernmental disputes.

Theory

An impressive body of political science literature has evolved regarding the different forms that geographic distribution of power can take. The contemporary literature rests on a foundation of centuries' worth of writings by political philosophers and constitutional architects who focused squarely on both the normative and practical questions of how to build a desired polity. Among those who emerged along this lengthy early chronology to deliberate the proper balance of centralization and decentralization were Althusius, Grotius, Montesquieu, Mill, Hobbes, and Madison. Althusius's *Politica*, written in 1603, is, for example, considered by many to have been the earliest coherent formulation of bicameralism as a method of consensual decision making by communities within a union. Hobbes has often been held up as a defender of the model of centralism (manifested most clearly by the United Kingdom's Westminster system), and Madison is one of the most frequently cited defenders of decentralization as a mechanism for the prevention of tyranny (exemplified by the American federal experience). Their ideas provided inspiration for founders and reformers in multiple country contexts. Whether by imposed force, organic evolution, or explicit choice, models of territorial politics developed with varying degrees of effectiveness and durability. Much of the subsequent theoretical and empirical work on centralism and decentralism by political scientists has focused on the American case, but recent decades have witnessed good comparative work by scholars seeking to identify generalizable patterns from the systematic testing of theory-driven hypotheses. The evolution of theories on unitary, federal, and confederal systems mirrors general trends in the discipline, with formal legalism being supplanted by behavioralist and choice-based approaches.

The early baseline for much of the modern political science work in this area is provided by Riker (1964), Friedrich (1968), and Duchacek (1970). Riker's pioneering book, *Federalism: Origin, Operation, Significance*, was one of the first efforts to move the study of territorial design away from single-country monographs about formal administrative design to a more hypothesis-oriented study of the incentives that motivate politicians to choose one model over another. His theoretical concern was to proffer explanations for two phenomena: (1) adoption of a particular design and (2) maintenance and survival of chosen government forms. In particular, Riker asked, Why adopt a federal model? and Why keep it? Calling a comparative study of federalism "far too pretentious a project for one man" (p. xii), Riker focused his study on the United States while explicitly generating hypotheses that could be tested elsewhere. Conscious of his role as a neutral social scientist, Riker also deviated from conventional practice and decided to minimize normative questions of morality and efficiency in favor of theory-building empiricism. The

crux of his theoretical contribution lies in identification of two factors—the *expansion condition* and the *military condition*—that are necessary to any understanding of comparative federalism. According to Riker, the adoption of a federal model over a unitary form can be explained in part by politicians' concluding that giving concessions to the rulers of constituent units is the only way to secure a desired expansion of power without the use of force. This logic of consenting to shared rule in order to secure expansion constitutes one of Riker's necessary conditions for the *federal bargain*. The second necessary condition is the presence of "some external military-diplomatic threat or opportunity" (p. 12) that would lead politicians to give up some independence in favor of a federal union. Beyond theorizing the factors that lead to adoption, Riker argued that the structure of a country's political party system is what "encourages or discourages the maintenance of the federal bargain" (p. 51). In doing so, he rejected traditional formal-legal explanations based on the particular division of administrative responsibilities. Indeed, for Riker, the theoretical linchpin for understanding the survival of federal forms is the existence of decentralized party systems that can protect the integrity of subnational units in the federal system and thereby help preserve the federal bargain. Riker also placed emphasis on simultaneous citizen loyalty to both federal and regional levels of government, but he contended that loyalty to "dissident provincial patriotisms" is not essential. Having ventured this framework for understanding federalism, Riker nevertheless concluded that notions of federalism as a guarantor of freedom are false.

Friedrich's 1968 book, *Trends of Federalism in Theory and Practice*, marked an additional step in the early development of political science approaches. Even more explicitly than Riker, Friedrich argued that federalism must be seen as a dynamic process embedded in historical tensions rather than as a static institutional design governed by unalterable rules. According to this logic, federalist beliefs and behavior are every bit as important as formal constitutional design and juristic preoccupations with questions of sovereignty, the distribution of competences, and institutional structures—if not more so. Friedrich posited and confirmed the hypothesis that federalism does not work when it is imposed, and he placed the greatest analytical emphasis on an underlying "federal spirit" necessary to maintain the system. The particular form that decentralism through federalism takes—as well as its likelihood of success—"depends on the degree of differentiation in the community, the urgency of the common task, the strength of the interests and beliefs in their particular mix of time and place" (p. 174). Although stopping far short of seeing federalism as a panacea, Friedrich deems it "a useful instrumentality for good government" (p. 184).

Duchacek's *Comparative Federalism: The Territorial Dimension of Politics* (1970) raised further theoretical challenges, mapping out a systematic case against classifying political systems in "rigid unitary, federal, or

confederal categories" (p. ix). Indeed, Duchacek doubted the analytical utility of distinguishing between federal and unitary states and worried that *federalism* could now be described in the following terms:

one of those good echo words that evoke a positive response but that may mean all things to all men, like democracy, socialism, progress, constitution, justice, or peace. We see the term applied to almost any successful combination of unity with diversity, to almost any form of pluralism and cooperation within and among nations. (p. 191)

Admitting that no accepted theory of federalism exists, Duchacek questioned the merits of using the United States as a baseline for all comparisons (but then offered no superior alternative) and disagreed with Riker on viewing federalism as a mutually agreed on bargain:

Rejection of a unitary system and the adoption of some variant of a federal formula is rarely a matter of free choice on the part of a handful of constitutional lawyers gathered in an ivory tower seminar on comparative constitutional law. There is often simply no practical alternative to the adoption of federalism. (p. 206)

Most important, Duchacek's (1970) lasting theoretical legacy lies in creating the "ten yardsticks of federalism" (pp. 112–155) that presume to capture the reality and indestructibility of federal unions. These include measures of central control over national defense and international diplomacy, immunity against dissolution by secession, ability of the central government to exercise its authority independent of approval and resources of constituent units, control over amendments to the constitution, protections for the identities of component units, equal representation of unequal units in a bicameral legislature, independent sets of courts at federal and subnational levels, an independent court to adjudicate disagreements between central and subcentral units, retention by lower levels of those powers not expressly granted by the constitution to the central authority, and clarity in the territorial division of authority.

Together, the early works on federal alternatives to unitary states spawned subsequent research that is increasingly sophisticated in theoretical approach and more broadly comparative in data collection. Of that literature it can be said first, however, that conceptual debate still dominates. Although political scientists remain clear on what constitutes a centralized unitary state, decentralizing trends in formally unitary states have "shifted scores of formally unitary countries into the gray zone between federalism and unitarism" (Eaton, 2008, p. 666). Federalism itself is subject to distinction and disaggregation, as illustrated by King (1982), who refers to *federalism* as ideology or philosophy and to *federation* as institutional fact, clearly suggesting that it is possible to have federalism without federation. Forsyth (1981) views confederation as

a union of states within a single polity, to be distinguished from a federation as a union of individuals within a single polity (the latter representing greater national unity). Beyond conceptual wrangling, however, there are continuing disputes over the relative virtues of different forms of decentralization. Gerring, Thacker, and Moreno (2005) construct a theory of *centripetalism* distinct from centralism that counters a growing scholarly consensus emerging around the merits of decentralization. The diffusion of power among multiple independent decision makers, with power flowing outward in a centrifugal fashion toward the periphery, is “the reigning paradigm of good governance in academic and policymaking circles at the turn of the twenty-first century” (p. 569). The decentralist model, they claim, may, however, actually undermine the quality of governance in a polity by introducing excessive fragmentation, mixed messages, and chaos. A centripetal design, by contrast, can strengthen national political parties, institutionalize corporatist-style interest representation, encourage collegial decision making, and provide authoritative public administration. Such an approach stands in contrast to those who, like Lijphart (1999), see the centripetalism of unitary states as part of a majoritarian model that is excessively exclusive, competitive, centralized, and adversarial.

Applications and Empirical Evidence

Much empirical work has been assembled in attempts to explain why unitary, confederal, and federal forms emerge, endure, and sometimes collapse. As argued by Tarr (Kincaid & Tarr, 2005), those questions and answers find specific form in a range of empirical markers that political scientists can and should compare: adherence by governments and politicians to the regime’s constitutional provisions, the political and social (in)stability produced by the choice of territorial governance model, popular support and satisfaction, democratic performance, provision and guarantees for individual and/or communal rights, and economic performance.

Contemporary cases demonstrate that the durability of unitary forms—still the most frequent arrangement for territorial governance—requires adaptation. Indeed, many countries long considered exemplars of centralized governmental structure have in recent decades engaged in decentralization reforms while stopping well short of committing to a federal bargain. Adaptation through decentralization has been a function of multiple influences. Economic contraction beginning in the 1970s, for one, spawned a number of reforms by central governments aimed at “offloading” burdens to regional and provincial units. Elsewhere decentralization became an instrumental part of oppositional politics—out parties struggling to win office found that pledges to dismantle unitary states could produce gains at the ballot box, and once in office, some of those newly

incumbent parties delivered on campaign promises. Decentralization has also been seen more broadly as a natural progression in the democratization of states that no longer required the tight control necessary at their founding. Other cases reveal decentralization to be driven by the desire to pacify persistent—and sometimes volatile—regional nationalisms. Further, the opportunities afforded by new forms of supranational governance (the EU, for example) have emboldened and empowered subnational entities that see the sovereignty of the traditional nation-state as compromised and increasingly obsolete.

The range of motivations driving the “devolution revolution” (Hueglin & Fenna, 2006) is illustrated clearly by three European cases: the United Kingdom, France, and Italy. In the United Kingdom, the catalyst for devolution was an out party that had lost four consecutive general elections but which seized strategically on decentralization as a popular campaign pledge in 1997 and then followed through on its promises once in power. For centuries, the struggle in what became the United Kingdom of Great Britain and Northern Ireland was to pacify rival national identities in Scotland, Wales, and Ireland and to link them tightly under one crown and one authoritative government in London. Administrative unity, however, never wholly eliminated regional identities and interests. Discovery of North Sea oil in the 1970s—with its potential for revenues—fueled a resurgent Scottish nationalism. Frustration over a disappearing language and cultural distinctiveness powered (albeit to a lesser extent than in Scotland) Welsh demands for autonomy. In Northern Ireland, outright and protracted conflict between Protestant unionists and Catholic republicans spawned *the Troubles* and defied easy resolution. Structural reform through devolution came to each of these constituent units of the United Kingdom when Britain’s Labour Party—struggling in opposition for 18 years—promised in a successful 1997 election campaign to grant powers to directly elected assemblies in Edinburgh, Cardiff, and Belfast. With devolution as a centerpiece of Prime Minister Tony Blair’s new government, Northern Ireland’s elected Assembly convened in 1998 (only to be suspended by London on multiple occasions from 2002 to 2007), and new Scottish and Welsh parliaments were elected in 1999. With devolution initiated, there has been no subsequent evidence of the United Kingdom’s moving toward federation despite the laments of its critics. Indeed, support for preserving the sovereignty of this multination-state has to date overshadowed any emergence of the federal spirit on which Friedrich’s early work placed so much emphasis.

Devolution in the unitary French state illustrates the (especially) left wing ideological belief in democratization through decentralization. French Socialists, led by President François Mitterrand, used their landslide 1981 election to dismantle Parisian centralism and create 26 directly elected regional councils (each with an indirectly

elected president). The decentralization laws of 1982 and 1983 were designed by the Socialist-led left (and over the objections of the Gaullist right) to “lift the rigid Napoleonic iron corset from the statist French bureaucratic government administration” (Tiersky, 2002, p. 148). Adding a genuine bottom-up dimension demonstrates the “realization that even the most famously unitary state of Europe would benefit from some form of shared or divided governance” (Hueglin & Fenna, 2006, p. 23). In Italy, social pressures from below were certainly present in the 1970 reforms that created new administrative regions and devolved powers to them; however, the desire by central authorities to contain expenditures and respond to fiscal pressures was more determinative. Offloading and controlled burden sharing in the Italian system have resulted in marked variations in institutional success throughout the country (e.g., greater success in the north, less in the south). Research into the role of *social capital* and civic traditions in explaining the variable success of Italy’s devolution forms the basis of Putnam’s *Making Democracy Work* (1994), one of the most celebrated political science books in recent decades.

Although some states have demonstrated flexibility and adaptation while retaining their essential character as unitary polities, others have transformed into either full-fledged or nascent federations. Belgium, for example, is illustrative of Duchacek’s (1970) contention that sometimes there is simply no practical alternative to the adoption of federalism. A classic unitary state in the Napoleonic conception since its creation in 1830, Belgium grew into an awkward amalgam of linguistic communities that simmered to a crisis in the late 1960s. A French-speaking south (Wallonia), a Dutch-speaking north (Flanders), and a predominantly francophone capital, Brussels, embedded within the Flemish north meant that cultural and economic disagreements could not be easily resolved through partition or separation. Constitutional reforms in 1970 and 1980 laid the groundwork for the 1993 addition of a new Article 1 of the Belgian Constitution, formally proclaiming Belgium to be a federal country with elected parliaments in Flanders, Wallonia, and Brussels, as well as a reformed national parliament. Deschouwer (2005) described Belgium’s metamorphosis from a unitary state to a federal one as follows:

the result not of a deliberate choice but of incremental conflict management. . . . Federalism just happens to be the system of government that emerged, to some extent as the unwanted consequence of the search for a way to keep two increasingly divergent parts of the country together. (p. 51)

Another “new, although reluctant, member of the family of federal polities” (Steytler, 2005, p. 312) is South Africa. The negotiated compromise reminiscent of Riker’s federal bargain that reshaped the South African state is found in the arrangements for cooperative government through decentralization in the 1996 postapartheid constitution.

Architects of South Africa’s new nonracial democracy sought to simultaneously build a sufficiently strong central government to transform a system tormented by decades of White minority rule while limiting the potential abuses of majority rule through decentralization to new provincial authorities. Granted few exclusive powers, South Africa’s nine provinces enjoy concurrent powers in such important areas as agriculture, environment, culture, health services, housing, transportation, and education. As in established federations such as Canada and India, any remaining residual powers rest with the national government. Replete with federal elements without formally declaring itself a federation, South Africa demonstrates a relatively strong commitment to cooperative decision making among communities. Such is rare in sub-Saharan Africa, with the potential exception of Nigeria.

Empirical applications of confederal principles are more difficult to locate in the 21st century. However, if most political scientists agree on a major political system meeting the standards of strong local units allied in cooperation with a weaker central authority, then that system is the contemporary EU. Majone (2006) deems the EU to be “a failed federation but a successful postmodern confederation” (p. 122). Its 27 independent member states are by treaties linked through common institutions and rules—thereby relinquishing portions of their sovereignty—in order to secure the common goals of economic integration and democratic peace. The member states retain most of their long-standing jurisdiction over domestic and foreign policy, and they are the central actors in generating revenue for the Union. The Council of Ministers, bringing together representatives of the member states’ incumbent governments to determine policies for the EU, is an explicitly intergovernmental institution. Moreover, major changes to the EU (including the addition of new members) cannot take place without the unanimous agreement of all member states. One particularly poignant reminder that the EU is not a fully integrated federal polity is that both Britain and France—not Brussels—retain complete control over their nuclear arsenals. Likewise, neither Britain nor France has relinquished its permanent seat on the United Nations Security Council in favor of the EU. In terms of Duchacek’s other yardstick items for measuring federation, the EU also falls short for failing to have the ability to exercise its authority independent of approval and resources of constituent units, for the absence of an elected bicameral legislature, and for being unable to codify its governing framework in a genuine constitution. In some very real ways, then, the EU appears as a compact between independent units rather than as a fully formed federation.

To be sure, some observers contend that the EU has developed well beyond its confederal origins. For Verney (2002), “The European Union is more than a confederacy. It enjoys some of the powers that normally pertain

only to states” (p. 18). The European Commission is a supranational institution that well exceeds the intergovernmentalism of the Council, and there is a court to adjudicate disputes among the constituent units, as well as between the member states and the union. The European Parliament is the world’s only directly elected multinational legislature, with codecision powers on the rise. Issues of trade and commerce are increasingly the preserve of EU institutions rather than individual nation-states. This conscious coming together of 27 long-established, independent states willing to submit to a higher authority on a wide range of meaningful issues warrants, in this view, the label of federation.

Uncertainty over how to classify the EU and skepticism about its future prompt a further, and especially important, observation, namely, that forms of territorial governance are dynamic and not inevitably successful. Indeed, an additional area of political science research focuses on the failure of federal experiments. Kavalski and Zolkos (2008) hypothesize that federalism will fail if it does not conform to the rules of liberal democracy, if it does not provide an effective institutional setting for the accommodation of identity, and if it is imposed either externally or domestically (by a particular group). Support for the proposition that federalism and authoritarian tendencies are incompatible can be found in the former Yugoslavia, Czechoslovakia, and the Soviet Union. In Yugoslavia from 1943 until 1991 the country functioned on the basis of federal arrangements that linked six republics—Slovenia, Croatia, Bosnia and Herzegovina, Serbia, Montenegro, and Macedonia—whose citizens had a painful and protracted history of interethnic conflict. If Yugoslav federalism aspired to balancing self-rule with shared rule to pacify that conflict and forge a Marxist-socialist consciousness, then in practice it nevertheless rejected political pluralism, monopolized power in the hands of Communists, and strictly limited the rights of individual citizens. The demise and breakup of federal Yugoslavia unleashed civil war and ethnic cleansing. Similarly, in Czechoslovakia from 1918 until its breakup in 1992, liberal democratic values and rights were constrained by Communist rule. When openness came—and came swiftly in the late 1980s—the institutions of Czechoslovakia’s federal state proved incapable of avoiding guilt by association with an illiberal regime and therefore failed to survive the transition and consolidation into post-Communism. Federalism likewise could not hold together the disparate peoples of the Soviet Union. Instead, federalist structures from 1917 through 1991 were instruments of an ideology that sought to control and suppress individual rights and identities rather than to protect them in peaceful coexistence.

Federal systems that fail to accommodate group identities through stable institutional arrangements are also likely to arrive at a premature demise. Examples abound, including those in Ethiopia–Eritrea, Indonesia, and Cameroon. In postcolonial Ethiopia from 1952 to 1962,

United Nations–mandated efforts to incorporate Eritrea employed federalism as a means of strengthening state elites rather than as a mechanism for ethnic accommodation. Elaborate protections of Eritrean identity and autonomy formalized in a constitution were, however, systematically ignored by the Ethiopian government. Policies of assimilation repressed rather than respected Eritrean history and culture, as did the suppression of symbols such as Eritrea’s flag and restrictions on languages. The federation dissolved in 1962, was replaced by annexation, and witnessed 30 years of civil war that culminated in Eritrea’s independence in 1993. A federal system established in postcolonial Cameroon in 1961 failed to achieve institutional balance for that artificial country’s anglophone and francophone communities; instead, the asymmetrical nature of that federal design clearly favored the francophone elites, who orchestrated the federation’s demise in 1972. Cameroon’s defunct federalism made way for a new unitary state structure, rather than outright separation. Other examples of fleeting federations that failed to succeed include Indonesia, which lasted a mere 9 months in 1950. There the advocates of federalism chose a system that sought to impose a national identity from above instead of skillfully protecting and balancing competing identity claims from below.

Empirical evidence also suggests that the success of federalism is less likely when federalism is imposed rather than chosen. British imposition of a federal framework for the West Indies from 1958 to 1962 met with failure and collapse. Similarly, efforts from 1947 to 1971 to establish a federation connecting Pakistan and what was then known as East Pakistan were neither negotiated nor homegrown; as a result, the absence of popular or elite support led to schism, breakup, and the creation of a separate state (Bangladesh). The aforementioned examples of failed federations in Ethiopia–Eritrea as well as the Soviet satellite states provide further support for an inverse relationship between imposition of federalism and its successful implementation.

Policy Implications

If history is littered with examples of territorial governance structures that failed, then it offers a cautionary tale to those reforming old systems or seeking to create new ones in the aftermath of civil conflict or interstate wars. For this reason, political science research on unitary, federal, and confederal arrangements is particularly salient to policymakers seeking solutions to ethnic or territorial discord in places such as Iraq, Afghanistan, and Serbia. There they must ask and answer questions about the institutional forms and procedural safeguards that will give the system the greatest chance to achieve policy objectives (e.g., stability, legitimacy, protection of minorities, production of public goods, and economic efficiencies). Bermeo (2002)

argues that “no violent separatist movement has ever succeeded in a federal democracy” (p. 108). If that is the case, then policymakers in divided societies will have to balance the presumed peaceful by-products of federalism against the traps into which previous but now-defunct federations have fallen.

One of the most contentious policy areas is language. In unitary states, the central government will typically have exclusive jurisdiction over official language rights. That kind of exclusive control frequently coincides with conscious policies of assimilation. By contrast, federal states will normally grant shared or overlapping powers to central as well as regional governments. If federalist principles are pursued, then the ideal policy outcome would be some effective balance between unity and diversity such that citizens using majority and minority languages are equally protected. In Canada, for example, francophone minorities outside Quebec and anglophone minorities inside Quebec enjoy equivalent constitutional protections. The Belgian federation grants exclusive powers to community institutions to regulate language (as well as culture and education). In Spain, which embodies certain elements of federalism without formally constituting a federation, language laws protect Catalonia’s unique language and even make prohibitions against excessive use of the nationally dominant Castilian. India’s federal system provides official status for many of its minority languages, such as Punjabi and Marathi. In transitioning and contested states such as Iraq, policy uncertainty over minority languages could potentially thwart consolidation of a new polity. Recognized alongside Arabic under a 2005 Iraqi constitution, the Kurdish language presently enjoys formal protection and guarantees that elude Kurds in neighboring Iran, Turkey, and Syria.

There are also related policy implications in the area of education. In unitary France, for example, education is so highly centralized that it has long been said that one could look at the clock at any given time and know exactly what textbook schoolchildren throughout the country were reading at that moment. In Canada, by contrast, the federal government has no central education ministry; instead, each province has its own political and administrative infrastructure with discretionary powers over education. Likewise, in the U.S. federal system, education is the responsibility of local (usually county) and state authorities. Pressures to democratize more tenuous federations have led, in places such as Brazil, to policies of educational decentralization. Elsewhere, as in federal Argentina, education has been decentralized to the local level largely on the basis of cost efficiencies and reductions in central government fiscal deficits. Decentralizing and federalizing education can be highly contentious and, quite often, inefficient, as exemplified by the Belgian experience of dismantling universities (including their impressive library collections) and dividing them into separate francophone and Flemish institutions.

Future Directions

Political science research on unitary, federal, and confederal forms of territorial governance has been preoccupied, first, by the struggle to draw clear distinctions between the three concepts; second, by the desire to explain why different institutional designs have been adopted and adapted; and third, by efforts to isolate the impact of federalism on such key outcomes as ethnic group accommodation and system stability. Real advances in our understanding of state forms have emerged, but definitive findings are few and far between. This leaves much room for future research.

Future research would be well served if it followed Eaton’s (2008) advice: “Federalism is an institutional phenomenon, but it should be examined in ways that are sensitive to the importance of noninstitutional variables” (p. 696). In this way, formal-legal studies must be complemented by those that focus at an individual or group level on interests and identities. How is the federal spirit cultivated—or not—at the grassroots level? How are claims for regional autonomy manipulated by political elites seeking to convince groups to join them in a push for system change? How do citizens in systems of compounded representation weigh the competing claims on their identity from local, regional, national, and even supranational governments? What system types yield the greatest citizen satisfaction and loyalty? Do unitary systems insulate their citizens from the “voting fatigue” that seems to bedevil some federations (resulting, for example, in comparatively low voter turnout in the United States and Switzerland)? Even at the institutional level of analysis, future work will need to expand beyond *de jure* constitutional forms to include studies of how those forms interact with *de facto* executive-legislative relations, rules of electoral contestation, party system development, and the importance of informal networks of decision making.

One especially important direction for future research should be that which examines the impact of unitary, federal, and confederal models on democratic accountability. This fundamental element in the debate over representation and territorial governance is presently underinvestigated. Scholars have proffered compelling arguments to suggest that granting voice to regional interests in constitutionally protected upper legislative chambers helps hold central authorities to account for their policies, that empowering regional governments with important functional responsibilities helps bring government closer to the people, and that having meaningful regional institutions helps prepare (and even screen out) politicians for future national office. However, federalism may also introduce unnecessary ambiguity to the process of assigning credit and blame in a political system through overlapping institutions and shared jurisdictions. It may also reduce voter turnout through a proliferation of elected institutions demanding judgments from voters on a nonstop electoral

calendar. Further, regional governments in federal systems may actually represent a form of unintended centralization if those units usurp functions traditionally reserved for local and communal institutions. It remains unclear, then, whether federalism is superior to unitary forms in this crucial dimension of accountability.

Conclusion

The study of territorial dispersion of power in a system of governance is as old as modern political science, and it clearly dates further back to classical debates about the ideal polity. Contemporary efforts to understand the causes and consequences of different state designs have had to struggle first with establishing distinguishable concepts that accurately capture global variation. Scholars have traditionally had a relatively easy time defining unitary systems and classifying states within that category; however, devolutionary trends and reforms within unitary states have created the odd hybrid of decentralized but still unitary polities that defy simple classification. Although numerous attempts have been made to identify the necessary and sufficient conditions for a country to be labeled a federation, it is simultaneously apparent that no two federations are alike. Indeed, the institutional forms that federations take are a function of alternative conceptions of federalism; thus, U.S. and Canadian federal forms are substantially different, as are those in India, Brazil, Australia, and Germany, because the ideological underpinnings of federalism in each of those cases are products of varying historical experiences. Scholars likewise debate the empirical application of confederal approaches to territorial governance, given that some of the clearest cases of confederalism in practice are historical ones that no longer exist. The EU as an exemplar of confederation is only partially appropriate, and the future evolution of European integration will help clarify whether that community of states retains primary power in the hands of its members or whether, instead, it transfers more to an empowered central government to warrant classification as a federation.

Beyond concerns over conceptual boundaries, political science has focused on identifying the factors that facilitate successful negotiation of a federal bargain as well as the conditions that increase the likelihood that reforms of territorial governance will succeed and endure. Such work has drawn attention to cultural predispositions (presence or absence of a federal spirit), the nature of political party systems, elite motives, external intervention and imposition, mechanisms for the accommodation of group identities, and the inverse relationship between successful federalism and illiberal governance. Additionally, the choice of federal, unitary, or confederal forms can be shown to have practical policy implications in such important areas as language laws and education systems. Debate over these choices and their consequences permeates

political discourse in established democracies, in countries that have transitioned from authoritarian or colonial rule, and in systems emerging from civil conflict or interstate war. As such, the contemporary relevance of research on the political and administrative distribution of power cannot be overstated.

PRESIDENTIALISM VERSUS PARLIAMENTARISM

JOSEPH W. ROBBINS

Shepherd University

Whether a country employs a presidential or parliamentary regime is an incredibly meaningful distinction. Numerous studies have shown that presidential systems result in more open trade policies and greater particularistic spending (i.e., transportation funding, agricultural subsidies, etc.) and are better suited to represent the entire electorate (Cheibub, 2006; Evans, 2004; Keech & Pak, 1995; Shugart & Carey, 1992). In addition, and perhaps more important, researchers have argued that presidential regimes were prone to conflict and, in some cases, democratic collapse (Linz, 1990a, 1994). More recent work has gone even further to help us understand the nuances of regime type. Margit Tavits's (2009) book considers whether directly elected presidents in parliamentary governments produce greater political divisiveness, pervasive apathy among the electorate, and more frequent intergovernmental conflict. Likewise, much has been written on the benefits of parliamentary governments because they are perceived to be fundamentally different from presidential systems. Specifically, parliamentary governments are thought to engender greater public goods spending (e.g., education, health care, and pensions) and be more efficient and more durable than alternative regime types are. Therefore, it is necessary to highlight the differences between these regimes by focusing on how the chief executive and legislature are elected, how these two branches interact with

one another, and how government formation occurs. Once we can clearly distinguish among alternative government types, we can better identify the relevance for understanding topics such as policy making, representation, and democratic survival.

After this chapter describes the key attributes of presidential and parliamentary systems, it discusses the positive attributes of each system. Furthermore, it addresses the recent proliferation of mixed or hybrid regimes—which contain elements of both presidential and parliamentary systems. Political scientists have long debated the potential dangers or “perils of presidentialism” (Linz, 1990a), and a recapitulation of this discussion represents the final section of this chapter. Finally, the chapter briefly delineates the policy impacts of each regime type.

Theory: Identifying the Main Components of Presidential Regimes

When one thinks of presidential systems, the United States and Latin America typically come to mind because they house a vast majority of all presidential regimes currently in operation. But what exactly is included in a presidential state? Fundamentally, presidential regimes are those in which there is a singularly elected politician who

represents an entire country and whose tenure is not predicated on legislative support. There are also states such as Germany, Hungary, and India that have presidents but whose leaders are comparatively minor players in policy making. Accordingly, the mere existence of a president does not necessarily indicate a presidential state; indeed, the German, Hungarian, and Indian regimes are seldom considered true presidential regimes. Clearly, then, there can be substantial variation among presidential regimes since the aforementioned powers are not possessed by all presidents. In fact, presidents may possess any combination of the following tools: appointment powers, cabinet meeting control, veto power, line-item veto power, emergency powers, foreign policy control, authority over government formation, and the power to dissolve the legislature. Aside from this litany of presidential powers, there is another way to discuss or categorize these systems. That said, perhaps it is more useful to focus on four key characteristics of presidential regimes that can be used to differentiate among executive types.

In Matthew Shugart and John Carey's (1992) impressive book, *Presidents and Assemblies*, the authors discuss the relationship between regime type and electoral system and the subsequent implications for how the two concepts interact. Aside from this discussion, Shugart and Carey focus on a number of key characteristics that can help students classify governments as presidential, parliamentary, or mixed. In particular, they argue that there is an inherent trade-off between presidential and parliamentary governments: Presidential governments tend to be more efficient than parliamentary regimes, but the former may not be as representative as the latter. Efficiency, in this case, refers to voters' ability to identify the final government composition in advance. That is, a presidential system is efficient in that voters can identify who will serve as president, or lead the government, prior to the casting of the final vote. In the 2008 presidential election, voters knew that either Senator John McCain or Barack Obama would become the 44th president of the United States. In contrast, parliamentary systems are not as efficient since the final government composition is contingent on the final electoral results and the subsequent political wrangling over the formation of a governing coalition. On the other hand, representation or representativeness refers to how much of the population is represented by the ruling government. Although presidents can theoretically represent the entire populace, this is certainly not a given. The oft-cited example of Salvador Allende's 1970 electoral victory in Chile, with just over 30% of the popular vote, serves as a reminder that presidents seldom represent the entire populace. In parliamentary systems, moreover, representation of the entire electorate is more easily attained through coalitional governments than under a single leader in a presidential system. Thus, parliamentary regimes offer greater representation but are typically less efficient than their presidential counterparts.

Beyond this demarcation, Shugart and Carey (1992) reason that there are other certain essential attributes found in all presidential systems. First, they claim that a separation of powers among branches of government is necessary. For students of American politics, this concept is well-known. A separation of powers refers to a clear division of responsibility, in which most often the executive branch administers the law, the legislature writes the laws, and the judiciary interprets or reviews the constitutionality of the laws. In parliamentary governments, however, such a division of authority is often lacking, as the legislative and executive branches are essentially fused together.

Second, Shugart and Carey (1992) note that presidents are directly elected through some type of nationwide vote. Their ascension into office is not contingent on parliamentary support, but rather they are elected by an entire country. Of course, this too can take place through various mechanisms. Some states use a simple-majority voting system, in which the winner secures most (or a *plurality*) of the popular vote. Meanwhile, countries such as France use a slightly modified format, where the winner must possess more than 50% of the nationwide vote. In those elections in which there is no clear-cut majority winner, the top two vote getters will compete against each other in a second, runoff election. Another approach uses an indirect mechanism, best illustrated by some type of *electoral college*, to elect the president. Although it is not the only country to use this tool, the United States is perhaps the most well-known country to use this complex mechanism. In the case of the United States, both the Republican and the Democratic Party select a slate of electors for each state equal to the number of House of Representatives members and senators from that state. The presidential candidate who wins a plurality of a state's popular vote receives the Electoral College votes of that same state. Each candidate's electoral votes are then summed, and the candidate with a majority of the Electoral College votes (i.e., 270) is declared the victor.

Third, presidents serve fixed terms that are not dependent on the support or confidence of the legislature. Presidents, in most cases, serve 4- or 5-year terms, and at the end of a term, the president must either step down from the office or run for reelection. Put differently, presidents are not permitted to remain in office indefinitely, whereas (theoretically) prime ministers in some parliamentary governments are. It is worth noting, however, that certain provisions are in place in the event an official commits an egregious offense. For example, following the Bill Clinton–Monica Lewinsky scandal during the 1990s, the U.S. Congress impeached the president, although it did not remove him from office. Similarly, during the First Russian Republic, the Russian legislature sought to impeach Boris Yeltsin for his disastrous economic policies, the First Chechen War, and a host of other calamities. Thus, in most cases, there are mechanisms in place to remove from office a much maligned president, but in ordinary circumstances the president's term will conclude

after 4 or 5 years in most cases. And, unlike in parliamentary systems, the president's term is not susceptible to legislative approval. In parliamentary governments, a prime minister may be asked, or forced, to step down if he or she loses the confidence or support of his or her legislative counterparts. In contrast, a president can be eternally at odds with legislators and not jeopardize his or her political survival. Therefore, a presidential regime is also characterized by fixed terms, which are not contingent on legislative approval. This design is popular for numerous reasons, but it is not without its critics. These topics, though, will be elucidated later in this chapter.

That presidents retain the power to form their own cabinet is the fourth component of presidential structures. Having the authority to appoint cabinet members is a crucial tool at the president's disposal, and this can help the president pursue, and, it is hoped, fulfill, his or her campaign promises. Without this power, a president may have to resort to political negotiating with rivals to fill these positions. In such a scenario, a president's appointments may be delayed as a result of political wrangling between parties or candidates. Such occurrences may hinder a president's ability to carry out his or her mandate, and such a failure could have economic, social, or political repercussions. After all, if a president struggles to appoint defense, education, or economic ministers, then these agencies' ability to carry out changes in defense, education, or economic policies could be undermined. This authority is significantly different under parliamentary regimes, in which cabinet appointments are typically more of a cooperative endeavor.

The final primary attribute in presidential systems involves the executive's lawmaking authority. In some states, presidents have virtually no lawmaking authority. The U.S. president, for example, has some tools available to circumvent Congress's policy-making authority. He can issue executive decrees and executive treaties that can, but do not always, carry the same weight as congressional legislation. In other countries, however, presidential lawmaking authority rivals that of the legislature. As a result, some legislative authority and/or autonomy may be usurped by an overly ambitious executive. One such case is the Russian and Ukrainian presidencies, in which presidents have wielded considerable power (Protsyk, 2004). In contrast, the French executive is considerably different because of the accepted practice of *cohabitation*. During cohabitation, in which the legislature and executive are controlled by different political parties, the president often allows the prime minister to lead the government. This scenario can also include a president's *veto power*, whereby the executive can prevent a bill from becoming a law.

Appeals and Implications of Presidentialism

Before turning to the potential dangers of presidential governance, it is necessary to identify the positive attributes of these systems. To this extent, those who study regime

types have emphasized three primary aspects of presidential states that help us understand their appeal to politicians throughout the world. The three appeals include efficiency in political results and governance, the representativeness of the entire populace, and the checks and balances typically found in these governments.

As discussed earlier, efficiency is an attractive aspect of most presidential systems because of the information conveyed to voters. In particular, efficiency means that voters know, prior to casting a ballot, what the new government will look like. That is not to say that the outcomes are pre-ordained but rather that the most likely scenarios are widely known. This efficiency provides voters with a wealth of information as they decide which candidate to support. They also know that, if elected, their candidate should pursue with few obstacles or restrictions the policies supported by his or her electorate. Parliamentary systems, however, differ considerably. In some instances, the described scenario can, and does, unfold in parliamentary regimes. More common, however, is the formation of a coalition government. In such a situation, two or more parties join together in a coalition. Consequently, each party's demands or expectations are tempered as a result of the coalition formation exercise. Therefore, if a voter supported a conservative party, then the voter's preferred policies may not come to fruition because parties must compromise their positions in order to join the governing coalition. Furthermore, a singularly elected official (e.g., a president) may make it easier for voters to hold government officials accountable. At times, the president may be assigned too much blame if economic problems arise, but it is generally easier to punish one official than an entire legislature for lackluster economic policies. Therefore, efficiency is more apparent in presidential systems in comparison with parliamentary ones.

The second positive contribution of presidential regimes is the representativeness of one elected official. In parliamentary systems, with multiple political parties, it is likely that each party will represent only its supporters. For conservative voters, this means that their needs will be ignored if the majority winner is a liberal party that seeks to represent (or reward) its supporters. Such a possibility becomes even more complex if we consider a country with several political parties. Supporters of presidential governments, however, contend that this scenario is less likely to occur in a presidential state. They argue that presidents represent the entire country and, therefore, are beholden to the entire electorate rather than just a subset of the population. In 2000, when George W. Bush was declared president of the United States, he stated that he would represent the entire country rather than just his supporters, despite his narrow margin of victory. And 8 years later, Barack Obama made a similar pledge as president. Accordingly, a single elected official can, at least theoretically, be better positioned to represent an entire country than may be likely under parliamentary governments. Whether this happens is certainly debatable.

Presidential systems may also be preferred to parliamentary regimes because a presidential system balances representation with another branch of government. That is, most presidential regimes distribute powers among the branches of government. This arrangement provides multiple points for citizens to influence their government. If lobbying the president proves fruitless, then a concerned citizen can turn his or her attention to the legislature. Thus, states with popularly elected presidents can balance or distribute power over multiple branches of government. This institutional fragmentation can also prevent one branch from becoming too powerful and thus running roughshod over minority interests. Therefore, people from all ideological backgrounds should have some say in policy making as long as there are multiple political actors or institutions with some semblance of power. Because the electorate is represented by at least two different institutions (i.e., the legislature and the executive in this case), presidential systems can foment democratic stability by offering voters more opportunities to influence the policy-making process.

Theory: Identifying the Main Components of Parliamentary Regimes

Although presidential systems are common in the Western hemisphere, they are not the only option available to governments. In fact, presidential systems are in the minority when it comes to regime types found throughout the world. Parliamentary systems actually outnumber presidential states when we take stock of the entire global community. To many students of U.S. politics, parliamentary systems remain a foreign concept, and the inner workings of these regimes are equally befuddling. Accordingly, it is necessary to discuss the defining characteristics and operation of parliamentary governments before presenting the appeals of parliamentary systems and discussing an emerging type of government, generally referred to as *hybrid regimes*.

Often referred to as the *Westminster model*, after the United Kingdom's government, parliamentary systems differ from presidential states in several ways. One of the key defining characteristics of parliamentary systems is the fusion of the executive and legislative branches. Whereas the heads of state and government are often embodied in the same person in a presidential regime, parliamentary systems often separate the two roles. In addition, presidential systems generally have a separation of powers among the various branches of government, but such a clear allocation of responsibility is not found in most parliamentary regimes. Instead, parliamentary governments often combine the responsibilities of both the legislative and the executive branches.

After an initial election, in which voters decide how many seats are allocated to the various political parties, the elected representatives in a parliamentary system are then given the task of establishing or forming the government. Not only do these individuals have to organize the

legislative branch, but they are also charged with structuring the executive branch. Legislative officials determine who will serve as the head of the government (or who will serve as the prime minister or premier), which politicians will fill the various cabinet positions, and who will head the various legislative committees. If there is a clear majority winner in the initial elections, then government formation is fairly straightforward, and typically no coalition is formed. In other instances, however, where there is no majority party, the party with the most seats (often referred to as the *formateur* party) is responsible for constructing the governing coalition. This party will seek a coalition partner—or sometimes multiple partners—and, after cobbling together enough support to give the coalition a majority of seats, the parties involved will then jointly determine the prime minister, cabinet positions, and other leadership posts. Although this is the norm, there are cases when a coalition government is not formed, even in the absence of a majority winner. Currently, the Canadian government has a minority government led by the Conservative Party. In the Canadian case, there is no majority party, and coalition formation efforts have proved futile. Consequently, the Conservative Party, by default, is the *de facto* governing party even though it lacks a clear majority of seats.

Cabinet dominance is another important feature of parliamentary democracies (Lijphart, 1999). On forming the ruling coalition, those in power make a number of key appointments, although none more powerful than that of the prime minister. The prime minister is enlisted to serve at the behest of the governing majority and will do so until he or she loses the support of the legislature. When the prime minister loses support of the legislature, as evidenced through a *vote of no confidence*, then new elections must be held. An alternative practice is the *vote of confidence*, which is an act initiated by the government. Here, if the ruling government is incapable of securing a majority of the votes in the legislature, then the government must step down (Clark, Golder, & Golder, 2009). Some states use a slightly different version of the confidence vote, referred to as a *constructive vote of confidence*. In Germany and Hungary, two countries where such a tool is in use, the legislature must agree on a replacement government prior to dissolving the extant body.

Predictably, cooperation among politicians is very important in parliamentary systems, for without it, all elected officials must run for reelection and thus risk losing their positions. Lacking party discipline or cooperation, the government is likely to collapse. This is exactly what has happened recently in the Czech Republic. Like so many other countries in the past few years, the Czech Republic was plagued by the recent global economic downturn, and when economic troubles combined with internal political strife, it was hardly surprising that the governing coalition lost its grasp on power.

Although coalitional survival is predicated on party discipline and cooperation, the most prominent or powerful

actor in most parliamentary governments is the prime minister. Prime ministers are elected by their governing coalition; but not all prime ministers are equally powerful. Indeed, Giovanni Sartori (1994) explains that there are at least three scenarios common to most parliamentary governments: A prime minister may be *first above unequals*, *first among unequals*, or *first among equals*. The power of the prime minister is greatest in the first case (i.e., first above unequals), examples of which can be found in places such as Germany, Greece, and the United Kingdom (Lijphart, 1999). In contrast, among the weakest prime ministers (i.e., first among equals) are the heads of government in Italy, the Netherlands, and Norway (Lijphart, 1999). How does one discern between powerful and weak prime ministers? Typically, researchers have relied on the prime minister's authority vis-à-vis fellow members of the executive branch (e.g., the Exchequer in the United Kingdom compared with the prime minister), the prime minister's ability to navigate through the policy-making process, and his or her ability to remove and appoint members of the executive branch. These are but a few examples of how we can measure prime ministerial strength; many more examples can be found in other sources (see King, 1994; Lijphart, 1999).

Beyond these features, what other defining characteristics do we see in parliamentary governments? Other than the aforementioned lack of separation between the legislature and executive, a few additional attributes are worth stressing. In particular, parliamentary governments are often more conducive to cooperation. Because their political survival depends on cooperation, members of the legislature are more willing to work with the executive branch than are legislatures in presidential regimes. In addition, although established and fully functioning judiciaries are common in many democracies, the separation of powers or checks and balances between the legislative and executive branches found in many presidential governments is often missing from parliamentary governments.

In most parliamentary governments, we also see the use of a *proportional representation* (PR) electoral system to translate votes into legislative seats. There are some exceptions to this. Great Britain and India each employ a *single member district* (SMD) plurality electoral system to fill legislative seats. The use of the SMD electoral system in Great Britain has largely favored the two major parties—the Conservatives and the Labour Party—at the expense of the Liberal Democrats. Although there are other examples of parliamentary systems that use SMD electoral systems, more often than not parliamentary systems employ a PR system. Under these electoral systems, we typically see the emergence of multiple-party systems because more seats per electoral district are up for grabs. Maurice Duverger (1954), a noted French political scientist, observed many years ago that PR systems typically produce multiparty systems while SMD systems typically have a constraining effect on the number of political parties. More specifically, he explained that most SMD systems should produce

two-party systems like those seen in the United States and, to a similar degree, the United Kingdom.

Multiple-party systems are often found in parliamentary governments that use PR electoral systems. This can be especially attractive to highly fragmented societies. In fact, given the deep sectarian divides in Iraq, it should not be surprising that the architects of this young democracy opted for a parliamentary style of governance with a PR electoral system. This structure enables Iraqi leaders to represent a multitude of diverse interests—including political, ethnic, religious, and geographic. The choice of government type and electoral system is a significant decision; indeed, this setup should allow multiple parties to participate in the policy-making process, which should, at least in theory, temper Iraqi tensions. That parliamentary governments with PR electoral systems are better able to represent multiple interests is one of the more attractive features of this regime type.

Another distinguishing feature of parliamentary governments is the absence of fixed terms. The confidence votes used to sustain a coalition government suggest that a government can fail at any time. Although most parliamentary states have provisions that require elections to be held every 4 or 5 years, virtually all parliamentary terms can be cut short. Elections that may be held at any time are also referred to as *endogenously timed elections*. Recent political science research has found that politicians may use this feature to extend their political careers: When a government is viewed in a positive manner, elections may be called earlier to capitalize on this success, but when public approval ratings are low or decreasing, then the governing coalition will often postpone elections. Others, however, have found that since political leaders possess more accurate information than voters, early elections will be held if elected officials anticipate political strife or economic turmoil (Smith, 2003). As a corollary, other works have found that voters are cognizant of this practice and, in some cases, may punish coalition members for holding elections too early. Nevertheless, this is an attractive feature of the Westminster model as it gives the electorate more tools to keep tabs on elected officials.

Appeals and Implications of Parliamentary Governments

Parliamentary systems offer several remedies to the majoritarian tendencies common to most presidential governments. For starters, many suggest that accountability is in fact greater in parliamentary—not presidential—systems. While ineffective presidents could scapegoat their rivals in the legislature, this argument is unconvincing for leaders in parliamentary systems. Because there is no other actor who can thwart policy making, coalition members are more accountable for the results of their policies. As one can imagine, this is a double-edged sword. On one hand, if the government's policies are utterly disastrous, then everyone knows whom to blame. Thus, it is easy to

remove from power those responsible for the ineffective or harmful policies. On the other hand, if a government's policies prove to be a rousing success, then this can certainly work to the coalition members' advantage. Because it was the coalition's steady hand alone that implemented the policies responsible for economic growth, political stability, and so forth, its members are poised to be the lone beneficiaries of the policies in question. As such, advocates of the parliamentary model would suggest that this style of governance is better able to reward or punish the politicians at the helm of the state apparatus.

Similarly, the presence of endogenously timed elections is also seen as a boon for accountability and, by extension, democratic stability. This mechanism rewards popular or highly regarded politicians for their policies by granting them an extended tenure. One of the arguments against presidentialism is that if a president has done an excellent job, he or she still must run for reelection at the end of a term. But in parliamentary systems, if those in power are highly regarded, then there is no need to hold elections (again, there are exceptions to this). Equally telling, though, is the constant threat of dissolving the government. If a country's political or economic climate has suffered at the hands of a coalition government, then that government can be removed from office at any time. This enables voters to oust unpopular politicians at any time, which is an improvement over presidential structures. Barring any significant scandal or an attempted coup d'état, most presidents cannot be removed from office until the expiration of their term. Consequently, a nefarious or incompetent president cannot be removed prematurely (unless impeachment proceedings are initiated), thus enabling the president to wreak further havoc on a country's livelihood.

Finally, parliamentary systems are thought to be more conducive to political party formation, especially multi-party systems. While this likelihood is partly attributed to the frequent use of PR electoral systems in parliamentary governments, party systems also thrive under parliamentary governments because of the incentives to create and sustain parties in this type of regime. As Duverger noted long ago, PR contests foment multiparty systems. This notwithstanding, it is also worth noting that presidential systems tend to constrain party-building efforts. After all, if a president is endowed with adequate constitutional power with respect to the legislature, then he or she need not be overly concerned with working with the legislature. Furthermore, when presidents can circumvent the legislature, there is little incentive for legislators to build or maintain political parties. Thus, political parties may be less instrumental in lawmaking under presidential regimes. Conversely, in parliamentary governments, political parties are effective vehicles for overcoming collective action problems that often surface in legislative bodies (Aldrich, 1995). Creating and maintaining parties, moreover, can help legislators overcome collective action problems through organizing members, delivering necessary

information, and rewarding loyal rank-and-file members. By providing these benefits, individual legislators will succumb to the party in hopes of furthering their careers. And, in exchange for this loyalty, parties are better able to legislate given this increased party discipline. Without political parties, parliamentary systems could become immobilized due to the rampant chaos stemming from the lack of organization and structure. Likewise, we can point to the Weimar Republic in Germany and the French Fourth Republic as two examples of what happens when party organizations are incipient or unable to coerce discipline from their rank-and-file members. In both cases, the weak parties populating the political landscape undermined policy-making efforts.

Perils of Presidentialism: Do Presidential Systems Produce Democratic Instability?

The decision of whether to implement a parliamentary or a presidential system has engendered a healthy debate among scholars. Much of this discussion was fueled in part by the experience of Latin America, where many countries implemented presidential systems that would collapse years later. Because of this turbulent regional experience, a number of scholars were quick to write off presidential regimes because, they argued, these systems would undermine democracy and lead to political unrest. The reasons for this skepticism rest on four primary criticisms. Ostensibly, the argument contends that presidentialism hinders democratic survival due to the prevalence of minority governments, frequent legislative impasses, the lack of durable coalitions, and the propensity of the executives to exploit constitutional authority for their own benefit.

At their core, presidential systems are essentially majoritarian, winner-takes-all contests. That is, the second-place finisher receives nothing in return for his or her strong showing. When George W. Bush narrowly edged out Al Gore in the Electoral College in the 2000 U.S. presidential election, there was no consolation prize for then Vice President Gore even though he had in fact won the popular vote. Given this, the winner of a presidential contest has considerable authority and can do as he or she pleases. Furthermore, if the losing candidate is or was serving in the legislature, then the victorious candidate has little incentive to work with his or her former opponent. This situation can result in a political stalemate that could prompt drastic measures that could have a devastating effect on the overall political system.

Furthermore, because there is only one president, presidential systems also tend to produce minority governments. One excellent example of such a scenario is Chile's Allende, who became president after winning only slightly more than 30% of the popular vote. A similar case is the 2002 French presidential elections. Due to pervasive frustration with their government, much of the French electorate voted against

familiar candidates, and nearly 20% of voters supported the right wing candidate Jean-Marie Le Pen—a caustic individual whose campaign has been described as xenophobic if not anti-Semitic in many instances. In France's two-round presidential contest, Le Pen was one of two candidates to make it to the second round, in which he was soundly defeated by Jacques Chirac. Nevertheless, these examples, particularly Allende's story, serve as subtle reminders that presidentialism may result in minority governments. Furthermore, in the case of Le Pen, had he been elected, it is plausible that his policies would have contrasted sharply with the views of much of the French electorate, thus causing a potentially dangerous scenario.

Another reason presidents may hinder democratic survival stems from what is commonly referred to as dual democratic legitimacies. Because presidents and legislators are elected in separate contests—unlike in parliamentary systems—it is possible, if not probable, that both the legislative and executive branches of government may claim separate political mandates. If there are rules or provisions in place to guide the government through these potentially rough waters, then there is little cause for concern. However, in most cases, there is little clarity in doling out responsibilities between these branches of government, in which case, any showdown between the legislature and the president could result in a political stalemate and, possibly, democratic collapse. The latter is certainly not a given, but at the very least, legislative gridlock is likely to ensue. If a political shutdown does not result, the separate mandates of each branch could result in an impasse that could at least stall policy making, which could deprive government agencies, citizens, and politicians of potentially valuable policies or funding that is needed to keep society running smoothly.

Additionally, if the president and legislative majority hold different or contrasting ideological backgrounds or partisan affiliations, then any quasi coalition will likely be short-lived. Admittedly, this is certainly not a given, but it is a likely outcome when the president and legislature hold different views on the direction of a given country. And since there are few incentives for these actors to work together, coalitional stability is likely to be tenuous at best. This instability could slow the political process as these institutions battle for influence, thus resulting in delayed or nonexistent policy making. If policy making does not grind to a halt, then an alternative scenario exists whereby presidents would simply eschew the traditional lawmaking process and opt for extralegal options. This too could precipitate a political showdown that could trigger a democratic crisis or, worse yet, collapse.

Faced with this scenario, many presidents were quick to exploit the constitution for their own personal gains. This potential consequence of presidentialism is based on numerous experiences in Latin America, where presidents attempted to cling to power even when faced with mounting opposition from the legislature and/or the polity. This consequence can be viewed as the culmination of the other

components identified thus far. In the event that a president seeks to rewrite, distort, or even ignore the constitution, the fate of democracy has been sealed, and it will be on the brink of collapse.

Although much has been written about the potential perils of presidentialism, this debate remains ongoing. Other scholars have questioned this contention and have countered that presidential systems are not inherently dangerous. For example, Donald Horowitz (1990) takes umbrage with a number of Juan Linz's conjectures. First, Horowitz points out that Linz's evidence is predominantly based on the Latin American experience and neglects stable presidencies found in other regions. Second, Horowitz maintains that the perils of presidentialism are based primarily on exaggerated interpretations of these systems that do not represent all presidential states. It is important to note that Horowitz also points out several instances in which parliamentary systems have prompted instability. Among others, Nigeria is mentioned as one case in which parliamentarism has resulted in an unstable polity. Another point of contention stems from the confusion surrounding presidential systems and electoral systems. Those subscribing to the perils-of-presidentialism school of thought have essentially confused presidential systems with electoral systems, thus producing some misguided conclusions. For example, the single member plurality systems used to elect many presidents often result in disproportional outcomes that potentially exacerbate underlying social, political, or geographic tensions. Finally, those questioning the dangers of presidentialism also point out that the potentially beneficial aspects of presidential systems have been largely overlooked, which has provided a rather biased view of these regimes.

Although useful, this theoretical discussion does not provide much empirical evidence of the dangers of presidentialism. Fortunately, a number of political scientists have used a variety of statistical techniques to evaluate the perils-of-presidentialism argument. Alfred Stepan and Cindy Skach (1993) have reviewed several constitutional frameworks, along with a host of other data sources, and have discovered that presidentialism is indeed correlated with weaker democracies. Not surprisingly, others have reached much different conclusions. In their study of more than 50 countries, Timothy Power and Mark Gasiorowski's (1997) findings refute the dangers of presidentialism. In the most comprehensive work to date, Jose Antonio Cheibub (2007) has echoed Power and Gasiorowski's conclusions. Cheibub (2007) asserts that it is not presidential systems that are dangerous; rather, he demonstrates that it is the underlying social conditions or background characteristics that jeopardize democratic stability. Specifically, he suggests that whether or not a military regime had previously existed is far more important than whether a presidential system is in place. Because many Latin American countries have had experiences with military dictatorships, Cheibub's findings put Linz's theoretical work in a new perspective.

Future Directions

Clearly, much has been written on the topic of regime choice. Convincing arguments have been made on both sides of the debates—those warning of the perils of presidentialism and those questioning this assertion. Cheibub's work is a compelling study of the presidentialism argument; here, the author disaggregates the various components of the presidentialism argument and finds that statistical evidence dispels many of the concerns espoused by the camp opposed to presidentialism. This work, however, does not address every concern. In fact, Cheibub goes on to say that testing the relationship between political party discipline and presidents is impaired by our inability to measure party discipline cross-nationally. Aside from this empirical problem, there are other concerns with how we measure these regimes. Although scholars such as Alan Siaroff (2003) include several considerations to measure presidential strength, our ability to clearly distinguish presidential states from parliamentary ones is still a work in progress. This issue is further complicated when we take into account the large number of hybrid systems that are also particularly elusive in categorizing regime type.

Conclusion

There are several different ways a country can set up its own government. It can take the form of a presidential, parliamentary, or hybrid regime. To be sure, there are attractive aspects of each regime, but it should not be surprising that many newer democracies have opted for a hybrid regime that seeks the best of both worlds. For example, several former Communist states, such as Croatia, Lithuania, Poland, and Ukraine, have opted for semipresidential regimes, in part to mitigate the shortcomings of either presidential or parliamentary systems (Clark, Golder, & Golder, 2009). Having said that, simply because a country opts for a presidential regime does not necessarily precipitate democratic collapse. For some time, scholars had reasoned that presidential systems were anathema to democracy, but contemporary analysis has largely disputed this finding. Thus, presidential systems may not be as perilous as Linz and others have forecast. This is not to suggest that regime type is insignificant. Rather, regime type remains an important distinction, and it is imperative that we understand the costs and benefits of different regime types in order to minimize the potential negative consequences for a given country.

COMPARATIVE JUDICIAL POLITICS

DAVID L. WEIDEN

Indiana University–Purdue University Indianapolis

The study of courts in comparative perspective has a long history in the discipline of political science. C. Neal Tate (2002a) notes that articles dealing with international judicial systems were published nearly 100 years ago in some of the first American political science journals. However, the study of comparative judicial politics faded from the forefront of the discipline of political science for several generations, until social scientists began to again analyze legal systems comparatively, starting in the 1960s. In the last several decades, there has been a virtual explosion of research dealing with judicial structures and processes in comparative perspective. This chapter provides an overview of some of the most significant recent research on comparative courts and also examines the trends and future directions for comparative judicial scholarship. Obviously, only the general trends in comparative courts scholarship can be discussed here due to space limitations; for a more detailed listing of work in the field, the reader is advised to consult Tate (2002a, 2002b), which provides a comprehensive bibliography of books and articles in the subfield of comparative judicial systems.

This chapter first reviews the primary theories of judicial decision making, then examines constitutional and appellate courts in comparative perspective, including the differing forms of judicial review found throughout the world, then provides an overview of comparative trial systems, and concludes with suggestions for future directions in comparative judicial politics research.

Courts and Legal Systems

The study of courts in comparative perspective requires that one first determine exactly what constitutes a court. Early work in the comparative study of judicial systems attempted to provide this definition. An important study is Theodore Becker's *Comparative Judicial Politics: The Political Functionings of Courts* (1970). In this study, Becker defined a *court* as follows:

- (1) a man or body of men (2) with power to decide a dispute, (3) before whom the parties or advocates or their surrogates present the facts of a dispute and cite existent, expressed, primary normative principles (in statutes, constitutions, rules, previous cases) that (4) are applied by that man or those men, (5) who believe that they should listen to the presentation of facts and apply such cited normative principles impartially, objectively, or with detachment, . . . and (6) that they may so decide, and (7) as an independent body. (p. 13)

A functionalist definition of *court* is given by Martin Shapiro in his important book *Courts: A Comparative and Political Analysis* (1981). Shapiro suggests that courts serve three major functions: conflict resolution, social control, and lawmaking. By *lawmaking*, Shapiro refers to interstitial lawmaking, which consists of filling in the gaps in statutory or customary law, and also to the judicial creation of law and policy. He notes that, although the existence of

judicial policy making is frequently denied, the phenomenon exists in all courts and judicial systems.

These early works are notable because they laid out the foundations on which more advanced analyses in comparative judicial politics could be conducted. The examination of comparative court systems is complicated by the fact that there are three general types of legal systems found in the world: common law, civil law, and religious law. The jurisprudence, judicial role, and organization of courts vary widely in each of these legal systems. Put most simply, *common law* legal systems are found primarily in Anglo-American nations, and the principle of precedent—following the legal principle established in previous court cases—is one of the chief elements of this legal system. *Civil law* systems, found in Continental Europe, Latin America, and much of the rest of the world, generally do not rely on the principle of precedent but instead use extensive codification and written codes to guide judges in their decision making. Finally, the great variety of *religious law* systems, found in the Middle East and elsewhere, rely extensively on the principles found in sacred texts to direct judges in their duties (see, generally, Merryman, 1985).

Clearly, the wide variance in the types of courts and legal systems has presented significant obstacles for researchers seeking to understand and elucidate legal phenomena across national borders. Thus, the most common type of research in comparative judicial research is the single-country or single-court study, which seeks to explain and predict judicial behavior in one court only. This type of research is quite valuable in that the frontiers of knowledge about that particular court are expanded; however, the limitation of this work is that the ability to apply the findings to other courts may be limited. Nonetheless, in the past several decades, researchers have made significant progress in the field of comparative judicial politics by conducting increasing numbers of both single-court and cross-national judicial studies.

Comparative Judicial Decision Making

A great deal of research in law and courts scholarship deals with judicial decision making. In other words, one of the central endeavors for political scientists who study judges and courts is to explain and predict how and why judges rule in certain types of cases. The attempt to understand this particular form of judicial behavior has been limited largely to analyses of appellate courts in the U.S. system. However, an increasing amount of work is being devoted to examining this phenomenon in comparative perspective. Research has been carried out analyzing the high courts of, among others, Latin American, European, and Middle Eastern nations, as well as Australia and Canada. In addition, courts in both democratic and authoritarian regimes have been studied (see, e.g., Ginsburg & Moustafa, 2008). Many political scientists have sought to test the judicial behavior

of appellate court judges outside the United States by using one of the primary theories of judicial decision making: the *legal*, *attitudinal*, and *strategic* models. The sections that follow provide a brief overview of each of these approaches, as well as the utility of each for explaining judicial behavior across nations and courts.

The Legal Model of Judicial Decision Making

The legal model is the traditional theory of how judges in common law legal systems decide cases. In its simplest form, the legal model proposes that judges make decisions on the merits of a particular case by interpreting the facts of the case through referring to the plain meaning of the relevant statute or constitutional provision, precedent in prior cases, and legislative and original intent of those who drafted the law or constitution (Segal & Spaeth, 2002). So the legal model posits that judges will not use their personal political or partisan values when deciding cases, but only legal factors. In other words, according to the theory, judges will weigh and balance prior precedents, statutes, and constitutional provisions when deciding the outcomes of cases. Again, the individual political ideology of a particular judge is not expected to influence the decision on a case, because judges will focus exclusively on the legal factors. Indeed, judges themselves almost always maintain that they decide cases only according to legal factors, and they usually deny allowing personal policy preferences to influence their voting (Spaeth, 1995). Thus, the legal model of judicial decision making holds that the law, not personal political preferences, will drive the decision-making process of judges.

In comparative perspective, the legal model is not well suited to explain judicial behavior outside common law nations. Because judges in civil law legal systems generally do not rely on the precedent established in previous cases, the legal model as usually formulated does not apply in these courts. It is possible that a modified legal model could be formulated to measure the behavior of judges in civil law courts. However, to date, almost all political scientists have abandoned the legal model framework when studying the behavior of judges outside common law legal systems.

The Attitudinal Model of Judicial Decision Making

Perhaps not surprisingly, many American political scientists have rejected the legal model of judicial decision making and instead have embraced an alternative theory: the attitudinal model. The attitudinal model received its most thorough treatment in Jeffrey Segal and Harold Spaeth's 1993 book, *The Supreme Court and the Attitudinal Model*, and their follow-up volume, *The Supreme Court and the Attitudinal Model Revisited* (2002). Segal and Spaeth argue that the attitudinal model represents a melding of

key concepts from legal realism, political science, psychology, and economics (2002).

Stated most simply, the theory holds that judges tend to vote according to their political preferences, attitudes, and ideologies and not according to the relevant doctrine, legislative intent, or legal precedent of a particular case. Spaeth (1995) contends that the justices vote as they do because they want their decisions to reflect their individual policy preferences. A number of factors are present at the U.S. Supreme Court that encourage attitudinal voting by judges, and these factors generally apply to judges in other common law high courts as well.

First, Supreme Court justices have no ambition for higher judicial office, so the judges usually do not have to consider the consequences of their decisions on the merits of a case (Segal & Spaeth, 2002). In other words, because the U.S. Supreme Court is the highest tribunal in the system, the judges do not have to worry about having their record scrutinized and possibly being denied a promotion to a higher court in the future. Nor do U.S. Supreme Court judges typically seek political office, so there is no fear of political accountability either. Segal and Spaeth also note that Supreme Court justices are immune from electoral accountability. Although many U.S. states employ periodic judicial elections, federal judges enjoy life tenure, and thus there is no fear of losing their office in an election because of their voting record.

Segal and Spaeth (2002) also observe that the U.S. Supreme Court is a court of last resort that has complete control of its docket. That is, the members of the Supreme Court have nearly total discretion as to which cases will be accepted for judicial review. This ensures that cases that are completely without merit or are totally one-sided will usually be screened out. Only those cases that present a genuine dispute between two legally defensible positions will be accepted by the Court. So, the fact that the members of the Supreme Court control their caseload usually ensures that only cases with solid legal justification for both litigants will be accepted, which should encourage attitudinal voting. Furthermore, because the Supreme Court is at the top of the judicial pyramid in the United States, there is no possibility of a higher court's reversing the Supreme Court's decision on a particular case.

Because of all these institutional arrangements—life tenure for its judges, control of the Court's caseload, lack of political or electoral sanctions, court of last resort—the judges at the U.S. Supreme Court are completely free to decide cases on the basis of personal attitudes, values, and ideologies, not the law, according to the attitudinal model of judicial decision making. Spaeth (1995) does note that there are some potential limitations to the attitudinal model. First, it is unclear whether the attitudinal model of judicial decision making applies to lower appellate courts, because of the restrictions under which these judges operate. Specifically, the possibility for judicial (or political) promotion could limit the tendency of these judges to vote their true preferences, as could the possibility of reversal by a higher court. Furthermore, most lower appellate courts do

not have complete control over their docket, which means that many cases lacking a genuine legal conflict must be accepted in these courts.

Whether the attitudinal model can be used extensively to analyze judicial behavior outside the United States remains an open question. Empirical research on high courts in Canada and Australia has demonstrated that the attitudinal model can be used to analyze judicial behavior in those nations and that attitudinal voting has been empirically observed in courts outside the United States (see, e.g., Ostberg & Wetstein, 2007; Weiden, 2010). However, the attitudinal model may be difficult to apply in other nations' courts because of the difficulty in discerning the ideology of individual judges in these systems, and also because some high courts do not release individual-level opinions but rather rely on one single court-level judgment. In other words, if a high court does not indicate in its opinions which judges voted with the majority and which judges dissented, then it may be difficult to analyze individual judges' behavior accurately, which is a necessary component of the analysis of judicial decision making with the attitudinal model.

The Strategic Model of Judicial Decision Making

The third theory of judicial behavior is the strategic model. The strategic model borrows some of its central assumptions from the field of economics and, more specifically, from what is known as *rational choice theory*. Stated simply, the strategic model accepts that judges will vote according to their policy preferences, but in order to maximize those preferences, judges will take into account the voting of the other members of the court and thus cast their votes strategically (see generally Epstein & Knight, 1998). In other words, strategic judges are not unconstrained actors but must weigh the preferences of other actors when making decisions on cases. Many attempts to formally model strategic decision making at the U.S. Supreme Court rely on game-theoretical accounts to demonstrate that some element of judicial decision making was "sophisticated" (i.e., took into account the preferences of other judges) rather than "sincere" (i.e., was a pure example of a judge's voting for his or her policy preferences, without regard to other judges' actions).

There is continued debate over the utility and explanatory power of the strategic model and rational choice theory overall (see generally Green & Shapiro, 1996). However, some of the strongest research in comparative judicial politics has used formal models to analyze and explain the behavior of judges outside the United States (see, e.g., Helmke, 2002; Vanberg, 2001). Because the strategic model of judicial behavior does not rely exclusively on individual-judge-level data that may not always be available, it is well suited to the analysis of comparative judicial politics. Indeed, these formal models of judicial behavior are crucial in generating theories of the judicial process that can be tested empirically against actual court data.

Constitutional and Appellate Courts in Comparative Perspective

Recent work on constitutional courts outside the United States has demonstrated that some political systems are becoming increasingly “judicialized” (Stone, 1992a, 1992b; Tate & Vallinder, 1995). That is, legislators and executives must anticipate the rulings of high courts and frequently alter their policies in advance of adoption to avoid nullification (Tate & Vallinder, 1995). Of course, this phenomenon has always existed to some degree, but it seems clear that this tendency has increased to the point that it can be said with confidence that, in many nations, the political process has been “constitutionalized” (Shapiro & Stone, 1994). Indeed, some commentators have noted that European constitutional courts may now operate as third legislative chambers (Shapiro & Stone, 1994; Stone, 1992b). In some parliaments in which the representatives are weak and dominated by the executive, the constitutional court may be a more effective policy-maker than the parliament itself, in this new era of the judicialization of politics (Stone, 1992a). Martin Shapiro and Alec Stone (1994) note that judges in some European constitutional courts “actually provide the draft statutory language that the judges say they would find constitutional” (p. 404) after reviewing a particular policy. Although the policy-making authority of constitutional courts varies by country, the fact that these courts are well established as policymakers is undeniable.

The judicialization of politics has had other consequences, as well. Scholars have observed that a constitutional politics of rights has become increasingly present, especially in Europe. Shapiro and Stone (1994) describe the constitutionalization of politics as follows:

[It] easily comes to infect the entire political system because opposition political parties, lawyers, citizen groups, and others can see that rights claims are an effective avenue of social change. These actors have become, in essence, the political constituencies of the judges and of constitutional review. (p. 417)

The increase in rights claims and rights discourse has been observed outside Europe as well. Charles Epp (1998) argues that the explosion in rights-based litigation is due primarily to what he terms the “support structure” for legal mobilization, rather than bills of rights, judicial independence, judicial leadership, or any structural explanations. By “support structure,” Epp refers to the financial resources and legal expertise that allow litigants to pursue claims that they almost certainly could not finance on their own. Building on the well-developed legal mobilization literature in the United States, Epp adds another piece to the study of comparative courts.

No discussion of comparative constitutional politics would be complete without mention of the supranational development of constitutional politics. The case law of European Union tribunals such as the European Court of Justice, the European Court of Human Rights, and the

International Court of Justice is often used as precedent in cases before European constitutional courts. Additionally, the European Conference of Constitutional Tribunals, which is composed of all the presidents of the highest courts in Europe, meets regularly at conferences in which their rulings are discussed among each other. Thus, the constitutionalization of the political process is proceeding within national boundaries and is also being encouraged at the supranational level. The tendencies have combined to increase the judicialization of politics in Europe and throughout the world.

Judicial Review in Comparative Perspective

Judicial review is the ability of a court to overturn a piece of legislation, an act of the executive, or a lower court decision. However, judicial review powers vary widely by country and by court. A number of studies have examined judicial review comparatively in an attempt to provide a better understanding of how the practice of judicial review differs around the globe. Indeed, Donald Jackson and Tate’s (1992) *Comparative Judicial Review and Public Policy* provides a series of useful essays describing and comparing the differing forms of judicial review found in the world. The authors note two important distinctions in types of judicial review:

1. *A posteriori* (or *concrete*) review, in which judicial review occurs only after the statute has already taken effect and there is a concrete case or controversy extant, versus *a priori* (or *abstract*) review, in which judicial review may take place before a law takes effect and thus without an actual case or controversy. Stone (1992a) notes that this dichotomy is not exactly accurate, as abstract review can exist *a posteriori*, as in Austria, Portugal, Spain, or West Germany, or *a priori*, as in France.
2. The *all courts model of judicial review* (used in the United States), in which any court at any level may declare a statute unconstitutional, versus the *constitutional courts model of judicial review*, wherein only a specially designated court may review a challenged statute’s constitutionality (Tate, 1992).

In addition, an excellent cross-national study of the formation of constitutional review in new democracies, demonstrating how judicial review serves the interests of political actors during regime change, is found in Tom Ginsburg (2003). Another theory analyzing cross-national constitutionalization is described by Ran Hirschl (2004). This theory is termed *hegemonic preservation*, and it holds that the growth of judicial power is explained by interplay of the self-interest of political actors, economic elites, and judicial notables—all of whom work to create constitutional reform in a manner that serves their own agenda.

Another trend in judicial review in comparative perspective deals with the introduction of the international European Convention on Human Rights. This international agreement may be having a significant impact on the jurisprudence of the United Kingdom, which has traditionally eschewed judicial review of legislation in favor of the centuries-old tradition of *parliamentary supremacy*.

David Weiden (2009b) empirically analyzes recent court cases in Northern Ireland and finds that litigants are now willing to invoke the protections of the European Convention on Human Rights in domestic courts and request that British laws be overturned through the process of a *declaration of incompatibility*. In other words, the long-held principle of parliamentary supremacy in Britain may be slowly giving way to the principle of judicial review, which has never truly existed in the United Kingdom. To be sure, this is a very recent development in Britain, and additional research in coming decades and in other British courts will allow for further confirmation of this trend.

Judicial Independence in Comparative Perspective

The concept of judicial independence is closely related to judicial review and has been another area wherein a great deal of comparative research has been conducted. *Judicial independence*, in its simplest sense, refers to the degree of freedom that judges have from other political actors. In other words, the study of judicial independence examines whether judges can make decisions without being influenced by policymakers and elected officials. A number of institutional features can increase judicial independence. For example, life tenure for judges (rather than fixed terms) ensures that they can decide cases without fear of retaliation from the executive or legislature. However, the ability for judges to make decisions freely is a double-edged sword because judicial decisions that diverge too greatly from public opinion can result in a loss of support for the court, perhaps damaging the court's legitimacy. This danger is especially evident for judges in emerging democracies. Ginsburg (2003; see also Epstein, Knight, & Shvetsova, 2001) found that, in the early years of a court's existence, judges in these developing nations are less likely to make rulings that challenge other political actors.

Party Capability Research

A continuing debate in law and courts scholarship has been whether litigants with more resources are more likely to win their cases than are those who do not possess such resources, an issue referred to as *party capability*. This debate was first described in Marc Galanter's (1974) classic article that examined this question in American appellate courts and found that litigants that are "repeat players" (as opposed to "one shotters") and have greater resources are more likely to prevail in appellate litigation.

The question of whether parties with greater resources tend to prevail in litigation is well suited to comparative judicial analysis. Peter McCormick (1993) examined whether governmental litigants are more successful than private litigants in litigation and found that repeat players are more likely than one shotters are to experience success in the Supreme Court of Canada. However, in Australia, a similar study found that there is little evidence to support the conclusion that litigants with greater resources are

more successful at the High Court (Smyth, 2000). The difference in the results between the Canadian and Australian high courts regarding party capability is striking and raises the question of whether the party capability thesis applies only to certain courts.

The most comprehensive comparative examination of Galanter's (1974) thesis to date is by Stacia Haynie, Tate, Reginald Sheehan, and Donald Songer (2001). These authors examined party capability theory in the high courts of Australia, Canada, England, India, the Philippines, South Africa, and Tanzania. They found that the party capability thesis was strongly supported in the high courts of Canada, Great Britain, and Tanzania but less so in the other cases in the study. Thus, the question as to whether the party capability thesis is generalizable across nations and courts remains open. Further research in additional countries and judicial systems may help answer these questions and constitutes a promising area for additional comparative courts research.

Trial Courts and Juries in Comparative Perspective

In contrast with the well-developed literature on appellate courts, political scientists have conducted little research on trial courts in comparative perspective. Indeed, most of the empirical and interpretive work on comparative trial courts has been done by economists, criminal justice specialists, and law professors. This is somewhat surprising because there are large differences in the trial procedures and processes used in Anglo-American countries and those used in the rest of the world, and these differences present many interesting empirical questions. The trial system used in Anglo-American nations is known as the *adversarial model* and is premised on the assumption that the truth in a court case will be revealed most efficiently through a competition between the litigants, and then the ultimate decision in the case will usually be made by a jury. By contrast, the trial system generally used in Continental Europe, Africa, Latin America, and Asia is the *inquisitorial model*. This trial system is less confrontational than the adversarial model, but instead is more akin to an investigation wherein the judges control the proceedings, call and question the witnesses, and also make the ultimate determination in the case.

Clearly, the fundamentally different approaches toward the administration of a trial found across the globe present intriguing comparative issues for social scientists. The economists Bruno Deffains and Dominique Demougin (2008; see also Block & Parker, 2004) conducted experimental research analyzing whether the adversarial or inquisitorial trial system tended to be more equitable; they found that the adversarial trial system could lead to inequality and inefficiency, at least in criminal cases. These researchers naturally brought an economic focus to their studies; political scientists should be able to add additional political and legal variables to these analyses.

Another area that has been little studied is that of juries in comparative perspective. The trial jury was developed in

England and is still found there, as well as in former British colonies: the United States, Canada, Australia, New Zealand, Ireland, and dozens more nations around the world. Neil Vidmar (2000) reports that the trial jury has been eliminated in most systems for civil trials but is still widely used in criminal cases in those nations retaining a jury system. Given that the trial jury remains ubiquitous in most common law legal systems, a comparative analysis of juries could yield numerous insights for comparative judicial researchers. However, to date, the comparative study of juries remains largely the domain of law professors. Vidmar's *World Jury Systems* is the single best volume on comparative jury research, consisting of a number of essays describing the jury system in particular countries, as well as an invaluable introductory essay. However, true empirical cross-national research on juries remains to be conducted.

Future Directions

The field of comparative judicial systems is still relatively young, and many avenues remain available for new empirical and interpretive research. As noted above, cross-national empirical judicial research (as opposed to single-country studies) remains less common within the field of political science (but see, e.g., Epp, 1998; Herron & Randazzo, 2003; Smithey & Ishiyama, 2002; Weiden, 2010). However, it is likely that the release of the *High Courts Judicial Database* (Haynie, Sheehan, Songer, & Tate, 2007a) will stimulate a great deal of cross-national courts scholarship. This new database consists of numerically coded information for all cases (or a random sample of cases in India and Philippines) reported by the high court in 11 countries: Australia, Canada, India, Namibia, the Philippines, South Africa, Tanzania, the United Kingdom, the United States, Zambia, and Zimbabwe. The period for which the data were collected varies by country, ranging from 9 to 52 years. In other words, each case formally reported by the high court in those nations for the specified period was numerically coded for a number of variables, thus permitting statistical analysis of long-term trends and other phenomena (Haynie, Sheehan, Songer, & Tate, 2007b). One concrete example of this is the emerging research in comparative party capability (Haynie et al., 2001), which was made possible by the development of the *High Courts Judicial Database*.

The ready availability of this data allows researchers to compare various phenomena, such as rates of judicial activism or judicial decision making, in cross-national perspective. The growth of these lines of research may allow for the development of genuine cross-national theories of the judicial process. In other words, it may be possible for scholars to identify certain patterns of judicial behavior that transcend individual court systems. In time, there may be general theories of common law and civil law courts that have been empirically analyzed and confirmed. The role of courts in authoritarian regimes is also an area in which significant progress may be made (see, e.g., Moustafa, 2007).

Another promising direction for future research is the comparative analysis of trial courts and trial systems. As noted above, little research has been conducted by political scientists regarding the differences between the adversarial and inquisitorial trial systems. This fundamental divide has long escaped notice by political scientists, most likely because of the difficulty in obtaining data. Obviously, observing trials outside the United States or other English-speaking nations and collecting data from these tribunals can present considerable language and access difficulties. Nonetheless, experimental research simulating adversarial and inquisitorial trial systems may present one solution to this difficulty (see, generally, Weiden, 2009a).

Similarly, another avenue for future research may involve the analysis of comparative juries: whether certain jury systems are more likely to be more efficient or lead to certain outcomes. This may also be an area in which experimental research may prove to be more practical. Related to this, further research could be conducted to examine the role and influence of lay judges in those inquisitorial trial systems that do not use juries. Overall, the examination of trial courts, trial juries, and lay judges may prove to be an area in which considerable progress may be made.

Finally, the continuation of research regarding judicial independence and separation of powers, using primarily formal models, represents an exceptionally promising area and one that should continue to lead to additional generalized theories of judicial behavior. See generally José Maria Maravall and Adam Przeworski (2003). For example, it may be possible to generate a formal theory of the role of judges in presidential and parliamentary systems and then test those models empirically, using the newly available data in the *High Courts Judicial Database* (Haynie et al., 2007a).

Overall, the diversity of approaches used by comparative courts scholars, combined with the increasing availability of comparative data and the willingness of scholars to look beyond the borders of the United States, ensures that this subfield will continue to yield new insights into comparative judicial behavior and the judicial process.

Conclusion

As discussed, the subfield of comparative judicial politics is both young and old. The comparative study of courts was one of the earliest subjects of political science research before fading into relative obscurity. However, the rediscovery of comparative judicial research in recent decades has produced a body of work containing numerous insights into the role of courts in varying types of political systems. This new research has provided important findings in the areas of judicial decision making, separation of powers and judicial independence, judicial review, and party capability. At the same time, much work is left to be done in, among other areas, comparative trial courts and procedures, juries, judicial independence, and the role of courts in emerging democracies. However, the vitality and rigor demonstrated in the new wave of comparative courts research bodes very well for the future.

CIVIL SOCIETY

RYAN SALZMAN

University of North Texas

The tendency of individuals to group themselves according to race, geographic location, and interest has been seen as natural by both historical theorists and contemporary political scientists. It is not surprising that groups are viewed in this way by individuals who think about or study politics. Politics often requires a basic recognition of the necessity of groups for political organization either as a single group of citizens, as factions of competing interests, or as separate races that share a common leader. Therefore, it appears nearly impossible to consider politics without considering the effects of groups on the system as a whole.

The interaction of groups and political actors in society is best conceived through the discussion of civil society, social networks, and social capital. In this chapter, each of these terms describes an aspect of a single idea that associations shape social and political life. *Social networks* are often informal organizations of individuals that span diverse segments of society (Gibson, 2001). These networks can be small or large, but their ultimate purpose becomes promoting the common interest of the network. Within these networks, social capital can be accumulated. *Social capital* is “the aggregate of the actual or potential resources which are linked to possession of a durable network of more or less institutionalized relationships of mutual acquaintance or recognition” (Bourdieu, 1985, p. 248). The accumulation of social capital encourages individuals to act together to achieve common goals.

Without social capital, the achievement of those goals would be impossible. The ebb and flow of social capital accumulation, especially within the context of social networks, creates social associations that interact at various levels of society and government with varying degrees of formality. This broad condition has come to be understood as *civil society*. Social networks interact with other social networks within the purview of civil society. The actions of individuals within civil society promote increases and decreases in social capital that affect future interactions of individuals and social networks. While these terms are separate in what they specifically represent, the central theme remains consistent that relationships matter.

Although historically inseparable from politics in general, the formal discussion and exploration of groups in society have developed with the spread of democracy since the early 19th century. With democracy came the need to consider the preferences of individuals. Often, these preferences were recognized and shared by individuals, who thus organized themselves into groups based on those shared preferences. The desire of political leaders to know and respond to these groups has promoted the study of associations in society.

This chapter looks at the theoretical and empirical pursuits of research involving the study of social capital, social networks, and civil society. Before delving into the contemporary ideas that are the primary subject of this chapter, it is important to discuss the role of associations

and groups in political life as it has been seen historically. Next, the theoretical concepts of social capital, social networks, and civil society are laid out separately, with attention given to how the terms are interrelated. Then, the relationship of the concepts to the study of democracy is examined as the primary line of research involving social capital, social networks, and civil society. The next section focuses on social capital and civil society as they relate to the economy and the broader society. Then criticisms and avenues for future research are discussed.

The Importance of Associations in Political Life

From the advent of political society discussed by the ancient Greek philosophers to the earliest observations of American democracy and through the global adoption of democracy in the mid-20th century, the recognition of the centrality of humans associating with each other has been revealed and accepted in the context of participatory politics. For Aristotle (circa 335 BCE), in order for individuals to make the correct decision in choosing leaders, citizens had to know about each other. Lacking this knowledge, it was impossible to make proper political decisions for the community. In this way, Aristotle viewed the city as a group in which individuals interacted to gain knowledge of each other's character and preferences. This interaction was necessary when politics required the participation of citizens.

In his observations of early American democracy, Alexis de Tocqueville (1840) wrote at length on the prevalence and necessity of associations in the young country. He viewed these associations as important to the type of participatory society that had blossomed. In America, associations were engaged more successfully than in any other place in the world at that time. By being involved in associations, American citizens were able to overcome their lack of influence as separate individuals. Tocqueville observed that when individuals with a common opinion met, they naturally combined themselves into an association. As the association grew, political actors were forced to take notice of the association and recognize the preferences of the group members. In this way, associations empowered individuals in the political context, which forced accommodation by political actors. It is these associations that maintain the core of the civil society, social networks, and social capital discussion.

Following the observations of Tocqueville, Émile Durkheim (1893/1984) explored the interactions of individuals within society and observed that connections between individuals remain after the initial interaction. These remaining social ties contribute to the functioning of the community in a manner that is broader than the initial interaction by shaping the condition of social capital that results from the interaction. In this way, associations

persistently affect one another through the lasting impact that individuals make on each other.

Many early political scientists promoted the importance of voluntary associations. For example, Almond and Verba (1963) promoted voluntary associations as the most important mediating factor between individuals and the state. Associating with other individuals in a voluntary association gives a person increased political resources that can be used to achieve his or her desired political ends. Also, membership in associations affects an individual's political attitudes. For Almond and Verba, voluntary associations were as important as they were variable. It is this accepted variation between groups that shaped the inquiries related to civil society, social networks, and social capital in the decades that followed Almond and Verba's research.

A Theory of Social Capital, Social Networks, and Civil Society

Social capital, social networks, and civil society are terms and ideas that are related but not necessarily synonymous. Social capital can be the measure by which social networks and civil society are evaluated, but ultimately, it describes relations between individuals or entities. Civil society is an aggregate perspective of relative social capital per sector, society, or state. Social networks are the building blocks of civil society but are generally considered both autonomous from each other and yet integrated into a common civil society. To understand them all, we must understand each.

Social Capital

While decades of work focused on the role of associations in daily life, the concept of social capital did not become cemented in its contemporary form until Coleman (1988) examined different forms of capital and pronounced that, like other forms of capital, social capital existed and facilitated interactions between individuals or organizations. In comparison with physical and human capital, social capital was seen as the least tangible. Instead of focusing on production or relative skill sets, social capital focuses on the functions of certain aspects of the social structure. "The function identified by the concept of 'social capital' is the value of these aspects of social structure to actors as resources that they can use to achieve their interests" (Coleman, 1988, p. S101). Identifying the functions of the social structure became one way to account for the differences of outcomes for individuals, without having to elaborate on the social structure details through which the transitions occur.

To briefly summarize an example provided by Coleman, clandestine organizations can help promote revolutionary activities where otherwise peaceful protests are the expected outcome. In this scenario, the organization of individuals is the social capital that causes the change to revolutionary output. The system remains unchanged. Instead, it is the

introduction of a form of social capital different from what had already existed that prompts the new output. A stable system can produce highly varied outcomes, depending on the social capital that is invested, along with the systematic resources. Coleman's basic assertion is that producing and integrating social capital to produce certain outcomes is no different from combining a raw material (e.g., petroleum) with various physical capital (e.g., technologies) to produce different products (e.g., motor oil vs. gasoline).

For Coleman, the reality of social capital in social structures is dictated by obligations, expectations, and trustworthiness. Ultimately, this dynamic can be easily defined as a system of general reciprocity in which doing something for an individual will prompt a comparable response by the receiving individual. In this situation, trust in the individual who is being helped creates an expectation in that individual to reciprocate. For the individual being helped, an obligation to return the favor is felt and carried through. It is in this manner that social capital is created and developed. An individual can have a store of social capital that he or she can redeem to shape the outcome of a situation. Trust is the crux of the social capital dynamic. Without trust, social capital is virtually impossible to produce.

For Uslaner (2002), trust is a central consideration in many aspects of human activity. While he accepts that trust is not the only way to achieve cooperation, he embraces the idea that a system of reciprocity is more reliable with higher levels of trust. For social capital to operate in the manner perceived by Coleman, generalized reciprocity must be anticipated. Therefore, trust must be achieved, but it must also be assumed. For other researchers, changes in the dynamic of trust reshape the reality of social capital and thus shape civil society in general.

In an attempt to clarify the role of social capital in affecting governance and the reverse of government affecting social capital, Putnam and Goss (2003) differentiated social capital so that the variation between systems could be more easily judged. Some social capital is formal whereas other social capital is informal. The type of organizational structure (e.g., union vs. supper club) dictates whether social capital is formal or not. Another distinction is between thick and thin social capital. *Thick* social capital exists in tightly connected groups, with *thin* social capital being more prevalent among acquaintances. *Inward looking* social capital focuses on the well-being of group members, whereas *outward looking* social capital focuses on public goods. Finally, *bridging* social capital brings dissimilar individuals together, as opposed to *bonding* social capital, which brings similar individuals together. Although Putnam and Goss's distinctions do not greatly add to the theoretical conceptualization laid out by Coleman, they help to clarify the variations in social capital.

Social Networks

In his seminal works examining civil society and social networks, Putnam adopts the idea of social capital discussed

above. For Putnam, like Coleman, social capital centers on trust and generalized reciprocity. In examining civil societies, he also promotes social capital as a public good that is achievable by everyone in a society. In this way, social capital deviates from other forms of capital, including physical and human capital. Social capital and networks of civic engagement create and maintain norms that can act as natural constraints on individuals' or groups' actions through the recognition and embrace of externalities that result from actions that are either positive or negative for the individuals involved. Therefore, social capital can be created, maintained, and redeemed to affect outcomes in an organized system.

The main avenue through which social capital operates is networks of civic engagement, or social networks. In his study of the development of Italy's economic and social institutions, Putnam (1993) considers the form of networks that existed hundreds of years ago and their effect on institutional outcomes in contemporary Italy. Unlike civil society, which is much broader, social networks are particular to the shared interests of the participating individuals. Individuals can be involved in multiple networks that often overlap. These networks are seen by Putnam as instruments for organizing social capital, with many positive outcomes. In fact, Putnam considers these networks of civic engagement to be social capital themselves. In a contemporary sense, these networks could be parent-teacher associations, service fraternities, political parties, tennis clubs, and the like.

The benefits of social networks are often dictated by the density of the networks. *Density* means the quantity and intensity of individuals and interactions in the group. Basically, increased cooperation for mutual benefit is easier in denser networks and more difficult in less dense networks. Putnam (1993) lists a number of other ways that these networks benefit their members. The defection of individuals from the desired outcome of the network is discouraged through increasing the potential cost of defection for the individual. This encourages cooperation. Robust norms of reciprocity are also encouraged by networks of civic engagement. The degree of trustworthiness of individuals is easier to identify because of the increased levels of communication and information flows that are facilitated by the network. Also, the success of networks in achieving collaboration can serve as a template for future collaboration.

Structurally, networks of civic engagement are horizontal in nature. Horizontal networks are not structured hierarchically but are instead dispersed across society in a manner that renders positions in the various networks as roughly equivalent in terms of power. This is not to say that they are always structured in this way, but they are best at achieving the above stated goals when they are horizontal. According to Putnam, only through horizontal networks can social trust and cooperation be achieved. Properly organized social networks can encourage social capital that can improve the efficiency

of society through the encouragement of coordinating actions.

Civil Society

In his writings on the development of Italian society and the changes in the American context, Putnam (1993, 1995, 2000) is most interested in examining the trends of social capital in civil society. For civil society, the focus is on the community in general. Unlike the direct relationships between individuals and entities that are most important for social capital, or the interest-specific networks of civic engagement, civil society is a broad picture of the community. When one is studying civil society, it is important to understand that degrees of connectedness between individuals and entities and within social networks can have society-wide effects that can result from aggregate levels of civic engagement.

Like the positive effects of social networks that were discussed above, the positive externalities of associations and social capital accumulation can affect even those individuals with zero social capital, or those who are involved in no networks. Communities that have generally higher levels of connectedness and social capital stock often find collective action to be easier. This is due to the pervasiveness of the norms that are developed between individuals and within networks. Therefore, trends that affect individuals will subsequently affect entire networks or sectors and ultimately the entire society.

This idea of a broad civil society is addressed in Putnam's 1995 journal article "Bowling Alone: America's Declining Social Capital." In his research, Putnam points to the reality of increased political disengagement as having originated with changes in individual-to-individual interaction, as well as broader changes in the construct of social networks. These changes, he contends, subsequently reshaped the orientation of America's civil society.

Putnam derives his research question (why has civil society changed?) from a seemingly unrelated observation of political participation. He notes that political participation, particularly voting, has steadily declined in the United States. In trying to understand why this has happened, he looks to changes that have occurred in civil society. From this examination, he draws a simple observation on which he rests his argument: U.S. citizens are bowling now more than ever, but participation in bowling leagues is lower now than ever before. Like the examples of social networks, or networks of civic engagement, discussed above, bowling leagues can promote the creation and accumulation of social capital. Putnam moves from this specific observation to a broader set of observations, all reaching the same conclusion that social networks are changing and declining. Reverting back to his understanding of social capital, he contends that a negative shift in "neighborliness" and "social trust" has accompanied the decline in civic engagement. While the direction of the causal arrow is left to future research, Putnam uses this reality to describe the

aggregate-level situation that is present in U.S. civil society. Although he gives a number of potential explanations for this change, what is certain is that it has happened.

As the above discussion of the theories surrounding the concepts of social capital, social networks, and civil society makes clear, each of the concepts is related to the others and yet carries its own distinct characteristics for whom it pertains to and what functions it affects. Social capital is a building block composed of trust and generalized reciprocity through which relationships are established and maintained. Social networks expand the relationships so that they exist between more than just two individuals and are naturally grown by the light of common interests. The extent to which social capital is embraced through social networks shapes the general understanding of a system's civil society. The degree of interconnectedness in a system affects the relative development of that system's civil society, which in turn affects many other aggregate conditions of society at large.

The next section looks at the main line of research in which civil society and social capital are considered: democracy. From this research, tangent lines of research have also developed to consider the impact of social capital, social networks, and civil society. To round out the discussion, criticisms and future research areas are explored.

Civil Society, Social Capital, Social Networks, and Democracy

In participatory political systems (i.e., democracy), the context within which individuals operate dictates their perspective and subsequent action in that system. Just as individuals with larger amounts of wealth are expected to act differently from individuals with meager amounts of wealth, so too are individuals in groups expected to act differently from individuals not in groups. In this intuitive reasoning, it is easy to see that associations bring change to the operations of individuals in politics. This is evident in the debate that surrounded the creation of the U.S. political system, in which the federalists and antifederalists supported competing perspectives on how to create the best government to represent the people.

For James Madison, factions were to be guarded against in the new U.S. democracy. In Federalist No. 10, Madison (1787/1982) made clear that it is natural for individuals to organize themselves into associations with others with whom they share similar interests. Outside of suspending the liberty of citizens, the only way to control the effects of factious associations was by creating a republican form of government. This, he imagined, would ameliorate the effects of the factions without suspending liberty or undermining the participatory political system that the U.S. forefathers intended to create. This early example makes evident the profound nature of associations in democracy. For studies looking at the impact of social capital, social networks, and civil society, their effects on government type, and especially democracy, have been the most

central in this line of research. This section considers some of the research that has been conducted looking at the impact of civil society (and its parts) on democracy.

As discussed above, Putnam (1995) observed the decline in voting in the United States and desired to explain why this had happened. He theorized that declines in participation in associations had caused a decline in social capital, which subsequently led to the decline in voting. For Putnam, the decline in voting ultimately stemmed from the disconnect that had been growing between individuals. Without a need to be connected, there was little need to make group decisions. Although his tests are simple, his conclusions are presented as concrete: Decreases in civil society participation caused the decline in voting.

Writing in 1995, Verba, Schlozman, and Brady considered civic life and its effect on politics in general. They asserted that nonpolitical institutions (including associations and social networks) enhanced citizen activity in politics. This happened for a number of reasons. For instance, participants in civil society were exposed to increased political stimuli that enhanced their willingness and ability to participate in politics. Also, participation in civil society encouraged further participation in civil society so that associational engagement had a multiplicative effect for citizens and society.

Associations also dictate much in democratic societies by setting the political agenda (Cohen & Rogers, 1992). They act as intermediaries between individuals and the state. This action, as an intermediary, can give an association specifically, or civil society broadly, a great deal of power in shaping and coordinating the preferences of participants. Although Cohen and Rogers, like Madison, are concerned with curbing the role of factional associations, they admit that groups and networks can often contribute to democratic governance in a positive manner.

Political participation is particularly important in democratic societies and has thus occupied much of the research on social capital, social networks, civil society, and democracy. In their work looking at participation in the United States, Rosenstone and Hansen (2003) see the voluntary aspect of social involvement as being important in citizen mobilization. First, most groups engage in their own political mobilization. Second, groups expose their members to sympathetic politicians and activists who engage in mobilizing the members. Finally, simply being a member of an organization exposes the members to potential rewards that are jointly sought by other members and can be best achieved through political action. In this way, the degree of social capital, social networks, and civil society can variably affect participation in political life.

For Verba, Nie, and Kim (1978), voluntary associations have an effect on citizen participation that is independent of resources or other factors. These associations can modify the exchange of resources in political activity. Verba et al. anticipated that associations should motivate participation, especially voting, to a greater extent than strictly resources would. However, they also found that resources influence association membership. Presaging this sentiment,

Huntington and Nelson (1976) found that organizational membership is important for political participation. While Verba, Nie, and Kim focus on seven countries that tend to be more developed, Huntington and Nelson are strictly considering countries that are less developed.

Following the lead of Huntington and Nelson (1976), many other researchers have focused on the developing world. This distinction is important because it introduces increased variation in outcomes, which are often more stable across developed countries. The best example of the third world context introducing a new wrinkle to the study of civil society is an article written by Booth and Richard (1998). In their research, they identify a sector of society that they term *uncivil society*. This uncivil society is violent and confrontational and often antidemocratic in its associational condition. Like other variations on civil society, this sector affects governmental action and outputs. Unlike more developed countries, uncivil society is more prevalent in developing regions and specifically Central America.

In countries that have recently transitioned to democracy, social networks have been shown to facilitate that transition. Gibson (2001) explores this concept by looking at post-Communist Russia. Having developed out of the closed Soviet society, social networks with weak ties between individuals occupied the position normally held by formal civil society in helping initiate and develop democracy. Gibson finds that, although informal in nature, social networks provided the political discussion and organization that could evolve into a robust civil society. It becomes easy to see that the social capital–civil society relationship is developmental in nature but can be trusted to emerge from even weak social networks.

Beyond facilitating transitions to democracy, the continuation and consolidation of a democratic system are encouraged by civil society. Although many researchers and theorists have focused on the preeminent role of elites in affecting democratic systems, properly functioning democracies undoubtedly require the input of the people. For this reason, Diamond (1999) sees civil society as irreplaceable for democratic success. In many ways, civil society plays an intermediary role between the private sphere and the state. First, civil society focuses on public ends over private ends. Next, it relates to the state but does not seek to control it. Finally, civil society encompasses pluralism and diversity (Diamond, 1999). Representing the interests of the people, civil society's most important role is its ability to check and limit the power of the state while simultaneously helping to reform it. Therefore, civil society can be roundly viewed as a positive influence on democratic systems.

Other Lines of Research

Besides affecting democratic governance, social capital, social networks, and civil society affect the economic and productive aspects of society. In initially laying out the theoretical underpinnings of social capital, Coleman (1988)

was looking to explain the creation of human capital (e.g., through education). Ultimately, he found that the presence of social capital in the immediate interactions that students had with community members and family, as well as the general social capital present in the community, affected relative drop-out rates among students. Thus, he demonstrated that social capital is an important form of capital, like physical, financial, and human capital, for shaping the economic potential of an individual and the community.

For Putnam's (1993) study of Italy, the development of social capital (and subsequent social networks) was crucial in initiating the economic differences in development for northern and southern Italy. The existence of a vibrant civil society in northern Italy, derived from the mutual assistance established by trade guilds, encouraged an efficient economy that fostered economic development. In the south, vertically organized societies never allowed for cooperation and subsequently stunted economic development. For Putnam, the ideas of reciprocity and trust are a cornerstone for positive development in most aspects of society, including the economy.

These concepts of efficiency in the productive aspects of society are echoed by Dekker and Uslaner (2001) in the sociological discussion of the role of social capital in affecting economic outcomes for communities. For these authors, a number of conditions result from stronger social networks and social capital relations. First, information sharing encourages efficiency by allowing individuals to avoid inefficient means of production. Second, activities are more coordinated in communities with higher social capital. The example that the authors give points to the failures of irrigation systems due to self-interested actions by farmers who diverted water because the opportunity existed. Third, collective decision making encourages a more efficient distribution of public goods. For Dekker and Uslaner, all three of these efficiency-encouraging activities result from higher levels of social capital in a community.

Besides the governmental and economic effects of social capital, social networks, and civil society, a number of strictly communal impacts have been identified. The clearest identification of some of these benefits is made by Putnam and Feldstein (2003). Not only are the benefits of social capital individual specific, but they also extend to the community as a public good. Drawing correlations between the degree of social capital and community conditions, Putnam and Feldstein observe that communities with higher degrees of social capital (conceived of and measured differently) also have lower crime rates, healthier newborns, and lower drop-out rates. These improved conditions illustrate social capital's importance in society beyond the scope of economic efficiency and democratic governance.

Criticisms

Many studies have extended the ideas associated with social capital, social networks, and civil society in ways

that are critical but productive. Most criticisms derive from the idea that these terms are incomplete. Work by Foley and Edwards (1996) is a good example of this extension. Beyond the understanding of civil society that this chapter has discussed (i.e., that civil society promotes further civility in the population that subsequently fosters democratic governance), the researchers embrace the inclusion of an alternative civil society. They conceive traditional civil society, called Civil Society I, and the alternative civil society, called Civil Society II.

Civil Society II is more autonomous from the governmental apparatus and is thus in a better position to oppose it. This argument is especially applicable for tyrannical regimes. In that context, Civil Society II is able to oppose the tyrannical regime and potentially encourage regime change. In a similar manner, Booth and Richard (1998) extend the discussion of civil society to include Civil Society III. This form of civil society is limited to strict efforts of regime replacement. Basically, Civil Society III is revolutionary in nature. While each of these criticisms is more productive than not, it is important to focus on the completeness of the concept in all contexts.

Another prominent criticism of the social capital, social networks, and civil society discussion is that the conclusions surrounding the impact of associations are overstated. Although many researchers contend that social capital directly impacts aspects of individual and societal life, others disagree, saying that it is only a part of the puzzle. For instance, Stolle and Hooghe (2003) question the importance of associational life for individuals. Also, they conclude that the impact of social capital outside of the group setting is weak, if present at all. Although they do not desire to remove associational life from its prominent position of study, they encourage a distinct focus on the internal workings of groups (and the subsequent social capital movement). Also, Stolle and Hooghe push for further study of the external impacts of groups and the role of civil society.

Another criticism that often arises in studies of social capital, social networks, and civil society is that of measurement of the topic in focus. How does someone accurately measure an idea such as social capital? Approaches to measurement abound. Some individuals prefer surveys to identify social capital. Not without problems, surveys can often make cross-country comparisons impossible because of a lack of transferability of ideas. For civil society, many researchers employ the number of groups in a society or the number of groups to which an individual belongs on average. Again, problems of measurement emerge pertaining to what groups to include, how to distinguish between group types, and whether to include a time element in the measure. Social networks also pose difficulties in measurement due to the intrinsically weak nature of the connections between individuals. Although these issues are not insurmountable,

they must be considered in evaluating the conclusions about the concepts that are drawn by researchers.

Future Research

Research on social capital, social networks, and civil society has come a long way since the work of Coleman and Putnam 20 years ago. However, as the concepts have continued to develop, the context of society has continued to change. With this change comes a need to continue developing the concepts and test for changes in their applicability. One example of a new concept that may shed light on the role of social capital in affecting democratic behavior is that of *political capital*. According to Booth and Richard (2009), political capital is the linkage mechanism that connects social capital to political outcomes. Studies like this will help clarify the effect of social capital and civil society on democracies.

One major change that has occurred over the past decade, and that will cause a particular need for further research, is the development of technology, which has reshaped how we perceive groups to be structured. In his study of the United States, Putnam (1995, 2000) points to the technological development of television as a cause of the decline in neighborliness, which directly affected civil society. The advent of what he calls *tertiary associations*, understood as associations that involve mostly mailings and dues payments but few meetings, changed the way people in America viewed groups. In these ways, groups and their impact on politics and society changed over time.

Technological innovations that will again change the impact of groups on politics and society most notably involve the Internet. Although interactions among group members are more direct on the Internet than in the case of tertiary associations, it is uncertain whether social capital developed through the Internet will act similarly to that developed in community associations such as the parent-teacher association at a local school. In many ways, social networking sites are exactly as advertised: social networks. In other ways, these sites appear to encourage individualism before generalized reciprocity. For these reasons, research focusing on the role of social capital, social networks, and civil society must continue.

Without anticipating technological innovations, is there still a place for research as it is being conducted now? The answer is a resounding yes. The more classical perspective on the roles of associations in society still demands a great deal of attention in the developing world. Many countries continue to strive for democratic governance, and many others are pushing for the consolidation of their democratic regimes. In these countries, studies of traditional civil society and social networks still have much fruit to bear. Besides confirming already held perspectives, these studies will allow for new contextual realities to be integrated into past studies, which

will increase the robustness of or inspire revisions to the conclusions reached by researchers. Basically, there is still much to learn about social capital, social networks, and civil society in nondemocracies, new democracies, and consolidating democracies that cannot be learned in already consolidated democracies.

Conclusion

Individuals naturally associate with each other. Beyond simple, inconsequential interactions, people often seek out groups to join based on their preferences. The basis for joining can be religious, ethnic, political, and so forth. Associations can be in the form of environmental groups, bowling leagues, churches, political parties, neighborhood associations, social networking Internet sites, and the like. Groups are as varied as the people who compose their membership. However, even with the degree of variation that exists, there are certain consistent effects for individuals that derive from being a member of a group. These effects are conceived of as social capital. As members of groups, individuals build social capital by contributing to a system of generalized reciprocity in which other individuals, often members of the same group, will then return the effort that the individual contributed. That return may be in a similar context in which it was given. However, that return may also manifest itself in a unique context. Regardless, individuals desire to reciprocate what others have given. In this manner, social capital affects group and individual performance by inspiring trust and a desire to return the favor.

Social networks and civil society are broader concepts that focus more on the types and numbers of groups within a specific system (e.g., a country). Within social networks and civil society, social capital is exchanged and stored so as to affect individuals' attitudes and behavior. Social networks emerge as a less formal organization of individuals with common interests who, when acting together, can have a greater effect on the system. Civil society is the most aggregate concept and describes the number and intensity of social networks and other associations in a system. The strength of civil society is a broad conceptualization of the associational nature of a system that may affect much of the behavior of system-level actors.

The concepts of this chapter are most effective in countries with democratic regimes. In these participatory political systems, associations become another avenue of participation and can inspire or invite mobilization in the political system. Political participation shapes democratic governance, and associations can shape participation. Besides politics, a strong civil society can also affect the economy by encouraging efficiency and affecting general demographic conditions through educational attainment and reducing criminal tendencies of individuals in a community.

The academic endeavors of researchers have spanned the entire globe. While the context of research is highly

variable between developed and developing countries, the general consensus remains that social capital, social networks, and civil society are consistent concepts. The primary variation is the distinction between participatory and nonparticipatory political systems. Basically, systems that encourage individual input (i.e., democracy) cannot avoid influence by associations. That influence can be intense and broad, just as it can be subtle and specific. Only with continued research will those distinctions become obvious.

POLITICAL CULTURE

MARC HOOGHE

University of Leuven

The concept of political culture refers to the political attitudes and behavioral patterns of the population, and it is assumed that this culture largely determines the relation of citizens with the political system. Most studies on political culture claim that specific elements of that culture have an impact on the way political institutions function, although it has to be noted that the reverse causal logic (institutions determining the political culture) has been argued as well by authors adhering to an institutionalist perspective on politics. Political culture includes both the individual's view of himself or herself as a competent political actor and the perception about his or her role within the political system. Strictly speaking, *political culture* refers only to the attitudes of citizens, but in practice it also includes behavioral patterns that are closely related to these attitudes. This chapter first reviews the development of studies on political culture, paying specific attention to the work of Gabriel Almond, Sidney Verba, and Robert Putnam. Subsequently it reviews the empirical research on specific elements of political culture before closing with a glance at future directions in this subfield of political science.

Studies on Political Culture

The Civic Culture

Very few subfields in political science have been determined so strongly by just one book as has the study of political

culture. That book is *The Civic Culture* (TCC), by Almond and Verba, which first appeared in 1963. In this book, the authors argue that a specific orientation toward politics is crucial for maintaining the institutional status quo of democratic political systems. In this regard, Almond and Verba argue for a strong culturalist approach to the study of democratic stability. It is assumed in their work that the presence of a political culture is responsible for the effectiveness and stability of a political system. As such, they oppose various forms of institutionalism, arguing that democratic stability is enhanced first of all by the presence of strong and effective institutions and constitutional rules.

Almond and Verba distinguish three different phases in the development of political cultures. A first, more traditional form most often found in closed traditional societies is the *parochial political culture*. This kind of political culture is very strongly locally based and is focused on adherence and deference to a charismatic leader. This leader combines various social roles in that he or she does not exercise just political power; military, religious, and sometimes even medical powers are also attributed to him or her. Second, Almond and Verba list the *subject political culture*. In this form of political culture, roles are already more strongly differentiated, and this culture is compatible with the functioning of nation-states, covering a larger territory than the purely parochial communities. In this kind of system, citizens already have acquired a very distinct role, that of subject, with the duty to obey the commands of the head

of state. This implies that this form of political culture is very closely linked to the development of *absolute monarchy* during the 16th and 17th centuries in western Europe. The monarch holds absolute power and has no need to legitimize that power in public opinion, often claiming historical or even religious sources of legitimacy.

Almond and Verba note that the subject political culture has become unsustainable in the developed democracies of the 20th century. As both the education level and the economic status of Western populations have increased, it has become increasingly difficult to limit the role of citizens to merely obeying the sovereign's orders. A typical modern form of political culture therefore is the *participant political culture*. In this form, citizens assume that they are able to express themselves on political matters, and they also take it for granted that they have the right to participate in processes of political decision making. During the 20th century, the participant political culture grew in power, and it has become almost impossible for the political elite to ignore the demand for more participatory openness.

However, Almond and Verba do not see the participant political culture as the type of culture that is most easily combined with the stability of democratic regimes. Although they acknowledge the fact that political systems should allow for routine participation of citizens, they also express concern about a possible "overload" of the political system. If a large number of citizens want to participate in a routine manner, and if they do not feel inclined to accept the output of the political system in case their demands have not been met, this would mean that the political system in effect can no longer govern. Almond and Verba, therefore, express some concern that citizens should not participate constantly or too intensively. Rather, they are potential participants, who do not interfere constantly but always feel sufficiently efficacious to interfere if the need should arise. Furthermore, they are willing to accept the decisions of the political system, as long as these are the result of the democratic process.

The ideal *civic culture*, therefore, according to Almond and Verba, is a mixture of the three preceding forms. Citizens feel sufficiently empowered to participate in the decision-making process, but they are also loyal to the political system, and they are willing to adhere to the decisions that have been made by that system.

The Almond and Verba study has been hugely successful, and it has continued to dominate the field of political culture studies for decades. There are a number of reasons TCC had such a strong and lasting impact.

First of all, it was one of the first successful applications of comparative survey research. The book included survey material from five different countries, which was very innovative in the early 1960s. As such, Almond and Verba could make more convincing claims about causality and relationships between variables than could earlier studies that focused on just one country. Second, and partly related to this, is that Almond and Verba were the first to be able to

strongly defend the importance of public opinion. Claims about the effect of public opinion self-evidently require access to survey data, and since these data were hardly available before the 1950s, Almond and Verba could make a much more powerful claim than previous authors had done. One might even say that, by themselves, they reinvigorated the culturalist claim in the study of politics. Third, in the early 1960s, there was indeed quite some concern, both in academia and in society, about the stability of democratic political regimes. Quite a few Western countries felt threatened by the rise of Communist rule in Russia and in Central and Eastern Europe. The ongoing process of decolonization, furthermore, led to the question of how one could ensure democratic rule in the newly independent countries of Africa and Asia. TCC provided an instant answer to all these questions: One should try to install a civic culture among the populations of these countries.

In general, it can be observed that TCC endorsed a very moderate view of political culture that resonated apparently quite successfully with the dominant view in the early 1960s. On one hand, Almond and Verba strongly supported the normative ideal of an active citizenry, but they simultaneously stressed the need for citizens' loyalty to the political system. This latter point especially was increasingly criticized during the 1970s, a period when support for an activist role of citizens became increasingly popular. In that period, TCC was also criticized for what was labeled its focus on Anglo-Saxon political cultures (Inglehart, 1988). The emphasis on citizens' loyalty implies a preference for stability and incremental changes in the political system. Revolutionary or disruptive forms of political participation are not really evaluated in a positive manner in the Almond and Verba framework.

Social Capital and Political Culture

Research on the development of political cultures in modern democracies was strongly reinvigorated by the publication of the 1993 volume by Putnam on civic traditions in modern Italy. To some extent, one could argue that Putnam (1993) essentially took a new look at the question Almond and Verba had posed three decades earlier: What makes democracy work? The innovative feature of Putnam's research was that he could start from a quasi-experimental research setting. In 1970, 20 regional governments in Italy received a large degree of autonomy. Two decades later, it could be observed that whereas some of these regional governments were highly effective and responsive to their population, other governments seemed caught in a downward spiral of corruption, lack of initiative, and poor quality of delivered services. Putnam set out to explain why some regional governments had a stronger performance record than others did. Exactly because the Italian regions had no autonomy before 1970, the Putnam study is better able to establish causal links than the Almond and Verba study because in Italy, prior differences in policy could not be responsible for the observed differences.

Based on extensive data sources and analyses, the main conclusion of Putnam's study is that the presence of a civic political culture is the main determinant of government performance. In regions with a vibrant civic culture, regional governments are more likely to respond in an effective manner to citizens' demands. Putnam identified a number of elements of this political culture. First of all, he considered the presence of *voluntary associations* to be not only a structural component of social capital. According to Putnam these associations not only dispose members to be socialized into a more socially oriented value pattern but also allow citizens to establish collective goals in a more effective manner. Following political news in the mass media is also considered an important indicator of a civic culture: If citizens read newspapers, they are likely to acquire political information, and they have the means to hold politicians accountable for policy decisions and outcomes.

Putnam's research shows that in Italian regions where these elements of a civic culture are present, regional governments perform much better than elsewhere. The study remains rather vague, however, about the precise causal mechanisms involved. On one hand, it can be expected that because of the active interaction among citizens, democratic political attitudes are being interiorized, and the population as a whole becomes more closely involved in the way society functions. On the other hand, however, it can also be expected that political elites simply experience more pressure from public opinion, forcing them to react in a more responsive manner to demands from the population.

Putnam assumes that the origins of the present-day political culture in the various regions of Italy have to be traced back several centuries. Already in the 14th century, the city-states in the northern part of Italy had established basic forms of self-rule, giving political power to some of the most privileged groups of society. The argument is that this practice had already instilled some form of democratic awareness, so citizens had the feeling that they themselves were responsible for the way their political system was being run. Southern Italy, on the other hand, during that period was still being run by autocratic monarchs, which instilled a form of subject political culture. Even six centuries later, it is argued, this division is still present in contemporary Italian society.

Empirical Research

Numerous empirical studies are available on the development and the consequences of political culture. Most often, these studies tend to focus on one specific aspect of political culture: political efficacy, political trust, political interest and knowledge, and political participation.

Political Efficacy

Political efficacy is the expression of a feeling of empowerment with regard to the political system. It is an

important attitudinal component of political culture because efficacy can be considered a prerequisite for any form of political participation to occur (Finkel, 1985). Efficacy can mainly be understood as a form of political empowerment: Citizens have the feeling that their opinion matters, that they are qualified to have an opinion on politics, and that if they make an effort to get their voice heard, they will have an impact on the decision-making process. Furthermore, political efficacy can be seen as a self-reinforcing attitude: Simply taking part in participation acts has a positive effect on the development of efficacy.

Measurement of political efficacy tends to make a distinction between internal political efficacy and external political efficacy. *Internal political efficacy* refers to an internal locus of control, that is, the feeling that the individual has sufficient (cognitive) skills and resources to arrive at a full understanding of what goes on in the political system. *External political efficacy*, however, is just as crucial. This dimension refers to the expectation that political decision makers will act in a responsive manner to the way citizens express their demands. The two dimensions of political efficacy do not necessarily go hand in hand: It is possible for a citizen to have the firm conviction that he or she is quite capable of expressing well-informed political opinions but to believe simultaneously that authoritarian rulers will not pay any attention to what citizens say. However, survey research often shows that in practice, internal and external political efficacy are closely related.

Political Trust

Political trust (sometimes also called *institutional trust*) refers to the feeling that citizens have of the trustworthiness of political institutions. As such, it can be seen as a form of diffuse support a system receives from citizens. It is important in this regard to make a distinction between different levels of the object of political trust. First, political trust can refer to the conduct of specific politicians, most notably those holding power. Unsurprisingly, this kind of specific trust is most volatile, and it is related to the performance of the politicians in power, of the political system in general, and of the economy of the country. Fluctuations in the level of trust toward specific politicians, however, are usually not seen as problematic, as incumbent politicians can be replaced.

A second level refers to trust in the institutions themselves, such as parliament, government, or the courts. Here the assumption is that trust in these institutions is vital for the stability of the system. Even if citizens do not agree with the policies that are being conducted by the governing party or parties, they may yet express trust in the institutions of government. Survey research indicates that trust in institutions is much more stable than trust in specific politicians. Third, and much more abstract, is trust in general principles governing political life, such as trust in democracy. In most Western societies, this trust level remains very elevated and stable.

In survey research, political trust is usually measured by asking respondents to indicate which, from a list of specific political institutions, they trust. In most of the available surveys, political trust can be considered to be one-dimensional, indicating that the scores on the different institutions will be related. In other words, respondents who have trust in parliament are also likely to express trust in, for example, the police force. Some other studies, however, reveal a dual structure, with a distinction between representative institutions (e.g., Parliament, government) on one hand and nonelected, law-and-order institutions (e.g., courts and police) on the other.

The recent literature contains quite a bit of discussion of whether political trust really should be seen as a valuable—or even indispensable—aspect of a democratic political culture. It has also been argued that in democratic regimes, citizens should adopt a critical attitude toward political decision makers, and that they should not put blind trust in the political elite (Norris, 1999). Some authors have even argued that it should be assumed that citizens will be distrustful toward the political elite, because there is no reason to expect that politicians will be motivated first of all by the interests of the people.

Research shows, however, that the presence of political trust has considerable consequences for the effectiveness of the political system. Scholars have noted a strong distinction between countries with high levels of political trust (most notably the Scandinavian countries) and the former authoritarian regimes in Eastern Europe (Newton, 2007). High levels of political trust are associated with greater willingness of citizens to obey the law, with a higher level of legitimacy for state intervention, and with a reduced need for government control on, for example, tax legislation (Tyler, 2006). Here too, however, the direction of causality is uncertain. One can indeed observe a close relationship between levels of corruption in a country and the level of political trust among its citizenry. Studies on Central and Eastern Europe, however, have established the reverse causal relationship: Endemic corruption in a country has a negative impact on the development of political and institutional trust in the population (Mishler & Rose, 2001).

The United States offers a specific case in the study of political trust. Although in the 1950s, the United States clearly belonged to a group of countries with very high levels of political trust, the level of trust has continuously declined since the late 1960s. In the early 1970s, the Watergate affair led to a spectacular drop in trust levels, and the level of trust has never been restored to historical levels (Hetherington, 2005). It is difficult to determine the exact cause of this structural decline, but a number of arguments have been put forward. First, increasing ideological polarization between the political parties has rendered it more difficult to respect the opinions and the political functioning of opponents. Second, the way in which the mass media cover political affairs has become increasingly aggressive and cynical. During election campaigns, for

example, the media place much more emphasis on strategic considerations and the “horse race” coverage of campaign dynamics than on the ideological and political differences between the candidates. Various scandals and affairs also receive considerable attention in the media, leading to the perception that corruption might be widespread in Washington, DC. The decline in levels of political trust also has political consequences. Hetherington (2005) argues that U.S. citizens are reluctant to accept government intervention in various fields (e.g., health care or education) exactly because they do not have the feeling that state institutions are able to deliver those services in a reliable or cost-effective manner.

Political Interest and Knowledge

The civic culture also requires that citizens be actively interested in political developments and that they expend time and effort to keep abreast of political developments. Cognitive involvement is thus an essential component of the civic culture. There is more discussion in the literature, however, on how exactly this form of involvement should be conceptualized and hence operationalized. Early research from the 1950s argued that citizens should acquire knowledge about the functioning of the political system, and therefore the state of political knowledge among the population could be used as an indicator of the presence of a sound political culture. Routinely, however, political knowledge levels in the population were shown to be very low, with most citizens apparently unaware of even the basic facts with regard to the functioning of the political system, and this result was of course a reason for concern among numerous political science scholars. During the 1970s and 1980s, however, this view was increasingly abandoned, as it was shown that political knowledge levels were mainly determined by education levels. Some deduced from this finding that those with lower education levels somehow could be blamed for not contributing sufficiently to the level of political knowledge (and hence of civic culture).

However, a number of studies by Michael Delli Carpini and Scott Keeter (1997) put political knowledge on the research agenda of political scientists. Carpini and Keeter’s study demonstrated that cognitive mobilization has strong consequences for various forms of political engagement. Those high on political knowledge are not only more tolerant, even toward citizens with other political preferences, but are also better able to identify their own political preferences and the way they match with the positions taken by political parties and politicians. To put it more simply, political knowledge allows citizens to participate in politics in an effective manner. Contemporary concern was further fueled by the finding that mass media play an increasingly divisive role with regard to political knowledge. Although entertainment media have a negative correlation to political knowledge, highbrow news media add to the development of political knowledge (Prior, 2005).

This impact, of course, means that the knowledge gap between the haves (i.e., those with a high education level and a preference for news media) and the have-nots (those with low education levels and heavy use of entertainment media) will only continue to expand.

This trend does not mean, however, that political knowledge has become a generally accepted indicator of the presence of a civic culture. First of all, although it is possible to measure political knowledge in a more or less valid manner within one country, comparative tests of political knowledge (to be applied in a number of countries simultaneously) are almost totally absent from research. Even within a country, various questions have been raised about the validity of political knowledge tests. It has been shown, for example, that male respondents perform better on questions about leading male politicians, whereas female respondents respond better on questions about leading female politicians, serving as role models for female respondents, who apparently are able to identify more easily with female politicians (Mondak & Anderson, 2004).

A more indirect manner of testing cognitive involvement in the political process is to question the level of political interest of respondents. In this kind of research, respondents are simply asked whether they are interested in politics. How exactly they practice or express this political interest is not asked. This kind of survey question seems to work very well: Political interest is not only a stable attitude but also has a strong predictive effect on reading newspapers, on following political news on television, and on the level of political knowledge.

Political Participation

Citizens are also expected to participate in political life in order to convey information about their demands and preferences to political decision makers. Although various definitions of the concept of political participation can be found in the literature, they all have two elements in common. First, political participation is a form of action to express a demand. Whether citizens go out to vote, take part in a demonstration, or write an e-mail to a member of parliament, it is clear that they have a specific preference or demand and are asking the political system to respond in some way or another. Second, they are able to put some pressure on the decision makers to pay attention to their demand. This is most clear in elections, as it can be assumed that politicians who do not pay sufficient attention to the preferences of the population will not be returned to office. Demonstrations can also be used to disrupt the normal functioning of society or to endanger the legitimacy of government. Although the element of pressure might be weaker in an act such as writing to a member of Congress, the implicit threat is still that not responding to the demand will lead to fewer votes at the next election (Rosenstone & Hansen, 1993).

Political participation is determined, to a large extent, by the presence of resources (Verba, Scholzman, & Brady,

1995). The *civic voluntarism model* argues that citizens will participate only if they have time, money, cognitive skills, and other resources available. Some persons are also more likely to be targeted by mobilization efforts than are others. The model also includes *civic skills*, such as the ability to address a meeting, to voice a concern in a coherent manner, or to discuss politics with others. This model implies that strong differences in level of political participation occur. Specifically, citizens with higher levels of education will participate more often, more intensively, and more effectively than those with lower levels of education. Verba in particular claims that this form of inequality can lead to strong distortions in the political process: Those with abundant political resources will enjoy more opportunities to get their voices heard in the political process than those who have less access to these resources (Verba, Nie, & Kim, 1978).

In practice, citizens have access to a whole array of possible participation acts, ranging from voting to party activism to illegal protest. In the research on political participation, the repertoire of acts that are considered legitimate participation acts has gradually widened. In the 1950s, the emphasis was still strongly on voting in elections, taking part in electoral campaigns, or activities within political parties. In their hallmark study on *Political Action*, Barnes, Kaase, and Allerbeck (1979), however, argued that one should distinguish two totally different kinds of political participation. On one hand, conventional political participation refers to activities taking place within the context of mainstream political institutions such as political parties. But in addition, citizens have access to various other forms of participation that are much more elite-challenging. Examples would be signing petitions and taking part in demonstrations or even illegal protests. Barnes et al. show clearly that taking part in these unconventional forms of political participation is not an indication of total alienation from the political system. On the contrary, citizens who take part in one form of participation are also more likely to take part in other forms. Party members might, if the need arises, take part in demonstrations, for instance. Barnes et al. conclude that both conventional and unconventional participation acts have their place in a democratic political system and that citizens apparently select the participation act that they consider to be most effective in specific circumstances.

Although the 1979 Barnes et al. volume has been immensely successful, in the current literature it is also considered outdated to some extent. First of all, the distinction between conventional and unconventional participation has become blurred. Elite political actors increasingly rely on unconventional means to get their voices heard. Second, various new forms of political activism are gradually becoming more important in the early years of the 21st century. Internet activism is one obvious example. The Internet is increasingly being used as a medium to express political opinions (Krueger, 2002). Another addition to the political action repertoire is the rise of political

consumerism, or consumers' use of all kinds of boycott campaigns to get their message across, not just to national governments, but to international organizations or international corporations (Stolle, Hooghe, & Micheletti, 2005). It is unclear whether these "new" forms of political participation should be labeled conventional or unconventional participation.

Developments in Contemporary Political Culture

As mentioned earlier, the civic culture approach to the study of political culture met with increasing criticism from the 1970s on. Various authors questioned Almond and Verba's focus on loyalty and deference to authority in their notion of a civic culture. Increasingly, authors argued that citizens should become more active, and should enjoy a larger freedom to express their political opinions. Ronald Inglehart is one of the most prominent figures in this line of research. From the early 1970s, he argued that a gradual *cultural shift* is taking place in Western societies. Increasingly, citizens develop a *postmaterialist*, or *post modern*, value pattern. As material needs can now be taken for granted for a vast majority of the population, citizens increasingly develop postmaterial value preferences, paying more attention to quality-of-life issues, equality, and protection of the environment. One of the defining characteristics of this value pattern is a more positive appreciation of individuality and the need for self-expression. Citizens with this value pattern are less likely to respect authorities, and they demand more strongly that their individual opinions and patterns be paid attention to in the decision-making process. Whereas Almond and Verba feared that this increasing use of political participation might lead to an overload of the political system, Inglehart (1997) assumed that political systems simply have to find ways to deal with the increasing volume of demands from their citizens. The presence of critical citizens, therefore, does not pose a problem for the stability of democratic society. Inglehart produces empirical evidence that in the most stable democratic systems of the world (e.g., the Scandinavian countries or Canada), postmodern values are the most widespread across the population.

Other authors, too, have put forward the claim that cultural changes in Western societies have led to a different political culture from the one that prevailed when Almond and Verba conducted their study. Group identities have become less salient as processes of individualization have led to a more individualized outlook toward the political system. Class and religious cleavages, therefore, are less able to predict political preferences and political behavior. The feeling of loyalty toward political leaders has been eroded, and citizens now tend to develop a more critical attitude toward the political system. Furthermore, there is a strong demand for more effective ways of participating in political decision making. All these developments

impose a strain on the functioning of political systems, which are forced to invent new ways to meet these social demands. It would be wrong, however, to consider these developments as a crisis for democracy. Survey research shows that citizens support democratic government more strongly than ever before. At the same time, however, they are increasingly critical for the political institutions that have to embody this form of government (Dalton, 2004).

Future Directions

The study of political culture remains as vibrant as ever in political science, although it has to be mentioned that little progress is being made in the perennial debate between cultural and institutional perspectives on the development of political culture. For empirical scholars, it is indeed very difficult to come up with a convincing and feasible research design that would settle this debate conclusively. Nevertheless, the distinction between cultural and institutional explanations is crucial for two hotly debated topics: Can a democratic political culture be established, and can the institutions of democratic political systems adapt to the rise of a new generation of "critical citizens"?

One of the main problems in the study of political culture remains to define how exactly a democratic political culture can be installed. Especially in the former authoritarian regimes of Central and Eastern Europe, the lack of support for democratic principles of government remains highly problematic. Even 20 years after the fall of the authoritarian regimes, it can be observed that levels of political trust, political interest, and political efficacy remain remarkably low. Although in some countries, an upward trend for these indicators can be observed, in other countries the levels remain very low. An institutional approach would argue that trust levels will rise only if the political institutions themselves will start to function in a more effective manner, by reducing the current high levels of corruption. In this regard, too, however, there is little reason for strong optimism: It cannot be expected that a fight against corruption will lead to a quick or immediate rise in political trust levels. Cultural approaches argue that the relation should be seen the other way around: Only if the political culture of the population changes in a profound manner will it become less likely that civil servants or politicians will resort to corruption. The basic question in this regard is how stable political cultures are. In his famous book *The Clash of Civilizations*, Samuel Huntington (1996) argues that political cultures are inherently stable and that they do not change much over time. The interaction between cultures, therefore, would easily lead to enduring conflicts. Empirical research, however, shows quite convincingly that cultures can and will change over time. One example may be instructive: In the early 1950s, there was considerable concern over whether the political culture in Germany was conducive to stable democracy. Little more than a decade later, however, survey research showed that the German population in a very

stable manner supported democratic orientations and values, and Germany is now considered to be one of the most stable democracies in the world. Why exactly this transition occurred, and how this experience might be transferred to other social contexts, however, remains a question that needs to be explored further.

Another important debate concerns the impact of the rise of a new generation of critical citizens. That citizens in Western democracies have become more critical has been well established. Given the fact that this attitude is concentrated among younger and more highly educated cohorts, it can also be reasonably expected that this trend will continue to grow in importance in the decades ahead. What we do not know yet, however, is what the impact of this trend will be for the functioning of political systems. Is this just another challenge that democracy can easily overcome (Dalton, 2004)? In the framework of David Easton (1965), it is assumed that political systems are dependent for their stability and legitimacy on the diffuse support they receive from the population. We do not know what will happen if this form of loyalty becomes weaker. To put it differently, is it possible that citizens become too critical? Electoral research shows that a lack of political trust can lead to a vote for extremist or populist parties, and this too might form a threat for the stability of democratic political systems.

The rise of the generation of “critical citizens” poses a much more fundamental question for political science, and more broadly for the social sciences. On one hand, we know that almost all indicators of a democratic political culture are closely related to the education level of respondents. Those who have high educational levels are usually more trusting, and they also have a stronger feeling of political efficacy. Simultaneously, we know that the average education level of citizens in Western countries has risen strongly since the mid-20th century. So the assumption could be, for example, that feelings of efficacy would have risen in the same manner during this period. However, it is clear that this has not happened. Although access to higher education has been generalized in most Western democracies, the expected results of this evolution sometimes fail to materialize.

Conclusion

Within democratic political systems, citizens’ attitudes toward the political system clearly matter. Traditionally, it was expected that citizens trust the political institutions but that they also feel sufficiently efficacious to play a part in political life and to get their voice heard. While there is a general consensus on the importance of a democratic political culture, there is an ongoing discussion about the direction of causality: Does a democratic political culture lead to democratic stability, or do effective institutions lead to the development of a democratic political culture? This problem largely remains unsolved.

Empirical research, however, shows that political trust levels tend to decline, especially in the United States. How exactly political institutions retain their legitimacy and effectiveness in these circumstances remains to be investigated. A compelling issue, furthermore, is how a democratic political culture can be built in newly democratic systems.

RELIGION AND COMPARATIVE POLITICS

BRYAN A. S. RASMUSSEN

Collin College

The past two decades have seen a resurgence in the study of how religion affects politics in the United States and around the world. For generations, social scientists believed religion to be declining in influence to the point that it might eventually be marginalized. However, political scientists continue to observe, among other things, the importance of Christianity in the United States and the increasing influence of extremist Islam leading to events such as September 11, 2001. As political scientists have asked questions about these developments, the body of literature on the subject has grown to the point that the American Political Science Association recently initiated a journal titled *Politics and Religion* in order to give proper attention to this important area of research.

This chapter will review contributions scholars have made to the understanding of religion and politics from a comparative perspective. Although the United States is one case that is worth examining because it is unique, the chapter will touch on it only briefly. There is another chapter in this volume that deals specifically with the relationship of religion and politics in the United States. Analyzing religion and politics from a comparative perspective makes the analysis a great deal more complex. There are a wide variety of government institutions and cultures around the world, as well as a variety of religions represented. In addition, there is considerable distinctiveness within many of

those faiths as to how the sacred texts are interpreted or how “faith” is to be practiced.

There is also considerable variation in the methods comparative political scientists use to do their research. The days of comparativists doing exclusively qualitative area studies are gone. While some of that valuable research remains, comparativists now have the data and computing capacity to strive for more quantitatively supported grand theories. The problem that has been seen in the past, as this chapter shows, is that the oversimplification that is required to make a grand theory can many times render the theory weak or simply wrong. In the end, the prevailing wisdom among comparativists calls for building theory from the bottom up (Geddes, 2003). This means researchers start with a country or a region, establish a relationship there, and then try to generalize as they can from there. This means that the variations in institutions, cultures, and religions previously mentioned cannot be ignored, making religion and comparative politics a very complex subject.

As such, this chapter does not cover the whole topic. Instead, it starts by examining the fundamental role of religion in society and how that role has evolved over the years. It then reviews some of the primary approaches scholars have taken to understanding the relationship between religion and politics around the world. Finally, it looks specifically at some of the most important areas of study in the field in recent decades.

The Evolution of Religion Theory

To understand the current state of the literature in the field of religion and comparative politics, it is helpful to begin with the influence religion can have on individuals. It goes without saying that religion has always been important to people and has the capacity to influence how they live their lives. For many, religion is a cornerstone of who they are and plays a big part in many of the decisions they make. As will be discussed, there is evidence that religion has been losing influence over the past 400 years and that this pattern continues today, although the extent to which this fact is true is up for debate. In any case, religion has always had, and continues to have, a very personal connection to many people and can therefore be used in many ways as a powerful motivator.

From where does this deep personal connection come? Social scientists have been debating many possible answers to this question for centuries. In *Eight Theories of Religion*, Daniel Pals (2006) identifies primary modern theories and traces them back to their origins in an effort to understand how this connection between people and religion is formed and why it is so important. Before a few of the social scientists that Pals credited with defining these theories are highlighted, two points need to be made. First, it is interesting to note that most of these early social scientists took general theories that they had been working on and applied them to religion. They had a lens through which they saw the world, and they then looked at religion through that lens, giving us a different perspective.

Second, most of these social scientists were not religious people. A certain religion (i.e., Christianity) was not the lens through which they saw the world. It was scientific theory that provided their perspective. One of the assumptions sometimes made in discussions about the nature of religion is that devoutly religious people cannot effectively contribute to an intellectual discussion about religion. For a religious person, religion is what it is. There is an absolutism to religion that would make it difficult, if not impossible, for a religious person to look at religion from an intellectual viewpoint. However, the point can be made in the other direction as well. Can an irreligious social scientist properly understand the impact a religion has on a person or a culture without properly understanding the supernatural aspects of the religion itself? This debate about the role of social scientists in analyzing religion is one that continues in political science journals today (see Mitchell, 2007; Wilcox, Jelen, & Wald, 2008).

Pals begins by discussing two anthropologists, E. B. Taylor (1871) and J. G. Frazer (1911–1915), who endeavored in different ways to discover the role of religion in “primitive” societies. They both felt that this investigation would provide insight into how religion developed into such an integral part of the different cultures around the world. Two main themes come from Pals’s discussion of

Taylor and Frazer. First, humans have a basic desire to believe in something greater than themselves. This *animism* can be found contributing to religious traditions as well as other mythological traditions.

The other theme was the desire to explain the seemingly unexplainable. For these societies, much of the world could not be explained. To say these things were magic was one possible explanation, but to form a religion around these events and objects provided an opportunity to rationally explain the unexplainable. This would in turn give order and structure to the culture, as those who understood the “gods” would be granted positions of authority. *Divine right* would become the primary source of legitimacy for governments around the world for centuries, and it still is a source of legitimacy for some governments today. For Christianity, becoming the official religion of the Roman Empire about the year 400 CE gave it an authority that would go nearly unquestioned in many ways for more than 1,000 years.

Although these anthropological studies provide certain insights, they do not directly explain the influence of religion in most of today’s world. Although there are still pockets of “primitive” societies around the world, most of the world has developed far beyond that level. The biggest historical step in this development was arguably the printing press. This enabled people to have access to information themselves. In terms of Christianity, a big reason for the Church’s authority was that no one could read the Bible, including many priests. Many people today, Christians and non-Christians alike, accept the fact that many parts of the Bible can be interpreted many different ways. Prior to the printing press and the Gutenberg Bible, there was no opportunity for individual interpretation.

Among the first wave of challengers to the authority of the Christian Church was Niccolò Machiavelli. Although he was subtle and respectful in his approach (as he had to be at the time in order for anyone to listen to him), it was clear he was challenging the Church as an absolute authority. This challenge would be followed soon by Martin Luther and the Protestant Reformation. Luther, like many other visionaries, was trying only to improve the existing structure by challenging the leaders to address the corruption that had developed. Instead, he ended up inspiring a revolution that changed the face of Christianity around the world.

The power of the exchange of ideas would soon move beyond religion and inspire the Enlightenment. This movement of liberal philosophers spanned the 16th and 17th centuries and represents an important turning point in our discussion. Although John Locke and many of these thinkers still wrote in a religious context, so as not to alienate their potential readers, they wrote about a more secular world. Locke and Montesquieu envisioned a world where commerce was central to people’s lives and secular education was to be of vital importance. They felt people had the ability to reason, and therefore they should

be given freedom to run their own governments (via democracy) and invest themselves in science or commerce as they saw fit. These philosophies, first incorporated by the founders of the United States and since throughout most of the world, have led to industrial revolutions and centuries of unprecedented advancement in science and technology. However, what does all this mean about the role of religion?

Religion had begun to lose its absolute authority in many societies. In addition, science and technology were beginning to provide answers to questions that previously could be answered only by religion. Friedrich Nietzsche, a German philosopher critical of the Enlightenment, went as far as saying that he envisioned a world where God would be dead. Science may not answer all the questions, but if commerce is there to keep us preoccupied, then we may lose our drive to delve into deep issues in which religion could still provide guidance. The bottom line of this view is that religion could well lose its relevance as a significant political force.

This theory gained influence among social scientists of the late 19th and early 20th centuries. Pals reviews the works of three men who reduce religion to an expendable role in their view of the world. Sigmund Freud (1913/1953) saw religion as a form of psychological neurosis that could be eliminated with proper treatment. For Émile Durkheim (1915), religion provides a sense of social order and belonging, things that could potentially be achieved by other means. Karl Marx (1867/1990) saw religion as an illusion that was propagated to maintain the class structure. Each author fit religion into his lens, and each saw it as expendable as a political force.

For the remainder of his book, Pals focuses on social scientists, including Max Weber, who seemed to have a better appreciation for the complexity of religion. Weber's approach to religion and politics is more direct and complex than the social scientists previously mentioned. His signature work, *The Protestant Ethic and the Spirit of Capitalism* (1930), places religion at the center of who we are as a people and what we do. However, at the same time, he says that once these behavior patterns become ingrained in us, they are no longer tied to the religion, making the religion less significant. Therefore, despite his belief that religion is quite important to the formation of cultural values, Weber, among other things, contributed to the growing notion that religion may one day be marginalized.

The Secularization Theory

The dominant paradigm in the social sciences through most of the 20th century centered on the idea that religion was headed toward extinction as a political force. Eventually, this idea was formalized into the *secularization theory*. Peter L. Berger (1969), one of the leading proponents of the theory, said that reason, scientific development, and bureaucratic specialization were among the factors that would

eventually destroy religion as a political influence. As this grand theory was the dominant paradigm for so long, not much was written about religion and comparative politics for decades except for pieces supporting the secularization theory or religion's being an aspect of the qualitative analysis of an individual country's culture. Communism was spreading through the world without the use of religion (overcoming religious obstacles, Marx might say). At the same time, Western Europe was becoming less religious by the decade. The pattern of secularization worldwide, at least in more developed nations, seemed to be clear.

This all began to change in the 1970s. Political scientists began to ask questions about two main trends that seemed to be challenging the secularization theory. First, although religiosity was on the decline in Western Europe and much of the "first" world, this pattern was not as strong in the United States. The second trend was the *liberation theology* that spread through Latin America at that time. In the late 1960s, the Catholic Church held a council called *Vatican II*, resulting in documents that, among other things, encouraged Catholics to be more active in expressing their faith. Latin American Catholics, much to the dismay of the Vatican, interpreted this to mean that they should band together as Catholics and rise up against the oppression of the authoritarian governments that were common in Latin America at the time. This use of religion to motivate a bottom-up political movement was unique and provided evidence that religion was still very much alive as a political force. (For more on liberation theology, see Gill, 1998; Levine, 1986a.)

An article by Daniel Levine (1986b) shows the beginnings of a trend to counter the secularization theory. It is basically a review of books written in the early 1980s that shed new light on changes in religions and their roles in societies. Later, in the introductory chapter to his collection of works titled *The Desecularization of the World*, Berger (1999) recants his previous support for the secularization theory. Berger goes on to say that modernization can have the opposite effect of actually promoting religion. This countersecularization movement can be driven by the people (conservatives) or by elites searching for expanded legitimacy. The bottom line is that the secularization theory, as it stood into the 1980s, is now dead, and the question becomes, Where do we go from here?

Scope of Theory

As has been shown, the prospect of developing a grand theory, in this case one theory that explains the relationship between religion and politics all over the world, is problematic. Freud's and Marx's attempts to incorporate religion into their grand theories left us with more questions than answers. With the demise of the secularization theory and the spread of the bottom-up theory, it might not make sense even to attempt another grand theory. Yet the temptation is always there for the social scientist. There have been two

attempts at a grand theory of religion and comparative politics since 1990 that are worth mentioning here.

In *The Clash of Civilizations* (1996), the late Samuel Huntington sees religion as a major aspect of global realignment after the cold war. The end of the Soviet Union saw the end of 45 years of a global bipolar balance of power. The world had taken sides, and the battle between capitalism and communism dominated the world stage. The question Huntington is trying to answer is, Now what?

In Huntington's vision, religious and other ethnic factors divide the world into two main categories: The West and the rest, or Christian democratic nations (and a few others for strategic reasons) versus the rest of the world (of which the primary unifying force is Islam). Huntington discusses the decline of the, until now, dominant Western culture leading to opportunities for regional conflict to escalate along these fault lines. In his conclusion, he paints a scary scenario about the potential for World War being driven from these divisions, although this scenario is not presented as inevitable, just as an example of how his vision of the world could go wrong.

A counterparadigm for the role of religion in the world comes from *Sacred and Secular*, by Pippa Norris and Ronald Inglehart (2004). They argue that the secularization theory is not a relic; it just needs some modification to properly explain today's world. The theory still applies to the modern industrialized world, taking into account historical differences, but not to the rest of the nations of the world, which have yet to modernize and replace religion as the focal point of their society.

This work is a largely quantitative study using data from the World Values Survey (www.worldvaluessurvey.org/). Basically, the authors apply Inglehart's postmaterialist theory to the role of religion in the world. They say that developed nations get more secular as they get more secure. As a result, postindustrial countries have less religious alignment and lower church attendance. In addition, birth rates are lower in these countries, and therefore Norris and Inglehart see religion actually growing in the world because population rates are increasing faster in the less developed world, which intensifies the line of conflict between the secure world and the third world.

Norris and Inglehart paint a picture much different from Huntington's, and they present data that challenge Huntington's vision. However, there are anomalies in their theory, the primary one being the United States. They explain that the minimal U.S. social welfare system fosters enough economic insecurity in our cities and rural areas to cause religiosity similar to that in areas of the third world. This explanation seems weak because one could easily argue that the homeless person living in a shelter in Los Angeles has a more comfortable life than half of the population of a country like Bangladesh.

While both of these attempts at a grand theory are important, they are arguably oversimplified and incomplete. As such, most of the literature on religion and comparative politics over the past 30 years has been smaller

in scope. Researchers analyze one country or region in depth to try to show a pattern or relationship between variables. They might also compare two countries or regions and try to explain a similarity or a difference between them. Once these connections have been made, it may be possible to generalize the theory from there, but even if not, it is still a valuable contribution to our understanding of the relationship in a particular context. This research is also helpful for comparativists who had previously done qualitative work in a specific area of the world. They can still focus on their region of expertise as they add quantitative analysis.

An excellent example of this regional approach is a compilation of chapters edited by Ted G. Jelen and Clyde Wilcox (2002) titled *Religion and Politics in Comparative Perspective*. Contributors to this book cover issues in religion and politics in countries from Japan to India and Spain, just to name a few. Researchers have written articles of note about Australia (Bean, 1999), China (Weiming, 1999), Israel (Wald, 2002), and many countries around the world. However, there are a few regions that have gotten the bulk of the attention because they provide clear examples for some of the primary theories being currently tested. These countries and regions include the United States, Europe, Latin America, and the Islamic Middle East.

Primary Regions and Theories of Current Interest

Europe

Europe is a good place to start, as it has always been the model for the old secularization theory. Even today, evidence of religious dealignment and very low church attendance abound throughout most European nations, making Europe a unique study.

In the late 1960s, Berger developed the *sacred canopy model* out of the secularization theory and used it to describe these European countries. In those days, many of the countries had a formal church-state institution. Take Catholic Italy, for example. The canopy model says that because of this formal institutional link, a linkage also develops in the culture. It is as if being Italian becomes intertwined with being Catholic to the point it is difficult to distinguish whether a cultural value is distinctly Italian or Catholic. This can be evidenced by non-Catholic Italians professing Catholic values.

The church's going unchallenged has a number of ramifications. First, church attendance lowers (if you are Catholic from birth, you do not have to go to church every week to prove it). Second, a professionalization of the clergy occurs as its members find themselves less connected to their congregants. Finally, government policy and religion grow more connected, which can be positive and negative. Certainly the government stands to gain by

association with this added source of legitimacy. Does religion gain from the alliance? Some say it does by having a more mainstream role in the society. However, others say religion loses by an alliance with government because generally democratic governments strive for compromise and consensus whereas religion is about right and wrong, leaving church and state incompatible. In any case, many European countries to this day provide strong evidence for the sacred canopy model.

This picture has two major complications, however. First is the assumption that low church attendance means a lack of religiosity. Church attendance has always been the signature variable for measuring religiosity because it is data that is easily accessible. One may ask, How are the data acquired? Are they self-reported by people who want to make themselves look good? Or do they come from the church, which also has image motives? While it is not completely reliable, church attendance has always been the best indicator we have. However, with the continuing development of worldwide surveys such as the World Values Survey, this limitation is changing. We can get a more complete picture of a concept such as religiosity with questions about belief in God, belief in hell, the authoritative nature of scripture, and so forth. These new data are very important because comparing church attendance levels in Europe with those in the United States, for example, is just not appropriate without additional evidence to support an inference, whatever it might be.

The other development that is complicating the canopy picture in many European nations (there are a few, such as Ireland, where church attendance and other measures of religiosity are very high) is a trend away from church-state institutions in Christian nations. Many nations that were church-states, such as Italy and Poland, have broken that formal link, and others, such as Norway, are considering such a move. What does it mean to no longer have a formal church-state but to still have a religion with a strong majority status? Is the resulting canopy the same, or do other religions start to come in to compete and change the religious dynamic in the country? Many studies have examined this transformation in Europe (Jelen & Wilcox, 1998) and Latin America (Gill, 1998), where the Catholic Church has always held a strong position.

It should be noted that some religions and religious sects lend themselves more easily to church-states. Islam, discussed later, first comes to mind. Mohammed was a spiritual, political, and military leader. As such, any nation that follows his example can conceive of, maybe even strive for, a combination of church and state. Within Christianity, the institution of Catholicism lends itself easily to a church-state, as has been seen often throughout history. Still, Islam and Catholicism operate well independently of government in the United States, and Protestant church-state systems operate in Norway, England, and elsewhere. Does one religion operate better as a formal church-state than another religion, and what impact does this difference have on the people of the

nation? These are empirical questions that political scientists continue to explore.

Discussing institutions leads us to focus on political parties. One issue that has drawn much attention from political scientists is the “Christian Democratic” parties found throughout Europe. While these started out as Catholic parties, they no longer operate as such today. In most cases, they are relatively liberal parties focusing on poverty and social justice issues. (For more on this development, see Kalyvas, 1998.)

Latin America

The liberation theology movement in Latin America provides a good example of two main themes of research. The first is the debate over whether political institutions work primarily from the top down, or from the bottom up. This debate is central to political parties literature, among other things. The point is not that the institutions have to work exclusively one way or the other. As a matter of fact, the truth may be that sometimes they work one way and sometimes the other. However, it is important to distinguish whether the position of a politician on abortion affects public opinion or vice versa. Many political scientists take a top-down approach, trying to show the power of the elites, including religious elites, to manipulate public opinion. As mentioned before, the liberation theology movement reminded researchers not to ignore the bottom-up approach. In any form of legitimate democracy, the people still have power, and under certain conditions they may actually decide to use it. Under other forms of government, the people can take power, but to do so requires a deep commitment, something religion can provide.

The second key concept illustrated by liberation theology is the importance of civil society and social capital (for an explanation of these concepts, see Chapter 23, titled “Civil Society,” in this volume, or Putnam, 1994, 2000). Religion is in a unique position to generate social capital for two reasons. First, its institutions are in place, connecting people to each other and encouraging them to meet on a regular basis. Second, religions generally promote the volunteering of time and money in order to accomplish things that, in many cases, an individual will not benefit from directly. This selfless giving is not easy for many people and intensifies the connection among those who are willing to participate in it. It also commits people to the idea that there is something more important than themselves to work for. Religion has powerful potential for social action because the institutions to organize the people are there and religion has the power to motivate the people and put them in the right frame of mind for collective action. Whether that action is sparked by elite discourse or from the grass roots can vary.

The United States

Although a great deal of work has been done regarding religion and social capital in the United States (see Smidt,

2003), the concept of social capital is only a small part of what makes studying religion and politics in the United States fascinating. As a large country that uses a federal system of governance, the United States comprises state-to-state and regional differences that are interesting to study. In addition, the availability of survey data makes research easier for the political scientist. All these issues and others are covered in more detail in Chapter 98 of this volume, titled “Religion and Politics in America” (see also Wald, 2003).

This chapter focuses on one central issue that sets the United States apart from the rest of the world. As Europe has always been the best example of secularization, the United States was always the outlier. A high level of religiosity remains today, and the influence of religious groups in politics has actually increased since the 1980s in a country that tries to present itself to the rest of the world as a leader in secular concerns such as democracy and capitalism. What makes the United States different?

Many argue that the religiosity in the United States is best explained by the establishment clause in the First Amendment to the Constitution, which separates church and state. Because of the “religious free market,” churches find themselves competing for members. This competition creates a buzz that increases overall levels of religiosity. In an economic analogy, this is a supply-side approach (for the most complete work on this dynamic in the United States, see Finke & Stark, 1992). A large body of research deals with the religious marketplace in the United States.

One of the weaknesses of comparative politics in its early decades (1950s and 1960s) was U.S. ethnocentrism, a normative approach that assumed other countries would eventually want to be like the United States, and so social scientists should help them do that. Today, comparativists are much more empirical and appreciative of differences in culture. In this case, however, the U.S. example is very unique. In few places in the developed world are people as religious and the politics as affected by organized religious groups. Debates in the United States over issues such as same-sex marriage and abortion have strong religious overtones. Some political scientists have observed that since the 1980s the two political parties have become more divided along a religious versus secular fault line. If the marketplace model explains these trends, then it makes sense to see to what extent the marketplace model can be applied around the world.

Scholars have taken this model and applied it to Europe with limited success (Jelen & Wilcox, 1998). The supply-side approach can be used to investigate how much of a majority a sect has to have before a sort of religious canopy sets in. Recent research in Latin America has shown that countries in which the members of a single religion number more than 85% of the population represent the canopy model, and when the percentage of the population following a single religion falls below 85%, elements of the competition model begin to appear (Gill, 1998). It appears that a supply-side approach to religion and politics in other countries may help explain observed behavior.

This economic model suggests another dynamic as well: the rational choice model (see Chapter 5, titled “Rationality and Rational Choice,” in this volume). Religious people are not seen as rational actors because they do what God tells them, not necessarily what would maximize their utility according to secular scales. Incidentally, this logic illustrates a flaw with rational choice theory. If getting to heaven is maximizing utility, then doing what you understand God is asking of you is completely rational. Regardless, the point here is that using the supply-side economic model leads researchers to consider churches and religious elites as rational actors who are trying to maximize their utility or get more members. This possibility opens up opportunities for theories and research, not only in the United States but around the world (see Gill, 1998; Warner, 2000).

The Middle East

One of the biggest questions facing social scientists today is whether Islam is compatible with democracy. The overwhelming widespread trend toward democracy during the past 20 years has, for the most part, missed the Islamic world. The evidence clearly indicates democracies are considerably less likely to fight with each other, so promoting democracy, besides being a good thing normatively, would seem to have security value. What is it about Muslim countries that makes it difficult for democracy to take hold? To what extent can Iraq and Afghanistan answer this question if their democracies have been forced on them from outside?

This point should be left in. Scholars trying to determine answers have focused attention on many aspects of Islam and the Muslim people (see Tamadonfar, 2002). Many factors have been shown to effect democratization in general (Przeworski, 1996). In addition, most of these countries are known as *rentier states*, referring to a resource curse that may be the biggest factor hindering democratization in the Middle East. Of course, many of these factors may be working in concert. The complicated relationship of religion and politics does not operate in a vacuum. Outside factors are constantly influencing the outcomes, making the relationship that much more difficult to study.

Future Research

The possibilities for future research in this field are immeasurable. Religion is and will remain an important factor in politics all over the world. The growing possibilities for survey research in the Islamic world are exciting. Africa and the rest of the developing world offer opportunities. As survey data begin to emerge from all corners of the globe, political scientists can begin to explore some of the issues faced in other nations.

For example, most of the previous work done with regard to identity politics in the developing world has focused on ethnicity (see Horowitz, 2000). Although this

work is important, the focus on ethnicity can marginalize the perceived impact of religion. Religious differences are many times included with ethnic differences when appropriate; otherwise they are often not considered. There is a definite need for an equally strong focus on the religious aspects of these issues.

It is true that religion and ethnicity have much in common and, in many cases, interact a great deal. Both concepts are important to individuals and can elicit strong emotional responses. Both are unifying forces that can bring a group together and potentially define an enemy group. Both contribute to cultural and historical identities that, along with national identities, are used to define the world stage (Huntington, 1996; Jelen & Wilcox, 2002). In many cases, divisions among groups can be both ethnic and religious. Examples include divisions in the former Yugoslavia and many other places around the world. In some situations, it can be difficult to separate the impact of religious divisions from that of ethnic divisions.

Yet the concepts of religion and ethnicity can also play different roles in society. To begin with, they can have different foundations and historical significance. Although religious conflicts sometimes line up along ethnic lines (e.g., the Christian Croats and the Muslim Bosnians), there are also examples of religious conflict that overrides ethnicity (e.g., Iraqi Shi'a and Iraqi Sunni) or of ethnicities that combine under religious banners (as in Nigeria). Furthermore, religion may be more important than ethnicity to one person or group (e.g., Muslims) whereas ethnicity might be more important in another culture (e.g., Han Chinese). Most important, however, the groups are organized differently, and that organization can play a major role in how they can operate in society.

Religion generally has formal institutions in place that allow it to be well organized in society. An ethnic group is generally less well organized than a religion. An ethnic group does not necessarily have a supreme authority (unless the ethnic group is tied in with a religious group). There is likely leadership of some sort as a hierarchy is developed, especially in situations in which the groups are unranked. However, ethnic groups do not necessarily have a positive formal mechanism for membership or mobilization such as the church offers for religion (Horowitz, 2000).

From this institutional perspective, religion seems to be in a much stronger position to influence something like democratic stability in the developing world. The success of a newly formed democracy depends, to a large extent, on the ability of the new formal institutions to be perceived as legitimate by the people. The institutions that are already in place and respected in a country will be expected to provide a cue to the public on whether to accept the new system. Although similar to the endorsement of an ethnic leader, religious endorsement goes farther, for two reasons. First, an endorsement of democracy from the religious leadership could be interpreted as coming from a higher power. Second, the church has

formal institutions in place to mobilize the masses to accept democracy. Churches can align their message with the ideology of freedom and democracy, register people to vote, and perform many other functions to promote the new system.

In addition, the structure of the religious institutions can provide insight into culturally accepted norms of hierarchy. Tapping into a religious organization is tapping into the social and informal political institutions and links they might already have in place. These points reinforce the important institutional arguments that help us understand how support from religion could make the difference in certain new democracies. The bottom line is that the ultimate way a religion can promote the legitimacy of a democratic government is to participate in it.

Conclusion

The field of religion and comparative politics is as strong as it has ever been. A tremendous amount of work has been done in the past 20 years. However, there still is a lot of extremely important work to do. Most of the conflicts around the world have some sort of religious overtone. If people in the United States, for example, can gain a better understanding of how Islam operates in Islamic countries, that understanding will help break down some of the barriers that keep us apart.

ETHNIC AND IDENTITY POLITICS

DWIGHT VICK

West Texas A&M University

JOHN T. ISHIYAMA

University of North Texas

The focus of this chapter is on the central concept of ethnic identity and its effects on politics. In particular, it focuses on the importance of ethnic identity politics from a comparative perspective. Although an enormous amount of literature on ethnic identity has been produced in anthropology and sociology, this chapter concentrates on the still voluminous literature in political science.

This chapter covers the general political science literature that addresses the following questions: (a) What is meant by the concept of ethnic identity? (b) How does an ethnic identity form and change? (c) What is the relationship between ethnicity and national identity? (d) What are the political consequences of ethnic identity (especially in terms of voting and political parties)? Finally the chapter turns to some future research questions that can be derived from this coverage of the literature.

What Is Ethnic Identity?

What is generally meant by such terms as *ethnicity*, *ethnic group*, and *ethnic identity*? The terms are derived from the Greek term *ethnos*, which has been generally translated to mean *nation* or a community of people who share a common language or culture. Although much of the early understanding of *ethnic groups*

treated these communities as natural (often conflating ethnicity with race, e.g., the German race, the English race), the notable 19th and early 20th century German sociologist Max Weber argued that ethnic groups were artificial and socially constructed. Essentially they were based on a subjective belief in a shared community. This belief is what created the group, and the motivation for creating a group derived from the desire for political power. This was very much in contrast to an earlier belief in the 19th century that held that sociocultural and behavioral differences between peoples stemmed from inherited traits and tendencies derived from common descent, or race. Later Fredrik Barth (1969) went even further, arguing that ethnicity was forever changing and that the boundaries of membership in an ethnic group are often negotiated and renegotiated, depending on the political struggle between groups.

Many social scientists have since noted the malleability of ethnic group boundaries. Thus, Joan Vincent (1974) has noted that ethnic boundaries often ebb and flow and have a rather mercurial nature. Ronald Cohen (1978) also pointed to the instrumental nature of ethnic boundaries, arguing that ethnicity “can be narrowed or broadened in boundary terms in relation to the specific needs of political mobilization.” This may be why descent is sometimes a marker of ethnicity and sometimes not—ultimately it depends on the political situation.

However, as Liah Greenfeld (1992) and many others have noted, this does not mean that ethnic identities are merely “imagined” and completely malleable and porous. Rather there are some objective characteristics that constrain identity. For instance, a Japanese American cannot suddenly declare herself to be an Ethiopian and be accepted as such in Ethiopia. Generally, others will not regard her as Ethiopian (because she does not “look it” or because she cannot speak Amharic or any other national language of Ethiopia). In other words, objective attributes constrain what can be subjectively imagined.

Thus the modern literature in comparative politics has used ethnicity as a concept that embraces these attributes. For instance, the notable scholar of ethnic politics Donald Horowitz (1985) has referred to the concept of ethnicity as a broad term that “easily embraces groups differentiated by color, language, and religion; it covers ‘tribes,’ ‘races,’ ‘nationalities,’ and ‘castes’” (p. 53). Much of the more recent literature also uses the term *ethnicity* in very much the same way—as a term that includes many other markers of identity (see, e.g., Chandra, 2004; Posner, 2005).

A very useful synthesis of objective and subjective views of ethnic identity, but one that is also more precise than previous broad conceptions, is provided by Kanchan Chandra (2006). She suggests a very useful definition of *ethnic identity* that draws on both subjective and objective views. She argues that “ethnic identities are a *subset of identity categories in which eligibility for membership is determined by attributes associated with, or believed to be associated with, descent*” (p. 398, italics added). By *ethnic identity*, she means a social category in which “eligibility for membership is determined by descent-based attributes” (p. 398). These attributes include both objective features and subjective beliefs. Thus attributes include the following:

[those] acquired genetically (e.g. skin color, gender, hair type, eye color, height, and physical features), or through cultural and historical inheritance (e.g. the names, languages, places of birth and origin of one’s parents and ancestors), or acquired in the course of one’s lifetime as markers of such an inheritance (e.g. last name, or tribal markings). Further, it includes attributes believed to be associated with descent, which mean attributes around which a credible myth of association with descent has been woven, whether or not such an association exists in fact. The definition thus includes both a subjective and an objective element. (Chandra, 2006, p. 399)

How Does Ethnic Identity Form?

Much of the literature in comparative politics has suggested that ethnic identity is one of the most powerful forces shaping political attitudes and mass political

behavior (Brubaker, 1992). Ethnicity is a type of group-based social identity, along with other group-based identities (such as class and clan), but ethnicity has had a particularly powerful effect on political behavior in the late 20th and early 21st centuries. Generally speaking, the early scholarship on ethnic identity formation was characterized by two broad debates (Eriksen, 2001), or what might be referred to as the primordial versus the situational perspectives.

The first approach (*primordialism*) generally holds that ethnic identity is innate and natural in some way. Anthony Smith (1986) identifies a variety of different kinds of primordialisms, including *essentialist primordialism* and *kinship primordialism*. Essentialist primordialism holds that ethnicity is a natural biological fact, and thus ethnicity precedes human society. This approach has had relatively little impact on scholarship, although it has been forwarded politically by racial supremacists from time to time. More common in the primordialist literature is kinship primordialism, which holds that ethnic groups are the extensions of blood kinship communities. A version of this is the perspective offered by Clifford Geertz, who acknowledges that ethnic identity is not entirely “in the blood” but that ethnic ties and group bonding are somewhat natural processes (because objective racial or physical features assist the creation of social bonds). In particular, from this point of view, ethnic ties represent a permanent social bond that is self-sustaining and not subject to human manipulation (Geertz, 1973). Indeed, Geertz argues that because people attach so much to certain socially objective markers such as race, religion, language, and culture, they perceive ethnicity as primordial and natural.

On the other hand, the *situational perspective* (also known as the *constructionist* or *instrumentalist* approach) states that ethnic identities are socially constructed. In other words, the definition of the group, and the identification of its boundaries, are often negotiated and renegotiated, and how these boundaries are redefined depends on specific situations and circumstances that each group encounters. The basic cognitive processes of self-categorization and self-schematization (Turner, 1985), combined with social interaction (Burke & Reitzes, 1981), produce intersubjective agreement that (almost) every person can be placed into categories described in terms of some easily perceived attributes. People attach themselves to these groups, and the strength of these attachments or commitments (Burke & Reitzes, 1981) affects people’s lives and activities.

The instrumentalist approach is more cynical than the simple notion that identities are social constructions. Instrumentalists see the creation of identity as the product of the manipulation of cultural and kinship symbols by political entrepreneurs for political gain (Cohen, 1974). This approach sees ethnicity as result of political strategy, usually to achieve other ends, such as political

power, access to resources, and increase in wealth and status.

Within the situational perspective, several subtheories attempt to explain how ethnic identity is formed and reshaped. Some sociologists, for example, have argued that ethnic identity can be resurgent or emergent. Those who believe in a *resurgent* ethnic identity accept the idea that traditional or ancestral identities can reemerge as the result of particular historical circumstances. For instance, groups that have been stripped of their previous heritage (such as Native Americans) or assimilated (such as many groups in the former Soviet Union) have experienced a resurgence of pride in traditional identities. This has happened in the 20th century in North America and, in the former Soviet Union after the collapse of Communism, for ethnic minority groups such as the Tatar and Bashkir and new majority groups such as Kazakhs and Kirghiz.

On the other hand, an emergent ethnic identity involves the creation of a new sense of group identity that may emerge as the result of particular circumstances. For example, Japanese Americans in the United States, largely as the result of World War II, have formed an identity quite different from being either Japanese or entirely “American” (Nagel, 1994). Indeed, as policies and context lead to contested identities, individuals may go so far as to create new identities, which become shared.

Last, considerable recent interest has focused on how ethnic identities change, particularly after group circumstances change. This approach is based on the notion that contextual changes affect the relationships between peoples. As several scholars have noted, economic, social, and political changes shape the context affecting groups and individuals (Anderson, 1983; Hobsbawm, 1990; Posner, 2005). This is because the very attributes that shaped identity before are suddenly in flux. During times of disruption (e.g., in post-Soviet politics), dimensions such as language, tribe, or region may be used by political entrepreneurs to restructure groups based on new identities (Posner, 2005).

With the emergence of newly independent nations from the former Soviet Union and the former Yugoslavia, the issue of ethnic and national identity has changed as well. Changes in the ranking of individual groups affect the development of identities. The character of the ranking systems (Horowitz, 1985) affects whether individual ethnics will try to change identities or must attempt to change the status of their group in order to improve their conditions. Horowitz (1985) contrasts the two systems as follows:

[In unranked systems] one need not choose between his mobility aspirations and his group membership, whereas in ranked systems elite status is possible for members of a subordinate group only if they are willing and able to renounce their origins by passing into the superordinate group. (p. 35)

Thus, for example, groups such as Kazakhs in Kazakhstan, which were ranked below Russians in Kazakhstan during the Soviet period, are now ranked above Russians in Kazakhstan. This makes Kazakh identity more attractive than a Russian identity for many who live in Kazakhstan.

What Is the Relationship Between Ethnic and National Identity?

A second debate in the literature on ethnic identity, as identified by Thomas H. Eriksen (2001), is the debate within nationalist studies between constructivism and essentialism, or how national identities emerge as a product of ethnic identities. This involves the debate over whether national communities are created consciously or whether they grow organically out of preexisting cultural communities. In nationalism studies, this debate is highlighted by the differences between Smith (1986) and Ernest Gellner (1983). Gellner argues that nations are entirely a product of modernization. Gellner is not alone in this point of view. For instance, the Marxist historian Eric Hobsbawm also argues that ethnicity and nationalism are wholly modern inventions, appearing only after industrialization and modernization in world history. Thus, from this point of view, industrialization and urbanization created the basis for mass national identities. For instance, prior to industrialization, national identities did not exist. Generally, identities were local, not national. Thus, for instance, a Romanian peasant in the early 19th century was likely to identify with his or her local village or district, not with a community known as Romania, which did not exist politically (the region now known as Romania was then part of the Ottoman Empire). However, as economic modernization advanced, accompanied by the movement to urban areas, people became connected in ways that transcended local identities. People realized that there were now others who spoke the same language and who shared the same cultural practices. This created the basis for a mass identity, such as Romanian. Subsequently, the state creates a new history that proclaims that the nation has ancient roots that have existed for millennia (Gellner, 1983).

Benedict Anderson (1983) also argues that in many ways nations are “imagined” communities that are created, although unlike Gellner, he sees no necessary connection with particular ethnic groups. Gellner sees nations growing out of ethnic communities (such as the Romanian example above). Anderson, on the other hand, observes that nations can include many ethnic groups but that the national community is a community that binds people together nonetheless (for Anderson the Philippines and Indonesia are cases in point).

On the other hand Smith (1986, 1991) has argued that every nation has an ethnic core and that nations are not

simply imagined. He has pointed to the importance of preexisting *ethnies*, which are required for the development of nationalism. An *ethnie* is defined as a population with a shared proper name, a common ancestry, shared historical memories, a shared culture, and an association with a particular territory. Nations grow out of these groups. Indeed, Smith argues that nationalism draws on the history of particular groups to fashion a sense of identity.

Greenfeld (1992) shares this perspective and argues that nations are not just “imagined communities.” However, she says that national identities are not completely fixed, either. Rather, whether an individual chooses to identify with a particular national community depends to a large extent on the individual’s personal experiences. In *Nationalism: Five Roads to Modernity*, she outlines the process by which individuals link their personal experiences with the development of a collective identity or nation. Greenfeld contends that one must experience a social, political, psychological, religious, or cultural event that encourages the person to accept a community. As rites and initiations occur, the meanings of these situations build on each other until the individual identifies within the community and accepts or rejects its traditions. In either case, the person, through self-selection or marriage, connects with a group that creates a community and a nation. Further, several social institutions support the sustenance of a community: family, schools, peers, religion, the community norms, its media, and life events.

A related issue regarding the creation of national identity is the question of who belongs to the national community—that is, what are the criteria for membership in the national club. Indeed, several scholars have distinguished between communities that have different criteria for membership, particularly the difference between *ethnic* nations and *civic* ones (Smith, 1991). Rogers Brubaker (1992), for instance, found that the French and German conceptions of nation and nation-state are very different. France has historically emphasized loyalty to the state and acceptance of French culture and ideas as the key criteria for citizenship. Thus there is an emphasis on assimilation of peoples, regardless (technically) of race or other physical characteristics. On the other hand, the German conception of national community is based on the concept of the people (*Volk*), or the idea that an ethnocultural community is based on “blood.” These divergent approaches to national community partially explain the different ways in which countries approach issues of citizenship and immigration. In France, citizenship is based on acceptance of the French language and culture. Immigrants are expected to assimilate into the French community by adopting these attributes. In Germany, on the other hand, the emphasis on an ethnic community means that blood connections are far more important as a criterion for membership in a national community than is cultural assimilation. In fact, cultural

assimilation is simply not enough to gain membership in the national community.

Greenfeld (1992) argues that these different kinds of national identities affect the kinds of nationalisms that emerge. She suggests that there are three basic types of nationalism: individualist-civic, collectivist-civic, and collectivist-ethnic. *Individualist civic* nationalism identifies a collection of individuals who come together in civic life and abide by its conventions. The national community is primarily held together by some loyalty to a set of principles, as opposed to some mystical notion of *volk*. Nationalism in the United States represents this type. In *collectivist civic* nationalism, loyalty to the state defines membership in the national community, and this loyalty is often accompanied by a demand to assimilate to the dominant culture. France represents this type of nationalism. Finally, there is *collectivist ethnic* nationalism, which is the most exclusionary and is based on the idea that the national community is defined by blood. Germany, particularly in the past, would fit this type of nationalism. Often this form of nationalism is directed from above and exclusionary of outsiders.

Some Research Directions

The issue of ethnic identity has been an important research issue in comparative political science. Two research agendas illustrate some of the scholarship in the area: (1) the effects of ethnic identity on voting and (2) the effects of ethnic parties on new democracies.

Ethnic Voting

Scholarship has a long-standing interest in elections and voting behavior in “divided” societies. Indeed, many scholars have worried that elections in ethnically divided societies will produce *census elections*, which are inimical to democracy. In other words, such elections tend to create impermeable blocs that detract from interethnic accommodation. Rather than creating harmony and stability, elections in ethnically divided societies become an invitation to fraud and open conflict as groups struggle for political dominance (Horowitz, 1985; Rabushka & Shepsle, 1972). The most common explanation for census-style elections is Horowitz’s (1985) *expressive voting hypothesis*, which contends that voters employ the act of voting to express (and hence register) their identities as part of an ethnic group. This practice in turn gives rise to ethnic parties, which, through the process of *ethnic outbidding*, lead to the hardening of ethnic positions, which reduces the possibility of ethnic accommodation and ultimately leads to the dissolution of incipient democracies.

A prominent theme among scholars studying voting in new democracies is the enduring relevance of ethnicity in

the developing world, where “ethnic ties based on kinship and family, language and dialect, tribal customs and local communities, as well as shared religious faiths, have long been regarded as playing a critical role in party politics” (Norris & Mattes, 2003, p. 1). For some, such as Letitia Lawson (1999), ethnicity is an alternative basis for political mobilization and an almost natural process in Asia and Africa, a process she describes as follows:

Absence of formal associations clearly apart from the state and capable of engaging the population, the introduction of liberal democratic procedures, at the behest of external donors, [all this] has led political parties to appeal to the only available alternative: ethnic identity. (p. 12)

While there is a general consensus that ethnicity is an important cleavage in many countries, there has been considerable debate over *why* voters may vote along ethnic lines. Some have argued that voters vote for ethnic candidates because they believe that “their” candidates will deliver patronage resources to them. For instance, Chandra argues that ethnic voting is often the product of *patronage democracies*, in which the state monopolizes access to jobs and administrative resources (Chandra, 2004). Such states, in the search for legitimation and popular support, often engage in *selective targeting*, whereby certain groups are selected to receive the most benefits from state resources. Hence, voting aligns along ethnic lines largely out of the expectation for patronage benefits. In this way, ethnic identity offers an informational shorthand, telling voters that voting for a coethnic candidate or party will more likely result in benefits for the voter than will voting for a candidate or party from another ethnic group. Thus, voters believe that benefits are more likely to result from demonstrating solidarity with the community. In other words, they share a sense “that only a member of their own ethnic group may end up defending the interests of the ethnic group as a whole, and that voting for a member of another ethnic group will certainly not do so” (van de Walle, 2003, p. 313).

A second approach emphasizes the coincidence of ethnicity with policy preferences and voter evaluations of the performance of the government. Indeed, it may be the case that what appears to be an ethnic bond among voters is actually the result of voters’ sharing common policy preferences that drive them to vote in similar ways. For instance, Robert Mattes (1995) notes that in divided societies, individuals from the same ethnic group have common preferences because they often share common political and economic interests. Because preferences form as the result of social interactions and individuals within ethnic communities tend to interact only with other members of their own group, shared patterns of interests result. Thus, it may appear that ethnicity is the cause of voting behavior, but in reality ethnicity is merely a correlate of other interests. Karen Ferree (2004) refers to this as

the *policy framework approach*, whereby voting is driven not by identity but by a common set of interests. Indeed, voter choice often appears to be primarily reflective of ethnic identity when it is actually reflective of a common set of frustrations with government performance. In this situation, ethnicity plays no direct role in shaping voting behavior. That ethnicity overlaps with behavior is largely happenstance.

Last, the *ethnic expressive voting* approach suggests that voters vote for coethnic candidates because the act of voting is a psychological affirmation of group identity. The most prominent advocate of this approach is Horowitz (1985). Horowitz argues that to vote for an ethnic party is to affirm group identity, and voters thus derive psychological benefits from supporting ethnic parties. Since voting is not a product of rational calculation, partisan allegiances are rather fixed and rigid, and elections become a reflection of demographics. Such voting implies that voting is not the outcome of a careful evaluation of policy positions or the performance of leaders; instead, it is identity that matters. As Stanley Fish (2008) notes, the heart of identity politics is that voters vote for or against someone because of the candidate’s personal characteristics. “In essence, identity politics is an affirmation of tribe against the claims of ideology” (p. A13).

Ethnic Parties, Conflict, and Accommodation

Related to ethnic voting is the topic of ethnic parties, which is often seen as the organization product of ethnic identity voting. Indeed, there has been a long-standing interest in the role played by ethnic parties in promoting (or dampening) conflict between ethnic groups. Many scholars have argued that the appearance of ethnic parties is a “bad” thing for new democracies or systems in transition. From this perspective, not only does the emergence of ethnic parties deepen divisions between groups, but ethnic parties serve to exacerbate conflict (Hislope, 1997).

Alvin Rabushka and Kenneth Shepsle (1972) offered one of the earliest explanations of the way in which ethnic parties promote conflict in plural societies. In their model, a key role is played by ethnic elites and the organizations they lead. Indeed, these organizations engage in the politics of ethnic outbidding that ultimately undermines multi-ethnic cooperation and inevitably leads to nondemocratic, ethnically exclusive states. Other authors have similarly argued that because ethnic parties make their political appeal specifically on ethnicity, their emergence often has a centrifugal effect on politics. This effect is especially harmful to new democracies, where democratic institutions are quite fragile. Indeed, under such conditions, ethnic competition can easily turn into ethnic conflict. This is because the competition for votes for the ethnic party involves mobilizing the ethnic group, and the best way to do that is to use inflammatory and confrontational rhetoric, distinguishing between “us” and “them” (Koelble, 1995).

Richard Gunther and Larry Diamond (2003) have described this process as follows:

The electoral logic of the ethnic party is to harden and mobilize its ethnic base with exclusive, often polarizing appeals to ethnic group opportunity and threat. . . . The ethnic party's particularistic, exclusivist, and often polarizing political appeals make its overall contribution to society divisive and even disintegrative. (pp. 21–23)

In addition, ethnic parties indirectly contribute to worsening ethnic tensions by promoting party politics along cultural lines, which often leads to the marginalization and exclusion of a cultural minority. As a consequence, such minorities may feel encouraged to resort to undemocratic or even violent means in order to counter this treatment. Further, merely by promoting identity-based politics, ethnic parties can significantly raise the stakes of the political game, reinforcing group identities and thus raising the likelihood of conflict. For these reasons as well, ethnic parties increase the likelihood of intercommunal conflict and threaten the survivability of new democracies.

Thus, from the foregoing perspective, the mere appearance of an ethnic party should signal an increase in the rise of interethnic conflict. Horowitz (1985) has described the phenomenon in the following terms:

By appealing to electorates in ethnic terms, by making ethnic demands on government, and by bolstering the influence of ethnically chauvinistic elements within each group, parties that begin by merely mirroring ethnic divisions help to deepen and extend them. Hence the oft heard remark in such states that politicians have created ethnic conflict. (p. 291)

On the other hand, several scholars contend that ethnic parties can play a constructive role in promoting intergroup accommodation. Indeed, advocates of the consociational school have long argued that promoting the emergence of ethnic parties and then representing them broadly will facilitate the integration of as many subcultures as possible into the political game, thus creating the conditions for interethnic cooperation (Daalder, 1974; Lijphart, 1968). Furthermore, securing representation for minority groups facilitates the integration of disaffected groups into the political system, which ultimately leads them to moderate their demands. Frank Cohen (1997) argues that the broader the representation, the more likely the ethnic group feels bound to the existing system. As Cohen puts it, "By making institutions more accessible and making ethnic cleavages more explicit, ethnic groups will engage in more frequent but less intense conflict. They will use moderate means of resistance to effect change in the status quo" (p. 613).

Others, such as Sherrill Stroschein (2001), contend that ethnic parties do not cause ethnic conflict but emerge as the result of it. That is, they reflect differences that already

exist. Nonetheless, ethnic parties can channel demands into more legitimate forms of participation and thus allow conflicts to be resolved politically rather than through violence (p. 61). John T. Ishiyama (2000) demonstrated that in the post-Communist world, ethnic parties have assisted in bringing into the political process those who otherwise would have been alienated by the emerging democratic systems in the region.

Current research, such as that by Johanna Birnir (2007), Chandra (2004), James Fearon and David Laitin (1996), and Daniel Posner (2004), offers a more contingent view of the link between ethnic cleavages and conflict and stresses the importance of ethnicity and ethnic cleavages as cost-effective strategic resources for group formation, interest definition, and collective action. Perhaps one of the strongest and most articulate proponents of the notion that ethnic parties can have a positive effect on the stabilization of new democracies is Chandra (2005). She directly criticizes the notion of ethnic outbidding, which is so central to the argument that the mere appearance of ethnic parties sets off a chain reaction leading to a spiral of extremism that destroys democratic politics altogether. Rather, she argues that ethnic parties can help sustain democracy if these parties are institutionally encouraged to compete on multiple dimensions rather than on just the unidimensional axis of ethnicity. Indeed, political institutions that restrict "ethnic politics to a single dimension destabilize democracy, whereas institutions that foster multiple dimensions of ethnic identity can sustain it" (Chandra, 2005, p. 236).

In a similar vein, Birnir (2007), in examining patterns of ethnic politics in a broadly comparative way, contends that the ethnification of politics does not necessarily translate to violence. Indeed, like Chandra, Birnir argues that ethnic identity serves as a stable but flexible information shorthand for political choices and assists in stabilizing party formations and hence the development of democracy. If violence results, it is largely the result of political institutional factors, particularly restrictions on access to the executive. This exclusion is what leads to violence, not the political mobilization of ethnicity.

Birnir argues that, *ceteris paribus*, ethnic parties (which she refers to as ethnic *attractors*) are predisposed to seek peaceful means to gain access to political power. This is because, as with all parties, ethnic attractors seek to act on behalf of a constituency and seek leverage for that constituency. In turn, voters who use ethnic identity as a shortcut to sort through candidate preferences prefer parties that act on behalf of the ethnic constituency (this party could be a nonethnic party as well). This factor provides a strong incentive for the ethnic attractor to gain access to the political executive, which is best achieved through peaceful means.

Why is it the case, then, that members of some ethnic groups appear to peacefully support their group in electoral

politics whereas others do not support their groups, exit electoral politics, and even engage in protest and violence? Birnir's answer is that if political intransigence and violence result, it is not because of the ethnification of politics but rather the denial of political access to an ethnic group. It is the shutting out from the core of power that produces the kinds of violence and instability that are commonly associated with ethnic politics in the existing literature.

Conclusion

This chapter has sought to summarize the basic literature on ethnic identity politics, a subfield of comparative politics. Although its coverage is not entirely exhaustive, it provides the reader with a basic understanding of the underlying debates regarding the central questions addressed in the literature: (a) What is ethnic identity? (b) What leads to the formation of an ethnic identity? (c) What is the relationship between ethnic identity and political movements such as nationalism? (d) How are issues of ethnic identity explored in the literature on comparative ethnic voting and ethnic parties? Furthermore, with the changes wrought by the end of the cold war and the emergence of new states and new identities from the former Soviet Union, as well as in other parts of the world, the answers to questions about how identities change are now accessible to scholars. Indeed, unlike in the past, when analyses of national and ethnic identity formation were largely derived from secondhand observations of history, the process of identity formation is unfolding in front of us. This provides new opportunities and new research directions that represent exciting new paths for future inquiry.

SOCIAL MOVEMENTS

MARC HOOGHE

University of Leuven

Social movements can be conceptualized as sustained and enduring challenges to political decision makers in order to achieve some form of social change. Although social movements most often are composed of one or various social movement organizations, various authors have emphasized that social movements should not be identified solely with those organizations. Individual actions, cultural manifestations, the activity of opinion leaders and other elements of cultural change, and consciousness-raising can also be labeled as elements of social movements. Although social movements are studied mostly within the field of sociology, they are also of crucial importance within political science. It can be argued that some of the most important political changes in the 19th and 20th centuries were brought about by the actions of social movements. Powerful examples are the civil rights movements in the United States, the green movement, and women's organizations, but one could also think about organizations aimed at promoting gay rights or the protest against authoritarian regimes in Central and Eastern Europe in the 1980s. Social movements therefore are usually identified with contentious politics: They try to bring about political change by challenging the political elite. As such, they give voice to those who have been excluded from the political system.

Social movements can be distinguished from political parties as they do not directly compete in elections and they do not participate in exercising state power by means

of elected officials. In various instances, however, there are examples of social movements that are linked quite narrowly to political parties. Social movements can also function as interest groups, but mass participation of citizens is usually considered as a defining element of social movements, and it is not necessarily a defining element of interest groups. This distinction from political parties does not prevent social movement organizations from trying to have a direct impact on political decision-making processes. Participation is thus an important element of social movements, and although social movement participation cannot be considered as a standard form of institutionalized political participation, most authors agree on the fact that social movement participation is or has become an important element in the political action repertoire of citizens in liberal democracies. Social movement organizations themselves use a wide array of activities (demonstrations, strikes, newsletters, lobbying techniques, print, etc.) to reach their goals of mobilizing their constituency and to have an impact on political decision making.

Within political science, the study of social movements has received considerable attention. Whereas in the first half of the 20th century, social movements were usually depicted as a potential threat to political stability, the idea emerged, in the 1960s especially, that social movement participation could be seen as a normal and even necessary element within democratic political systems. In the development of the study of social movements,

scholars have successively emphasized the resources that are necessary to sustain social movement organizations, the cultural meaning of social movements, and the political conditions that facilitate the occurrence and the success of social movements. In the more recent literature, authors have highlighted the network structure of movements, the emotional motivations of participants, or the political and cultural consequences of social movement activity. From a review of the current literature, it seems clear that there is no longer one dominant paradigm in the study of social movements. Rather, it is acknowledged that in order to arrive at a comprehensive study of the phenomenon, organizational, cultural, and political insights should be combined.

Development of Social Movement Studies

Early Approaches

In the early 20th century, social movements were mostly studied as a form of collective behavior, and this line of research was heavily influenced by the insights of crowd psychology. It was feared that individuals would lose their rationality once they participated in crowds because they would give in to a propensity to follow crowd leaders. Collective behavior could easily lead to mass gatherings, mobs, riots, and even forms of collective violence. This kind of crowd behavior was considered a potential threat to the stability of the political system. This negative conception of social movements can be explained by two distinct elements. On one hand, it should be remembered that this era indeed witnessed a number of unruly forms of participation, leading to political violence, attacks, and other forms of social disruption. On the other hand, it was also clear that sociologists and political scientists apparently identified with the current political and social order, seeing attempts to change the structure of society as a threat to political stability. In other scientific disciplines, too, an elite distrust of mass behavior was quite clearly present during this period. This conservative outlook was especially present in the seminal work of the French social psychologist Gustave Le Bon (1841–1931). In his work published in English under the title *The Crowd* (1895/1977), Le Bon stated that participants in mass gatherings displayed a tendency to behave in a herdlike manner, blindly following their leaders. The stability of society was ensured by a rational elite that was able to oppose the claims of unruly mobs.

This negative outlook toward mass participation was questioned strongly in the 1959 volume *The Politics of Mass Society*, by Berkeley sociologist William Kornhauser (1959/2008). Kornhauser radically reversed the Le Bon framework. He argued that individual and passive citizens normally feel isolated from the social order because they are powerless to bring about social change on their own. Their

participation in social movements, on the other hand, leads to a feeling of empowerment because it allows them to reach collective goals and to bring about social change. As such, social movements actually contribute to the social order by providing a mechanism for social innovation and social integration. Without social movements, citizens feel isolated and alienated from the social order. While some social movements might aim to overthrow the social order, other movements are aimed at implementing reforms that could ensure the long-term stability of society and bring the functioning of society in line with its professed value preferences.

The civil rights movement and the student uprisings of the 1960s, however, clearly forced political scientists to reconsider their view on social movements in a more profound manner as it became clear that these movements did not recruit just alienated members of society, and it became equally clear that these social movements would have profound political and social consequences. For the first time, academics themselves started to participate actively in these kinds of movements. It has to be noted in this respect that the writings of social historians such as Charles Tilly, E. P. Thompson, and E. J. Hobsbawm can be considered as pioneering contributions to this line of study, with an influence that was present in various scientific disciplines. In 1964, for example, Tilly published his seminal study on the counterrevolutionary uprising in the Vendée in 1793, explaining this movement by stressing the economic and structural strains the population of that region of France experienced. Other historians also arrived at the conclusion that uprisings no longer should be seen as just an emotional reaction, devoid of historical or political meaning, but that they actually could be interpreted as the result of a number of structural social changes. English historians stressed the moral indignation over economic injustice that gave rise to protest behavior in the 18th century. The writings of these social historians also had a profound influence on the way political scientists came to regard social movements.

Resources

A first and crucial innovation was the introduction of the *resource mobilization theory* by sociologists John McCarthy and Mayer Zald (1977). They argued that social movements are not just a spontaneous reaction to grievances and forms of discontent. Like all other forms of collective behavior, social movements are also dependent on a supply of material resources, such as time, money, pre-existing organizational structures, or organizational skills. This way of looking at social movements was heavily dependent on rational choice approaches to human behavior. The underlying idea was that participants in social movements do not take part just out of some frustration or discontent but that they will embark on participation only if they arrive at the conclusion that this investment (in time or energy or risk-taking behavior) can be considered worthwhile or will lead to some form of social or political

change. If organizational resources are not present at all, it does not make much sense to take part in contentious behavior. During the 1970s and 1980s, this resource mobilization theory was very influential in the study of social movements as it allowed scholars to investigate movements as a rational form of collective action. It also provided them with a checklist of items that were considered essential for the occurrence of forms of collective action. Organizational structures, means of communication, and preexisting recruitment networks were all considered necessary to mount a successful social movement organization. Critics, however, argued that this approach neglected the specific character of social movements, as the same rational approach could be applied to any form of political behavior. They also argued that various movements succeeded in bringing about social and political change in the absence of material resources.

Cultural Approaches

While the resource mobilization theory was very influential in the United States, it never became the dominant approach in European studies on social movements. Like their U.S. counterparts, European political scientists were surprised by the rise of the new social movements of the 1960s and 1970s, and they had to scramble to explain the phenomenon in a coherent manner. Most of them resorted to some form of *strain theory*: it was argued that rapid social change imposed strains on the functioning of society, and social movements were seen not just as a manifestation of those strains but also as a viable way to arrive at solutions for this kind of social pressure. Rapid industrial and population growth, for example, led to the occurrence of strains on the stability of natural ecosystems, and the newly emerging ecological movement not only focused attention on those strains but also developed possible solutions to arrive at a new environmental equilibrium. Social movements often were credited with playing a pioneering role because they succeeded in putting new challenges and new items on the political agenda. Within this approach, the term *new social movements* was used, in order to make a distinction between the classic social movements of the 19th century (e.g., trade unions) and the new social movements of the late 20th century (the women's movement, civil rights, ecology, etc.). New social movements were seen as a very typical phenomenon related to a specific developmental phase of highly industrialized societies. That is, the new social movements marked the transition from industrial to postindustrial societies.

The problem with this approach, however, was that it failed to explain the continuities in various forms of collective political action. Microstudies showed that the challenges (with regard to recruitment, mobilization, building political influence, etc.) facing new social movements were not all that different from the challenges that the social movements of the 19th century faced. Research also revealed continuities, such as between the women's suffrage movement of the

early 20th century and the feminist movements of the 1960s or between the nature conservation movement of the late 19th century and the modern ecological movement. Furthermore, the direct causal link between structural social change and the occurrence of new social movements failed to explain why some social movements were more successful in some countries than in others. If, for example, the green movement should be seen as a direct reaction to the degradation of the natural environment, one would expect this movement to be present—and successful in mobilizing—in all highly industrialized societies experiencing environmental degradation. This, however, was clearly not the case. Since the 1990s, in fact, quite a few of these new social movement organizations had entered into a phase of demobilization, so it became increasingly difficult for this line of research to attribute new social movements with a structural role in processes of social change.

Political Opportunities

One of the crucial questions in the comparative study of social movements is why these movements are successful in some countries and not in others, given the fact that grievances can be considered as universal. A seminal study by Doug McAdam (1982) started from the observation that the American civil rights movement started in the 1950s, at a moment when racial discrimination in American society actually started to decline. According to McAdam, the civil rights movement could prosper as a result of growing divisions within the ruling White elites. This meant that the civil rights movement had the opportunity to exploit those divisions as it gained access to elite allies that were instrumental in furthering the policy goals of the movement. The important lesson from this study is that social movements should not be seen as a direct reaction to grievances or specific problems within society, but that they can be seen as reactions to changes in the political system. Social movement organizations respond to the opportunities created by the system.

This *political opportunity structure* approach was later systematically ordered mainly in the work of the Swiss political scientist Hanspeter Kriesi and his research team (Kriesi, Koopmans, Duyvendak, & Giugni, 1995). The main idea of this approach is that the chances for success and mobilization of social movement organizations are strongly dependent on the opportunities created and offered by the political system. These opportunities can be institutionalized and formal (e.g., freedom of assembly, openness of procedures), but they can also be informal (e.g., cultures of pluralism or corporatism). Authorities or political elites can also try to facilitate or to repress social movement manifestations, and this will have an impact on a movement's chances for success. The political opportunity structure approach was successfully used in a number of comparative studies, demonstrating that the success of social movements in some countries was strongly dependent on features of the political systems in those countries.

Critics of the political opportunity structure approach argued that this way of looking at social movements limited the agency of these movements, as they were sometimes seen as a simple reaction to decisions being made by the political system. Proponents of the approach responded by introducing feedback loops into the model: Self-evidently, social movements can influence even basic characteristics of the political system (such as universal voting rights), so that social movement organizations in a later developmental phase will profit from the precedents created by earlier organizations.

Comprehensive Overview

What these three lines of theory building on social movements have in common is that they depart from a positive outlook on social movements and their effects on the political system. Participation in movements is seen as a rational act and a form of participation that is congruent with the prevalence of a democratic political culture. Other authors would even argue that social movements are necessary in order to bring about social change and a further democratization of contemporary societies. As a form of criticism, however, it has also been argued that each one of these theoretical perspectives offers a one-sided outlook on social movements. Self-evidently, material resources are important, but it is only if they can be used in an open political context, and if movements have access to a political and social culture that is conducive to their goals, that they will have an opportunity to succeed and to prosper and to have a profound impact on the political decision-making process.

An impressive effort to synthesize these approaches was published in 1996, when McAdam, McCarthy, and Zald tried to combine the insights from this research into political opportunities, mobilizing structures, and cultural frames. The guiding idea of this volume was that the various approaches had to be combined if one wanted to study the development of social movements in a comprehensive manner. Although this study has been very influential, one cannot state that it has led to a unification of the theoretical perspectives on social movements. Following all the elements that were brought forward in these approaches would amount to constructing a very long checklist of all conditions that are conducive to the success of social movement organizations, and this apparently was judged as not very practical. In reality, therefore, most of the researchers in this field continue to focus on either the material and organizational, or cultural, or political aspects of the functioning of social movements.

Empirical Research

It is difficult to develop a comprehensive account of currently available empirical research on social movements. Some studies focus on particular movements; others opt

for a comparative approach (across issues or across countries); still others focus on issues of recruitment, organization, framing of issues, or political consequences (Walder, 2009). This section focuses on a number of recent influential studies that take a lifestyle approach, starting from the origins of social movements to their political impact.

In the 1960s and 1970s, some authors were still looking for an objective assessment of grievances and social demands that could lead to the foundation of social movements. It was claimed that a sudden deterioration of living conditions (e.g., with regard to the environment, gender, or racial discrimination), or on the contrary a gradual improvement in experienced living conditions, would give rise to social movements. An important insight was that it was not the actual quality of life that had an impact on grievances but rather the difference between expected and perceived quality of life. In the 1980s, this *grievances approach* was gradually replaced by the *framing approach* to social movement demands (Benford & Snow, 2000). The guiding idea of this line of research is that social movements make claims about society and about ways that society should and can be changed. Collective action frames are successful if they succeed in mobilizing a sufficient number of participants and if they convey the message that change is indeed possible. Frames are more likely to be successful if they resonate with preexisting concepts within public opinion about how society is managed or should be managed. Studying claim-making activities as a form of framing reality implied in practice that researchers no longer tried to link the occurrence of social movements to real-life conditions.

Cultural frames, however, are not sufficient to start a successful social movement. One also needs participants. Research has shown repeatedly that individual participants are not recruited in an organizational void. On the contrary, participants are mainly recruited in preexisting networks or in various contexts (schools, work environments, neighborhoods, etc.) that are conducive to recruitment. This form of group recruitment can be explained partly by cultural mechanisms as it is likely that citizens who are active in the same kind of context will share at least some political preferences or ideological options. It also facilitates mobilization because it makes clear that mobilization can be successful. Taking part, which means investing time and energy, in collective action does not make sense if one has the feeling that only a very limited number of people will take part in the effort. Within a micromobilization context, however, actors can assess the likelihood that others will participate and can even try to convince others that participation is a viable option. These networks and mobilization contexts, therefore, allow for a more reliable assessment of the chances of success of the collective action effort (Diani & McAdam, 2003). The embeddedness in preexisting networks also diminishes the propensity to act as a *free rider*, that is, to profit from the efforts of social movement organizations without sharing the burden of investing time or money in these movements.

Research has also highlighted the fact that mobilization efforts have to overcome various barriers simultaneously. First of all, it is necessary to build a general social support for the goals and ideology of the social movement. The cultural frames espoused by the social movements have to be accepted as legitimate by at least part of public opinion. Subsequently, however, social movement organizations also have to ensure specific movement support: From those who agree with the basic ideas of a movement, participants have to be recruited who are able and willing to take part in specific actions. Participants' willingness to participate depends strongly on whether the participants think these actions can really contribute to achieving the general goal of the movement (Klandermans, 1997). Klandermans himself demonstrated the validity of this approach by a study on the peace movement: Although a vast majority of the general population would agree that peace is an important goal in society, a much more limited number actually took part in activities organized by peace movement organizations.

While resource mobilization theories emphasized the rational motives of social movement participants, in the more recent literature various authors have questioned this assumption by highlighting the emotional meaning of participation (Goodwin, Jasper, & Polletta, 2001). Participation in social movements often starts from indignation or rage about a lack of social justice, even if these pioneers cannot imagine that their actions will succeed. This kind of research highlights the fact that social movements are often pioneered by people who would not even think about taking initiatives if they were motivated solely by a rational calculation of costs and benefits.

Studies focusing on the form of social movements and organizations have recently come to pay attention to the geographical scale of activism. In the 19th century, social movements tended to occur mainly within the framework of the nation-state, but this is no longer the case. As various forms of political decision making have moved toward international organizations or ad hoc gatherings of world leaders, social movements have started to focus on *transnational activism*, uniting participants and social movement organizations from various countries (della Porta, Andretta, Mosca, & Reiter, 2006). The protest surrounding a meeting of the World Trade Organization in 1999 in Seattle, Washington, is often seen as the starting point of this kind of new transnational activism. Since that time, transnational activism has been strongly present on issues such as international trade agreements, sustainable development, greenhouse gas emissions, peace, and human rights. An innovating feature of transnational activism is the emergence of a social justice movement that aims to combine various topics, such as discrimination, human rights, and environmental degradation, into one comprehensive justice framework. International organizations, however, reacted swiftly to this new form of disruption, on one hand by allowing nongovernmental organizations to have a greater say in the preparation process of international gatherings,

but on the other hand by tightening security or by even relocating summit meetings to conference sites that are difficult for protesters to access. Although at the start of the 21st century, various authors expressed high hopes about the future of transnational activism, a decade after Seattle it seems that expectations have sobered. It has become clear that this kind of activism is difficult to sustain, even as new information and communication technologies have made it easier to mobilize participants across borders. Furthermore, transnational activism itself is plagued by strong forms of inequality, in that participants from industrialized countries have more resources to participate in this kind of activism than do participants from developing countries. Nevertheless, it can be observed that the presence of nongovernmental organizations and protesters has become a fixed feature of many international conferences, and some studies have even documented the impact of this kind of social movement activity with regard to human rights, social causes, international trade agreements, and the protection of ethnic minority rights, among others. Within transnational activism, some organizations stress the fact that political decision makers should be targeted (whether at the level of international organizations or at the level of the nation-state), whereas other organizations try to circumvent political institutions by promoting lifestyle behavioral changes or by trying to apply direct pressure to international corporations (e.g., on environmental norms or child labor).

Not just on an international level, it is clear that social movements have had, and still have, strong policy effects. During the past decades, political systems have implemented profound changes with regard to civil rights, equal opportunity, peace, sustainable development, and other issues that are being championed by social movements. It has been argued, therefore, that social movements clearly matter in the political process (Giugni, McAdam, & Tilly, 1999; Meyer, 2006). Indeed, some of the major processes of democratization in the 20th century have been implemented partly as a result of the demands of social movements. From an analytical point of view, however, it is difficult to assess whether these policy changes really can be attributed to the activities of social movements. Or to phrase it in a counterfactual manner, would political systems have adopted the same reforms in the absence of social movement activity? It is almost impossible to answer this kind of question in an unequivocal manner. It is crucial, however, that social movements in any case have had a strong agenda-setting effect, bringing to the front of the political agenda topics that were considered not politically relevant. Some studies have clearly demonstrated this agenda-setting effect, such as with regard to abortion rights and children's rights. There is less agreement, however, on the exact contribution of social movements to further phases in the policy cycle. Once an issue is accepted on the political agenda, the executive, the parliaments, and the political parties tend to take control of it, which renders it

more difficult for social movement organizations to try to influence its further development.

Some studies have also highlighted the fact that “political success” in the context of social movements is not an unequivocal concept. As the issues that have been brought forward by social movement organizations are integrated into the policy agenda, movement organizations may be seen as superfluous and may become caught in a downward mobilization spiral. Although some organizations might react to this form of policy success by a process of radicalization that leads to new demands on the political system, the mainstream effect is usually demobilization and/or institutionalization. For the women’s movement, for example, it has been argued that feminist groups may no longer be as active as they were in the 1960s and 1970s, but that they are becoming increasingly intertwined with the state bureaucracy, leading to the phenomenon of *state feminism* (Stetson & Mazur, 1995).

Furthermore, however, it has to be remembered that the impact of social movements does not remain limited to changes in legislation and policy. It has also been argued that social movement activity is associated with strong cultural change, such as with regard to more attention to the environment or biodiversity, or with stronger sensitivity to injustice, such as in race or gender relations. Some feel that the women’s movement in particular succeeded in bringing about important cultural changes, leading to stronger support for equal gender roles throughout society. Survey research makes clear that issues that were pioneered by the social movements of the 1960s are now accepted by a large part of public opinion in Western countries. Some research has even pointed to a totally different form of consequences of social movement activity. For the participants themselves, participating in social movements has profound biographical consequences, leading to a pattern of continued involvement and a strengthened sense of empowerment and efficacy. Even decades after their initial involvement, social movement participants are still characterized by significantly higher levels of participation, knowledge, and efficacy (McAdam, 1988). The impact of social movements goes even further in this respect, as participants’ activities allowed for the development of distinct social identities, based, for example, on a feminist identity or a homosexual or transgender identity.

Future Directions

Since the 1970s, social movement studies have grown into a fully mature subfield straddling the boundaries of sociology and political science. It is interesting to note that social movement studies have also established links with the disciplines of social psychology, communication, international relations, and gender studies. Social movement participation is now fully accepted as an integrative part of the political action repertoire of ordinary

citizens. Within the academy, social movement studies has become an accepted subfield, with numerous courses on social movements and two well-established journals. *Mobilization. An International Journal* (established in 1996) and *Social Movement Studies* (established in 2002) continue to publish state-of-the-art research on social movements. Whereas the former journal tends to emphasize U.S. studies, the latter is more strongly rooted in the European tradition.

From a theoretical perspective, too, it can be argued that social movement studies have become a fully established and consolidated area of study. The main theoretical approaches that were developed in the 1970s and 1980s are still clearly present in the current scholarly work, and although the original insights have been qualified to a large extent, it is difficult to pinpoint any major theoretical innovations that have occurred in the past decade.

It has been quite clearly documented that social movements tend to follow a *protest cycle*, with peak periods of mobilization, followed by longer periods of demobilization. Generally, the 1960s and 1970s are considered a very intensive mobilization period, but this kind of protest behavior seems less predominant in the early years of the 21st century. To cite but one example, the war starting in Iraq in 2003 led to some mobilization by peace movement organizations, but in no way can these protests be compared to the intensive mobilization against the Vietnam War in the 1960s and 1970s. For social movement scholars, the challenge is to demonstrate that their field remains theoretically and socially relevant, even in periods when mobilization remains at relatively low levels. This challenge has led, for example, to a call for a renewed link between social movement studies and social theory. Walder (2009) has argued that social movement studies have tended to focus too narrowly on the process of mobilization, thus limiting their focus on the structural social change that is considered conducive for the rise of social movements. According to Walder, a wider focus would allow social movement scholars to relate their work to basic theoretical questions of social order and social change.

In the absence of major theoretical innovations, the focus of current research projects (which should lead to some major publications in the years ahead) is rather to apply current insights to new places and movements. Leftist and progressive movements in western Europe and the United States have been well documented by now, but if the theoretical approach to social movements really is comprehensive, it should also apply to other organizations. First of all, the scope of organizations has widened. In recent years, a number of scholars have tried to apply the insights of social movement studies to movements that thus far did not receive all that much attention in the field. Conservative or right wing associations in principle should be confronted with the same problems of mobilization, framing, and gaining access to the political decision-making

process. Although a number of studies on extreme right activism are available, however, it still remains to be investigated whether the framework that has been developed for social movements in general can also be successfully applied to this kind of social movement organizations.

Second, there has been a tendency to expand into the domain of political parties and other forms of political involvement. Political parties increasingly experience difficulties in mobilizing new members and in activating their existing members. Parties too are typically confronted with the organizational dilemma that it is extremely difficult to develop an internal organization that is coherent with their ideology. Whereas in the 1970s and 1980s, social movement participation was still seen as an innovating feature of the political action repertoire of citizens, this is no longer the case. New forms of participation have now come to the front, posing a new challenge to the theoretical study of participation behavior. Internet-mediated forms of participation, emotionally driven protest activities, transnational activism, symbolic challenges, and “spontaneous” or instantaneous forms of participation still need further investigation, and it has to be assessed whether these new forms of participation would have the same dynamics as social movement participation. Although it is clear that these new forms of protest succeed in mobilizing a large number of people, we do not know yet how successful they will be in exerting political influence, or in making sure their issues lead to a real policy output. This kind of initiative is often characterized by a rejection of traditional and hierarchical organizations, preferring more loose-knit networks or other egalitarian ways of organizing. This preference, however, could also make it more difficult to obtain real political leverage.

These new forms of participation clearly pose a challenge for mainstream social movement theory. This theory is focused rather strongly on the role of social movement organizations, and all these new developments could actually lead to a reduction of the role of organizations in the mobilization process. If protesters get mobilized by mass media or new communication technologies, the central role of organization is less evident. It remains to be investigated, however, whether challenges to the political system can be sustained in the absence of a solid organizational structure. Mass media might be very effective in mobilizing large numbers of people, yet it is also well-known that media tend to lose attention for issues after a limited time, moving on to the next issue at hand. Also, with regard to the biographical consequences of activism, we do not know whether socialization effects of involvement are just as strong in the absence of organized movements. Theda Skocpol (2003), for example, has expressed concern that social movement organizations are increasingly becoming professionalized. They no longer rely on the routine participation of a huge membership base but are increasingly being run by professionals who are paid by contributions of members. The involvement of most

members will remain limited to paying dues and occasionally reading a newsletter or taking part in a professionally organized activity. The democratic idea of grassroots involvement in policy-making processes therefore seems more and more out of reach.

Third, recent studies have also witnessed a growing geographic spread of the movements under consideration. Already in the 1980s some studies had appeared on social movements in the (then still authoritarian) countries of Central and Eastern Europe, but more recently studies have addressed social movements in Latin American, Egypt, Iran, and China. These studies have forced us to examine whether the concepts that were developed for liberal industrialized societies can be applied meaningfully to other kinds of society. They have also led to new challenges for empirical research because this kind of research entails new risks, both for researchers and for respondents in the research.

It could be argued that social movement studies are less innovating in the current development phase than they were 20 or 30 years ago. Simultaneously, however, there can be little doubt that social movement studies will remain an integral part of sociology and political science. On one hand, they allow political science to connect to the theoretical debate about major changes with regard to the social and political structure of society. Issues such as global justice, gender equality, environmental degradation, and sustainable development have received increasing attention in political decision making, and it can be argued that social movements at least have been instrumental in bringing about this change. For political science, too, social movement studies have created an opportunity to keep in touch with these social and cultural changes.

Second, however, it is now taken for granted that full political participation is a hallmark of any well-functioning democracy. This kind of participation is no longer limited to electoral participation but encompasses various forms of participation, and participation in social movement organization is clearly one of them.

Conclusion

Social movement studies can be considered an important subfield within political science. They almost inevitably depart from a view of society in which social conflicts are seen as an integral part of the social structure. Movements also allow for a further democratization of society, enabling grassroots activism, and they are instrumental in bringing new topics onto the political agenda. Social movement theory has highlighted the role of resources and cultural and political conditions for the success of social movement organizations. The most recent decade has been characterized by efforts to integrate and consolidate these theoretical approaches. It seems clear that social movement activity in the current age is lower than it was in the heyday of the 1960s and 1970s, and the main challenge for

social movement theory is to demonstrate that this subfield remains relevant for “mainstream” political science in periods of reduced social movement activity.

GENDER AND POLITICS

KAREN J. VOGEL

Hamline University

In 1976, Peter Merkl observed that the field of comparative politics had been woefully deficient with respect to the study of women (Merkl, 1976). Few comparative studies on gender existed, almost no presentations or panels appeared at professional meetings, and no academic journal specialized in the publication of research in the subfield. More than 40 years later, the study of women, and more broadly gender, in comparative politics has flourished, becoming an important area of research. A recent issue of *Perspectives on Politics* dedicated a whole section of the journal to a review of comparative politics of gender. This chapter is intended as an overview for students who wish to gain a general understanding of the evolution of this field of study.

Several aspects of the study of women in comparative politics are summarized in this chapter. The first section highlights how the comparative study of women and politics has evolved since the 1970s, noting an increase in the number of scholars in the field and the acceptance of this area of research into mainstream political science journals. The second section examines some of the key themes and theories, including women and representation and feminist comparative public policy. The growth of studies on gender regimes and the welfare state, state feminism, the formation and implementation of women-friendly policies, and the influence of women's movements on policy debates are presented. Next, some practical implications of these studies are noted, followed

by a discussion of future directions of research. Finally, the chapter concludes with a brief summary, a short list of related chapters in this handbook, and a list of references and readings for further study.

Evolution of the Study of Women and Comparative Politics and Strategies for Research

Comparative political science has been around since the time of Aristotle. In its modern configuration, the subfield has been defined as involving both a comparative method of study and a substantive area focus on understanding the societies and politics of countries and regions of the world (Hull, 1999). In its early stages, comparative politics took a more formal-legalistic approach, using historical analysis or descriptive studies of political institutions and governments primarily in Western Europe and the United States. However, with the growth of behavioral perspectives and critiques in the 1950s and 1960s, comparative studies moved toward more empirical methods and theory building (Hull, 1999). Comparative studies of political behavior, political culture, democratization, development, public policy, and the state became more common and more global, with no single theoretical paradigm dominating the field (Hull, 1999).

Even with these expansions in themes and methods, women were still remarkably absent, both as a subject of study and as practitioners in the field early on (Gruberg, 1999). Part of the reason was that gender was considered at the time to be a “marginal” or unimportant area for comparative political study. Since so few women were in key positions of political leadership around the world, the notion of women having power or political influence was perceived as irrelevant. Even the notion of gendered policy making was not considered, much less fully articulated or well developed, in comparative perspective. Furthermore, women entering political science were counseled to be careful to do “mainstream” work in order to be successful in the completion of a dissertation or accepted in the job market. Very little incentive existed for opening up new areas of research related to women and comparative public policy or political representation, or gender and politics more broadly (Hull, 1999).

By the late 1970s, this began to change as political science, and comparative politics in particular, was impacted by feminist critiques and increased numbers of women in the discipline (see also Chapter 41, titled “Feminist International Relations,” in this handbook). Changes within the American Political Science Association itself, the role of key conferences in providing the impetus for research, and the creation of new academic journals all helped the study of women and comparative politics to become accepted in the discipline.

For example, the seminal conference “Social and Political Change: The Role of Women” held at the University of California, Santa Barbara, in 1974 called attention to the need to incorporate women into political and social studies (Merkl, 1976). The formation of the Women’s Caucus for Political Science in 1969 provided mentoring and support for women entering all subfields of political science. And finally, the creation of several key academic journals, including *Signs* in 1975, *Women and Politics* in 1980 (known since 2004 as *Women, Politics, and Public Policy*), and most recently *Politics and Gender* in 2005, all fostered interest in research on women and politics. By the late 1990s, mainstream journals such as *Comparative Politics*, *Comparative Political Studies*, *PS: Political Science and Politics*, and *Perspectives in Political Science* all were publishing articles in which women were central in the analysis of various comparative topics. By the 21st century, research on women and comparative politics was much more widespread and acknowledged in political science than previously reported by studies of the discipline at the end of the 1990s (Gruberg, 1999; Hull, 1999).

Over time, multiple methodological and theoretical debates also emerged. Much like the debates in political science as a whole, the debates surrounding the comparative study of women and politics, and more recently gender and comparative politics, have focused on whether to do large cross-national, quantitative studies or to employ smaller, detailed case studies (Mazur & Perry, 1998). The

advantage of small qualitative studies is their ability to capture the complexities of cultural contexts and the interplay of race, class, and gender issues. The obvious disadvantages are the inability to generalize about cross-national patterns or to replicate particular research findings over time. On the other hand, larger, quantitative studies using data sets can offer more generalization but miss the nuances of difference that can be key in understanding the impact of identity and gender issues in particular.

Since the late 1990s, some scholars have chosen “not to choose,” that is, to try to find some combination of qualitative and quantitative methodologies such as those created by the Research Network on Gender Politics and the State (RNGS; Mazur & Perry, 1998). This network brings together more than 46 scholars to study and explore theories about gender, policy making, and state processes. Publishing a variety of books and articles over the past 10 years, these scholars have addressed some of the thorny problems of depth versus generalizability by using a combination of detailed interviews, data collection from numerous sources, numerous case studies, and more in empirical research.

Themes, Theories, and Approaches of Comparative Research on Women and Politics

Since the advent of comparative research on women and politics, several areas of inquiry have emerged, only a few of which will be discussed here. These include studies of women and political representation and feminist comparative policy, analyses of gender regimes and the welfare state, state feminism, policy formation and implementation, and the impact of women’s movements. Although women, or more broadly gender, have been commonly used as a variable rather than an analytical tool, more recent theoretical work in comparative research, overlapping with feminist international relations and women’s studies, has started to examine the possible gendered nature of policy, bureaucracies, and the state (see also Beckwith, 2010).

Women and Political Representation

The earliest comparative studies of women and politics focused first on issues of female representation in industrialized countries or the states of Western Europe, Canada, and the United States. Researchers were primarily interested in whether women were elected to key political positions and what circumstances tended to favor the access of women to political office. Formal politics, such as voting, elections, the role of political parties, and work of legislators were at the heart of these studies, with later work considering the role of women in civil society. Early classic works in these areas were *Politics and Sexual Equality: The*

Comparative Position of Women in Western Democracies (Norris, 1987), *Gender and Political Parties* (Norris & Lovenduski, 1993), and *Women and Politics Worldwide* (Nelson & Chowdhury, 1994).

In the past 15 years, studies on representation became more complex, focusing on what combination of factors contributed to a lesser or greater degree to the legislative representation of women. Political or institutional, cultural, and socioeconomic explanations also emerged as possibilities for investigation. Research also gradually moved beyond industrialized states to central and eastern Europe, Latin America, Asia, and Africa (see Kenworthy & Malami, 1999).

For example, institutional explanations looked at the nature of the electoral system itself, the construction and size of political parties and party candidate lists, the timing of women's access to the vote, and levels of democracy. Although some studies disagreed, generally proportional representation (PR) in parliaments was viewed as more favorable than district-based systems as the number of seats available to women in PR systems tended to be higher (Matland & Studlar, 1996). Political parties with open party lists and term limits were also seen as favoring the advancement of women (Htun & Jones, 2002; Krook, 2005). And overall, the quality of democracy—that is, systems with multiple, competitive political parties, high voter turnout, and regular elections—also increased the representation of women (Lindberg, 2004; see also Viterna, Fallon, & Beckfield, 2008).

A second area of interest focused on religious or cultural factors in determining levels of representation of women. Initial studies on cultural or religious factors ranged from examining the effects of Muslim or Catholic cultures in hindering women's election to political office to studying aggregated attitudes toward gender equality (Tripp & Kang, 2008). Some research attempted to use binary variables measuring whether a state ratified the United Nations (UN) Convention on the Elimination of Discrimination Against Women to examine attitudes about women's equality and the connection between these attitudes and women's representation (Tripp & Kang, 2008). More recent studies, including those by Inglehart and Norris (2003), have largely used data sets such as the World Values Survey, with information from more than 70 countries, finding that well-educated, less religious, and single respondents in postindustrial states were most likely to support equal representation for women.

Pursuing a third area of interest, scholars have explored socioeconomic factors affecting women's representation, in particular women's levels of education and participation in the labor force. These studies have yielded mixed results. Paxton (1997), for example, found that levels of education or numbers of women in the workplace are not as important as institutional factors that may limit women's access to political processes. On the other hand, Kenworthy and Malami (1999) discovered that the type of

professional occupation indeed might enhance women's participation. More recent research has returned to the question of whether development impacts women's representation. Viterna, Fallon, and Beckfield (2008) have argued that in order to have a better understanding of this relationship, taking into account different political systems and economic circumstances, studies must examine developed and developing countries separately. Levels of democracy may still be important, but economic development does matter.

In the past 6 years, researchers also explored the impact of quotas and to what degree they enhance women's representation around the world. These studies call into question earlier institutional, cultural, or socioeconomic explanatory variables (Tripp & Kang, 2008). Quotas refer to a prescribed number of seats in parliament, on political party lists, or in political leadership allocated to women within a political system. Quotas can be mandated informally through party practice or tradition, or more formally through legislative rules, constitutional amendments, and the like. Recent books on the impact and effectiveness of quotas include *Representing Women? Female Legislators in West European Parliaments* (Diez, 2005) and *Women, Quotas, and Politics* (Dahlerup, 2006). Articles on the subject have also appeared in several journals, including most recently a comprehensive study on the global impact of quotas by Tripp and Kang (2008) and work on quotas in Latin America by Jones (2009), both in *Comparative Political Studies*.

Tripp and Kang's (2008) study is particularly instructive in pointing to the impact of quotas vis-à-vis previous understanding of female representation. The nature of the electoral system, specifically in terms of proportional representation or levels of democracy, was earlier considered most important in determining the level of representation of women. However, the introduction of quotas in a variety of systems, democratic or not, has shown that although PR systems may still be important in some parts of the world, the existence of quotas, regardless of the type of regime, may be even more critical.

Quotas also seem to matter more than religious or cultural factors as many predominantly Muslim countries have adopted quotas for women, raising their representation in the political process. This phenomenon contradicts earlier research pointing to the restrictive nature of religions such as Islam or Catholicism on women's political rights. Furthermore, the existence of quotas may also be more important than the length of time women have had the vote in a particular country or the country's degree of economic development. Quotas, according to Tripp and Kang (2008), seem to have helped women overcome limitations traditionally created by economic underdevelopment, authoritarian regimes, cultural contexts, or the features of regular electoral politics, thus challenging previous notions of whether political, cultural, or economic factors are most important in understanding the evolution of women's representation.

What is more uncertain is whether quotas create a permanent avenue for representation of women and greater impact in the policy-making process. As Tripp and Kang (2008) admitted, more longitudinal studies including future data on women's representation and effectiveness in the political process are needed to learn whether quotas are indeed the key to ensuring political equality for women. Further work is also needed on understanding which women are privileged in the quota selection process. In other words, to what degree do race, class, and gender, or issues of *intersectionality* and *positionality*, matter? Additionally, more comparative work on women's representation in developing areas, especially Africa, would be helpful in understanding the possibilities for social change.

Feminist Comparative Policy

Along with women and representation, a key area of research is the study of feminist comparative policy. This research has coincided with the emergence of various new social policies, ranging from equal job opportunities, shared part-time work, welfare programs, and parental leave to policies dealing with reproductive rights, sexual harassment, and violence against women in states globally. Feminist comparative policy research is interested in understanding the similarities and differences in the formation, implementation, and effects of these policies on women, and the area is moving from studies at the state level to examinations of the impact of policies of transnational organizations such as the European Union or the UN (Gottfried & Reese, 2003). The underlying hope of researchers here is that scholars and practitioners worldwide can learn from each other what policies pragmatically solve public problems and better the lives of both men and women.

In the 1990s and early 21st century, much of this work focused on the West or women in the industrialized states. Ackelsberg (1992) found that several authors made contributions, including Gelb and Palley (1987), Sassoon (1987), and Boneparth and Stoper (1988). They explored how policies can affect men and women differently as well as to what degree women impact the policy-making process. This work raised important questions, such as: Who benefits and who does not when public problems are defined a certain way? Can women who are often marginalized or lack accessibility to decision makers affect policy? And how are inequalities reinforced, changed, or redefined by policy reform?

By the 21st century, the RNGS group, among others, began making major contributions to this research, expanding the topics and theoretical issues pursued (Mazur, 2002). Gottfried and Reese (2003) found in their comprehensive review of feminist comparative policy research at least four categories or aspects of policy study that have appeared recently in the literature. These include gender regimes, policy, and the welfare state; the emergence of state feminism and its effects; the process of women-friendly policy

formation and the challenges of policy implementation; and the role of women's movements in shaping social policy debates. Some of the themes and findings in each of these areas are discussed next.

Gender, Policy, and the Welfare State

Since the 1990s, scholars in women's studies, sociology, and political science have all been interested in trying to understand how gender is constructed in the politics of the welfare state. This work first moved toward reframing old welfare state typologies and theories into more gender-sensitive models, and then sought new ways of examining questions related to concepts of the nature of families, work, social care, and the state (Gottfried & Reese, 2003). Key to this work have been the contributions of Walby (1999), who examined the nature of gender regimes, Acker (2006), who introduced the concept of inequality regimes, and Lewis (1992), who elaborated on the concept and role of the male breadwinner model in social policy.

Gender regimes refer to systems or patterns of gender equality or inequality in gender relations found in the household, the market, civil society, and the state. Walby (1999) was interested in how gender regimes in industrialized states move from private (within the family or the personal) to public domains (economics, civil society, policy, and government). She argued that four aspects were important in understanding gender regimes and the possibility for these transitions: (1) Gender regimes were social systems or gender orders coexisting with differing degrees of inequality or equality; (2) such regimes can be differentiated in a variety of ways along market, regulatory, or socially driven dimensions; (3) a number of public domains can exist where gender regimes operate simultaneously; and (4) gender regimes can also be created as a series of gendered social activities and traditions, constructed, reconstructed, and reinforced from one generation to the next. Gender regimes do not have to be static and can change over time.

Acker (2006), a sociologist, took these ideas a step further and posited the notion of *inequality regimes* as an analytical approach to explain the creation and maintenance of inequalities in work organizations. Drawing on the concepts of intersectionality and the mutual and reinforcing reproduction of class, race, and gender relations of inequality (see O'Loughlin, Converse, & Hoeschst, 1998), she set the stage for the possibilities of detailed and complex comparisons of inequality, identity, and power relations in a variety of forms within the welfare state and beyond.

Lewis (1992) focused on another aspect of gendered policy making by exploring the importance of the *male breadwinner model*. This model contains several assumptions about the role of men in the family and the household, including the idea that men are the primary providers. Lewis, and later Orloff (2002), found that this model has often permeated assumptions of policymakers and gendered the creation of social policy across industrialized

states. Women become caught in situations in which welfare benefits or labor policies are determined by gendered assumptions that do not apply to the realities of their day-to-day lives. And even though the breadwinner model has waned or shifted with societal changes in different countries, it still carries a great deal of political power (Orloff, 2002).

Armed with these theoretical frameworks, scholars in feminist comparative policy have examined public policies related to job training, employment, education, paid work, welfare, and many other areas. They have also investigated the institutional arrangements and political contexts that have fostered these policies. While the focus has generally been on case studies of industrialized states, recent research has started to explore labor and welfare policies and institutions in central and eastern Europe, Asia, and Latin America (Pribble, 2005).

One of the interesting findings in much of this work is that social, political, and economic changes, or the move from private to public gender regimes, are not always matched by new definitions of gender roles or greater economic, social, or political equality for women (see Pascall & Lewis, 2004). As will be discussed later, only when active women's movements, creating fundamental shifts in perceptions and calling attention to equal treatment, are present do policies seem to be implemented and more likely to change conditions of inequality (Gottfried & Reese, 2003; Katzenstein & Mueller, 1987; Keiser, 1997; Montoya, 2004; Sainsbury, 1999).

State Feminism

Another important area of comparative research on women and politics is the study of state feminism. *State feminism* refers to the emergence, within governments, of women's policy machineries created to handle the advancement of women or women's policy issues. These machineries can take many different forms, such as formal ministries, offices within a particular department of the state, or special formal commissions or committees created by the parliament or legislature. According to the UN Commission on the Status of Women, women's policy machineries are any formal entity recognized and supported by the state as dealing with the promotion of equality for women. They usually are central, policy-coordinating units (see, e.g., the following UN document related to the Commission on the Status of Women: E/CN.6/1988/3; see also E/CN.6/2009/15). By 2009, two thirds of the world's states had created women's policy agencies and continued to play an important role in articulating issues related to women and girls (see, e.g., the following UN document related to the Commission on the Status of Women: E/CN.6/2009/15).

Feminist comparative research has used a variety of strategies in examining state feminism (Squires & Kantola, 2008). Approaches have included single-country case studies, multiple case comparisons selecting most similar

cases, and comparisons of case studies considered to be most different. Recent studies have moved from industrialized states to developing countries. Regardless of the number of policy cases or types of states, researchers have generally been interested in whether these machineries have an impact on women-friendly policy formation and are effective in improving the lives of women. Success might be measured in terms of whether women or advocacy groups were actually brought into critical policy-making processes and whether a redefinition of policy goals and practices occurred that addressed feminist goals of equality (Squires & Kantola, 2008).

Academic studies done by the RNGS group, as well as research initiated by the UN Division for the Advancement of Women and the UN Commission on the Status of Women, have produced a complicated picture of the impact of women's policy machineries in various regions of the world. For example, Mazur (2002) acknowledged the role of *femocrats* (a term coined by Australian feminists to describe the professional female workers in policy offices who supported gender equality agendas) in bringing feminist issues into the public discourse and the realm of formal politics. Weldon (2002) later explored the possibilities of a continuum of government responsiveness, arguing that the existence of women's agencies did not necessarily mean that they were always effective.

More recently, Outshoorn and Kantola (2007) have asked why, almost a decade after the proliferation of women's policy machineries, more progress has not been made on the achievement of equality for women. They found that often *gender mainstreaming* efforts triggered the creation of a single women's agency but at the expense of more widespread policy initiatives and funding for programs across government departments. The slowing of policy implementation also may have been caused by a need for expertise that was hard to find or by difficulty in addressing the needs of the multiple identities of women and their experiences. Furthermore, the larger economic situation and specific tensions between feminist policy goals and neoliberal market agendas collided in such a way that parties of the political right would attempt to reduce or to hold the line on costs of new social programs promoted by these agencies.

Recent work by the Division for the Advancement of Women, under the auspices of the UN Commission on the Status of Women, has also acknowledged that women's agencies must address a wide variety of issues and be supported financially and politically by governments if they are to be more effective. Recently, special attention has been given to the role these agencies may play in the fight against HIV/AIDS and the need to enhance their capacities to address education, prevention, and health issues. However, the UN itself acknowledges that without appropriate staffing, levels of financial support, and political will on the part of states, these tasks will be difficult (see, e.g., the UN document related to the Commission on the Status of Women: E/CN.6/2009/15).

Nearly all these studies agree that the success of women's policy machineries depends more on external factors than on the internal features of the bureaucracies themselves (Squires & Kantola, 2008). In other words, the general economic, social, and political environment, as well as the nature and strength of women's mobilization, matter in the sustaining of these agencies and their effectiveness. State feminism, and its ability to formulate or to implement policy, arguably is susceptible to how visible, vocal, and influential women's movements might be and whatever shifts or changes might be occurring within a country or region.

Policy Formation and Implementation

Related to the study of state feminism is an interest in policy itself and understanding the similarities and differences of policy formation and implementation cross-nationally. Along with the work of the RINGS group, several institutes and organizations have appeared in the past 30 years to extend the comparative research on women and policy. Among the most active and well-known groups are the Institute for Women's Policy Research, which works in affiliation with the George Washington University; the Center for Women Policy Studies, a nonprofit based in Washington, D.C.; and the Institute for Research on Women, located at Rutgers University. Although the work of these groups has often focused on internal policy making and implementation in the United States or Europe, interest has increased in the formation and implementation of policy for the advancement of women in developing countries as well. Many of these institutes have sponsored recent symposia, research projects, and special conferences related to the study of women and politics in Latin America, Asia, and Africa.

Scholars associated with these groups have published numerous studies using case studies, cross-national statistical analyses, or both, and have drawn a variety of conclusions. As early as 1997, Keiser found that legislation of a policy does not guarantee implementation or enforcement. Using child support policies as a case in point, Keiser noted that only where women have a strong political base and can push for accountability can policies achieve appropriate levels of enforcement (Keiser, 1997).

In their review of workplace policy research, Gottfried and Reese (2003) found multiple causal factors in effective policy formation and implementation. In particular, rates of women's unionization, types of legal systems, modernization of gender regimes, changing social and political divisions of power and authority, economic markets, and the pressures of transnational feminist networks—to name just a few—could all impact policy debates and actions to varying degrees. Gottfried and Reese also noted that further research needed to be done to clarify the role of policy recommendations and guidelines promoted by the UN and the European Union in enhancing the strength of policy implementation.

In 2004, Montoya asked theoretical questions about what makes some policies harder to implement than others and called for more complex models of research for understanding policy formation and implementation. Starting with the acknowledgment of societal values, she built a two-dimensional model focusing on various types of mechanisms needed for policy formation and the potential strategies and resources required for women's rights advocates to act and to interact with their political environments to ensure policy implementation. Focusing on the Italian experience as a case study, she concluded that depending on the policy issue, policy advocates both inside and outside government, with the potential for alliances and coordinated efforts, can affect policy outcomes.

In 2006, Hannan took up the challenge of assessing some of the broad implications and outcomes of the frameworks and recommendations for gender policy promoted by the UN Platform for Action from the Beijing Conference. She found that whereas numerous women's agencies and national policies had been created for the advancement of women and girls, the results were indeed quite mixed. Disturbing gaps continued between policy intent and policy outcomes. No matter whether it was health care, education, or the reduction of violence against women, progress was very uneven from state to state and region to region. Discrimination and public attitudes had not necessarily changed or improved at the same rate as reform efforts in legal or policy frameworks (Hannan, 2006).

Current research explores not only types of policies and their outcomes but also the importance of distilling issues related to the influence of women's movements, feminist activism, and gender issues more broadly defined. For example, Chappell (2007) has called for a shift from an agenda of comparative research on women and politics to an understanding of the role of gender norms and gendered institutions in policy making. In March 2010, Beckwith reviewed the logics of a comparative politics of gender, briefly enumerating the benefits of a comparative study of gendered analysis of political phenomena (Beckwith, 2010). This research has led to work on gender and courts, as well as opening up the possibility for studying both men's and women's positions in political structures at all government levels and in policy discourses.

Women's Movements

Since the groundbreaking work of Katzenstein and Mueller in 1987 on consciousness, political opportunity, and policy making, scholars have explored the variety of ways that feminist goals and practices connect to policy, the state, and other political structures (Katzenstein & Mueller, 1987). While Mazur (2002) cautioned that the role of women's movements is not always clear-cut, most feminist comparative studies have agreed that some level of women's mobilization, through either autonomous

movements or larger formal organizations such as unions and political parties, has been key in the formation and effectiveness of women-friendly policies in Europe and Latin America (DiMarco, 2008; Kahn & Meehan, 1992).

Recent literature has continued to pose complex questions surrounding the evolution and role of women's movements in civil society in different cultural contexts. Some of this scholarship has also explored the strength or viability of cooperation among local women's nongovernmental organizations and global networks in influencing gender policy. For instance, Orr (2008) found that in some east European states, ethnic and regional divisions limited the ability of women's organizations to work together on issues related to equality. Comparative scholarship on women and politics in the Middle East pointed to positive relationships between transnational women's networks and global rights agendas promoted by the UN and women's movements, as well as the important role women have had in shaping civil society (Moghadam & Sadiqi, 2006).

Research shows that women's activism does not necessarily reproduce Western gender frameworks but involves pragmatic and context-specific strategies that are still responsive to global trends promoting the advancement of women (Moghadam & Sadiqi, 2006). Although more studies need to be done regarding trends in Africa, early work suggests that here, too, cultural context matters and that strategies to improve women's lives may not depend only on influencing formal structures of political systems but rather on the creation of local and communal women's organizations and networks (Goetz & Hassim, 2003; Lindberg, 2004).

Practical Implications

Practical implications for policy development and research can be drawn from the work on women and comparative politics over the past several decades. First and foremost, context matters; policies formed in the United States on pay equity and parental leave, for example, may not work or even be appropriate for countries in Asia or the Middle East, because of differing histories, cultures, economic systems, gender regimes, and political structures. Even though scholars and practitioners have much to learn from each other, importing gender policies from one country to the next should be considered with great caution and understanding that circumstances and conditions can differ from state to state.

At the same time, that wisdom does not mean that general guidelines on the equal treatment of women should not be discussed or that general theorizing and empirical research should be abandoned. The creation of universal policies for all may not be possible, but international bodies such as the UN, the European Union, the African Union, and other transnational networks have roles to play in drawing attention to the condition of women worldwide and providing recommendations, support, and

possible strategies for improvement where appropriate. Furthermore, the comparative study of similarities and differences in policy making can provide insights for policymakers within states, as well as point to broad patterns and themes cross-nationally. Placing gender at the center of these studies can also improve understandings of politics and political behavior generally.

The use of quotas as a practical solution for increasing women's representation in political systems is also important to note. Although further research should be done on the longevity and real influences on political processes overall, comparative research so far seems to suggest that this type of institutional reform may work at least partially to break old patriarchal norms and provide more representation to women in some contexts.

Future Directions

The study of women and comparative politics continues to be one of the dynamic areas within political science, with much research yet to be done. Only a few future directions can be suggested here. First, it is clear that more work is needed on the representation, political influences, and policy processes of women in developing countries. A paucity of research exists on women and Africa in particular. So far, most studies have focused on South Africa or Uganda, and few have gone beyond discussing issues of representation and policy formation (see Goetz & Hassim, 2003; Lindberg, 2004). Additional research on a wider variety of countries and policies would improve the understanding of diverse historical, cultural, social, economic, and political factors in the region, as well as gender activism and policy reform from state to state.

As already discussed, continued research is needed on quotas as a practical solution for the advancement of women in politics. What is the long-term impact of quotas? Does election through quotas affect the perceptions of women by their peers? Are they viewed as equally qualified, or does the quota selection process tend to color their acceptance by fellow legislators, inhibiting their performance as policymakers? What happens after quota systems are lifted? And does the existence of quotas in party lists, parliaments, or other political bodies have any spillover effect in the direction of other policies related to equal treatment either for women or for other marginalized groups? And do race and class among women also matter in who is elected through quotas? These questions might be very interesting to explore in a variety of cultural contexts.

Additional work on the process of policy transfer through international organizations like the African Union, the European Union, or the UN would also be useful. As yet, the academic literature has only started to explore to what extent states take these recommendations seriously and whether such policy recommendations are effective in improving women's lives. With respect to policy outcomes

as well as issues of representation and quotas, more longitudinal research is needed to understand the longer term impact of strategies, programs, and agendas for the advancement of women.

Shifts to focusing on gender more broadly in comparative studies also open up the possibilities for more work on lesbian, gay, bisexual, and transgender issues and public policy. To date, some comparative work has been done on politics and policies related to homosexuality and gay rights in Canada and the United States (Smith, 2008). However, considerably more research is needed to understand gender dynamics, political mobilization, and possible new directions for policy creation, reform, and implementation in this area in other countries around the world.

Conclusion

This chapter has traced the evolution of the study of women and comparative politics from the later 1970s to the present. Using methodologies common to political science, comparative research on women and politics has moved from topics focused on representation of women in various governments around the world to the study of feminist comparative policy. Over time, theoretical frames have incorporated intersectionality, gender regimes, and interests in gender as an analytical category, especially with respect to the state and policy-making practices.

Practical implications for research include the recognition that historical, cultural, social, and political contexts matter in understanding policy formation and implementation. Case studies are vital in gaining these insights, and yet cross-national studies are still important in efforts to understand broad patterns and relationships of representation. Future directions for research include the need for more comparative work on women and politics in developing countries, especially Africa, and the topic of comparative public policy and sexual diversity. It is hoped that this chapter prompts students to consider doing research of their own in this dynamic area of political science.

COMPARATIVE ENVIRONMENTAL POLITICS AND CONFLICT

AMANDA M. ROSEN

Webster University

Since the last years of the cold war, the study of security and conflict has moved forward from traditional interstate wars to consider issues of *human security*. Ullman (1983) was one of the first to call for the field of security studies to include nontraditional forms of conflict, and other scholars (Kaplan, 1994; Matthews, 1989) soon followed, noting in particular the role that environmental issues could play in creating and exacerbating conflict between states.

Connections between environmental scarcity and conflict date to the original work of Thomas Malthus (1798), who predicted that the difference in the rate of growth in population and food supply would eventually lead to Earth's population overtaking the food supply. Choucri and North (1975) argue that rising population creates an increased demand on limited resources, which in turn causes "lateral pressure" that leads countries to seek resources outside their borders via conquest. However, the field of environment and conflict really took hold in 1991 with the publication of Thomas Homer-Dixon's article titled "On the Threshold: Environmental Changes as Causes of Acute Conflict" in the journal *International Security*. This article laid the groundwork for new thinking about how environmental scarcity can lead to social changes that in turn create breeding grounds for intra- and interstate conflict.

This chapter examines the foundational ideas of Homer-Dixon and his colleagues at the University of Toronto, dubbed the *Toronto Group*; the additions and critiques offered by other scholars in the field; the empirical evidence for and against the Toronto Group's hypotheses; the policy implications of the argument; and the future directions of research in environment and conflict.

Theory

There are numerous environmental challenges that can create incentives for conflict. Issues such as climate change, deforestation, depletion of fish stocks, water pollution, ozone layer depletion, and degradation of agricultural land present clear challenges to policymakers interested in avoiding conflict. For centuries, human settlement patterns have followed the path of natural resources and their ability to provide food, water, and shelter. Changes to these environments can therefore disrupt established social patterns and lead to conflicts between groups and states. Essentially, environmental scarcity puts pressure on existing social processes, resulting in decreased agricultural production, economic decline, population displacement, and disruption of normal patterns of social relations. This potentially

leads to conflict between states and societies (Homer-Dixon, 1991).

Environmental Scarcity

Homer-Dixon (1998) defines *environmental scarcity* as “scarcity of renewable resources such as cropland, forests, river water, and fish stocks” (p. 8). There are three types of environmental stress or scarcity. *Supply* scarcity results when an existing resource is depleted, such as when deforestation reduces the availability of lumber for fuel and shelter. Demand for the resource remains the same, but there is less of it to go around. The second type is *demand* scarcity. This occurs when the resource stock remains static, but the population relying on the resource increases, through either higher levels of growth or migration. Supply of the resource remains the same, but it must be split into smaller pieces to accommodate everyone. The third type of scarcity results when the *distribution* of the resource is not equal. Supply or demand may remain unchanged, but groups may have unequal access to the resource, creating a system of haves and have-nots.

Environmental scarcity can result from several different factors. Changes in the environment can lead to degradation of an existing resource. For example, global warming could lead to rising sea levels, creating soil erosion and flooding that reduces the supply of resources in an area. Alternatively, high levels of population growth, as commonly found in developing countries, can increase demand pressures on local agricultural yields or fish stocks. Finally, government policies can create unequal access to resources, with certain groups being favored over others. The Israeli government, for example, routinely allowed Israeli settlers greater access than Arab settlers to scarce water resources in the West Bank settlements.

Social Pressures

Environmental scarcity can negatively impact social relations and economic development, which can increase tensions between states and groups and create conditions ripe for conflict. Scholars note four *social pressures* in particular that can lead to conflict: reduced agricultural production, economic decline, population displacement, and disruption of normal patterns of social relations (Homer-Dixon, 1991).

Reduced Agricultural Production

Reduced agricultural production could result from numerous environmental changes, such as deforestation, increased runoff, soil erosion, and flooding from climate change. Agricultural land located in low-lying regions such as Bangladesh is particularly vulnerable to the more intense storms and flooding expected of climate change.

Indeed, changes in precipitation and insect migration patterns could have devastating impacts on agricultural yields. Likewise, deforestation practices accelerate erosion, leaving fertile lands vulnerable to flooding during seasons of high precipitation. It is unclear whether technological developments will be able to ensure continued increases in agricultural yields when resources are faced with these kinds of environmental changes. In developing countries in particular, agriculture is a large share of the economy and the key to economic growth, and the impact of reduced production would be profoundly felt (Homer-Dixon, 1998).

Economic Decline

A second social effect of environmental scarcity is centered on economic development. Economic decline can result from numerous environmental changes, such as environmental disasters from climate change, deforestation practices hurting river trade and decreasing fuel wood, the loss of fish stocks, and increased pollution's increasing the prevalence of human disease. Overall economic development may be constrained by these changes, or even more likely, such changes could result in an increase in the wealth gap between elites and non-elites (Homer-Dixon, 1998).

Short-term efforts at increasing economic production can have long-term implications that lead to overall decline. Logging, for example, can be a productive industry in the short term, but deforestation can lower productivity over time. Likewise, increasing energy consumption is a mark of development, but the long-term implications of global warming can be very costly. Indeed, in 2006 the *Stern Review on the Economics of Climate Change* noted that halting global warming would cost around 1% of global gross domestic product—but failing to do so could cost up to 20% of gross domestic product (Stern, 2006).

Migration

A third potential impact of environmental scarcity is an increase in the number of environmental refugees (Jacobson, 1988; Westing, 1992) migrating because of environmental pressures in their home region (push) or economic opportunity elsewhere (pull). Homer-Dixon (1998) suggests that a key factor influencing migration is the gap between satisfaction in the home region and expected satisfaction in the new region. For example, migration patterns in China from rural to urban regions can partially be attributed to scarce resources in the interior leading to lower rates of economic growth. This may be due to either environmental change or, more likely, high rates of population growth, which create demand scarcities on resources. Citizens leave, not only because of the lack of resources in the home region but in order to seek opportunities in areas of higher growth.

Disruption of Social Relations

The fourth impact of environmental scarcity is a disruption of normal patterns of social behavior. "Scarcity sharpens distinctions between winners and losers—between groups that profit from scarcity and those that are hurt" (Homer-Dixon, 1998, p. 96). Groups that may have peacefully coexisted in a time of plenty become encouraged to focus on group survival, creating tense interactions with other resource-dependent groups also focused on survival. Existing divisions between ethnic, religious, and linguistic groups become reinforced, and these groups may decide to confront authority figures with violence rather than with peaceful negotiation. Social institutions such as the state itself may become fractured as a result (Homer-Dixon, 1998).

Conflict Types

These social effects may, in turn, cause several specific types of acute conflict, including scarcity disputes between countries, clashes between ethnic groups, and civil strife and insurgency, each with potentially serious repercussions for the security interests of the developed world. Three types of conflict might result from the social pressures caused by environmental scarcity.

*Environmental Scarcity**Leads to Simple Scarcity Conflicts*

Simple scarcity conflicts arise when structural conditions lead states to use violence to increase their share of the resource pie (Choucri & North, 1975). Structural theories suggest that as the power of challenger groups rises, challenger groups may choose to challenge the existing authorities with violence rather than with peaceful measures, in anticipation of moving from challenger to authority (Homer-Dixon, 1998). Simple scarcity conflicts, therefore, can be considered *resource wars*. Although conflicts over coal, oil, or other strategic resources would fit into this category, the clear focus is on wars over renewable resources. There are a number of examples of the former, such as World War I, the Falklands War, and the Persian Gulf War, but the latter is much more rare, leading the Toronto Group to downplay the role of environmental scarcity in causing this type of conflict.

*Environmental Scarcity**Leads to Group Identity Conflicts*

A second type of conflict occurs when population growth and migration create problems between groups. *Us versus them* conflicts develop as groups move from areas in decline to areas of new opportunities and interact with the inhabitants, who now must split their fixed resources among more people. These demand-type scarcities exacerbate tensions

between groups that may have peacefully coexisted in the past and interact with other social and political factors to create possibilities for violent conflict. The conflicts in Darfur and Rwanda could fall into this category.

*Environmental Scarcity**Leads to Insurgencies Against the State*

Environmental scarcity can also increase the likelihood of violent challenges to the state. As one group experiences deprivation, it will measure its access to resources against the access of other groups, particularly those holding political power. As the relative deprivation of a group not in authority increases, a sense of economic justice may lead to an increase in its grievances against the group with authority. It may look for opportunities to challenge the group in power, and circumstances may align to lead to a change in the relative power between these groups. If the disenfranchised group perceives that power relations have changed, then it may choose to address its grievances against current authorities through violence. For example, in the early 1990s in Chiapas, Mexico, economic reforms weakened the existing regime and its ability to maintain power through coercive measures. Other social institutions—notably the Catholic Church—stepped into the gap, creating social support for challenger groups and helping to create an "insurgent consciousness" (Homer-Dixon, 1998).

Critiques

The work of the Toronto Group is not without its critics. Criticism of these arguments focuses on three main areas: the definition of environmental conflict and security, a chicken-and-egg debate over whether environmental scarcity leads to or results from conflict, and the empirical evidence supporting the above hypotheses.

Defining Environmental Security

The Toronto Group's argument advocates a comprehensive view of security issues that includes environmental causes of conflict. Several scholars disagree with this approach. Frederick (1999) argues that security should be divided into two categories: traditional security issues and nontraditional problems. Deudney (1999) takes this claim further, noting that environmental security issues have causes that are fundamentally different from the causes of traditional security concerns. Traditional threats, for example, result from external aggression and provoke an us-versus-them mentality; environmental conflict, however, is a long-term threat that requires states to cooperate in order to solve it. Scholars continue to be divided over whether to treat environmental causes of conflict as a neglected element of traditional security concerns or as a completely different issue (Matthew, 1999).

The Direction of Causality

Some scholars note that environmental scarcity may actually be the result of conflict, rather than its cause (Gleditsch, 1998). According to this line of reasoning, conflicts engineered for political or economic reasons can have crucial environmental impacts, disrupting social order and economic life. These critics note that it is very difficult to tease out the individual role played by environmental factors in causing war and that current empirical research has failed to show that environmental scarcity is the cause rather than the result of conflict.

Empirical Evidence

Critics also cite the lack of conclusive empirical evidence for environmental security theories as a reason to doubt their validity. Much of the early work in the field focused on anecdotal examples rather than rigorous hypothesis testing. Later efforts by the Toronto Group attempted to address this grievance through multiple case studies, which suggest support for the theory. As noted below, the empirical evidence is decidedly mixed, with some studies (Hendrix & Glaser, 2007; Urdal, 2005) supporting claims that environmental factors increase the risk of armed conflict and others (Binningsbo, de Soysa, & Gleditsch, 2007; de Soysa, 2002) showing that the same factors actually reduce conflict risk. Indeed, many scholars remain concerned about the veracity of the Toronto Group's claims, as methodological issues persist (Buhaug, Gleditsch, & Theisen, 2008; Gleditsch, 1998).

Applications and Empirical Evidence

Much of the debate over the role of the environment in causing conflict has focused on the empirical evidence supporting the claims of the Toronto Group. Numerous case studies provide evidence of links between environmental scarcity and conflict, but these studies are often plagued by methodological concerns (Gleditsch, 1998). Quantitative approaches are more recent and have had decidedly mixed results. Most recent studies have focused largely on the issue of population growth and density and their causal role in conflict, but the other types of conflict have also received their share of attention.

Environmental Scarcity and Conflicts of Simple Scarcity

Salehyan (2008) notes that "while environmental degradation is certainly not a necessary condition for armed conflict, neither is it a sufficient one" (p. 317). Indeed, there is little evidence supporting the role of environmental scarcity in creating simple scarcity conflicts despite the many cited examples of "resource wars." The

distinction is that while wars are frequently fought over nonrenewable resources, wars fought over the renewable resources that define environmental scarcity are much rarer. Scarce nonrenewables such as oil and coal are frequently fought over, probably because they are more easily transformed into state power than renewables are.

The only scarce renewable resource that appears to strongly contribute to conflicts is river water. When a dependent downstream country relies on an upstream country to keep the flow moving along, conflict can arise should the upstream country decide to limit supply in any way. Water scarcity issues play a particularly important role in Israel and peace efforts in the Middle East. The differences in socioeconomic conditions between Israelis and Palestinians are only exacerbated by unequal access to scarce water resources (Lowi, 1999). Water has also been used as a strategic tool. For example, to compel Syria to take action against Kurd separatists, Turkey threatened to restrict the flow of the Euphrates River. But some scholars note that although water can play a role in conflicts, it is difficult to pinpoint cases in which inequalities of water distribution were a key cause of conflict (Loneragan, 2001).

Environmental Scarcity and Conflicts of Group Identity and Insurgency

Most of the empirical studies of the connection between environmental scarcity and conflict focus on group-identity conflicts, particularly those that create social instability and lead to insurgencies. Anecdotal evidence is particularly strong in this area—proponents cite, for example, the high levels of migration from Bangladesh to India as a causal factor in conflicts in border Indian states. Likewise, political instability in China could be attributed to population pressures on limited arable land (Goldstone, 2001).

Hauge and Ellingsen (1998) conducted a study showing that land degradation, freshwater scarcity, population density, and deforestation have direct positive effects on the incidence of civil war. They isolated the role of environmental causes from other sociopolitical causes of conflict and found evidence in favor of environmental scarcity's role in causing conflict. Attempts to replicate this study have been unsuccessful, however (Theisen, 2008). Tir and Diehl (2001) found a statistically significant connection between population growth and involvement in militarized interstate disputes. A study by Miguel, Satyanath, and Sergenti (2004) found that the effect of unexpectedly low precipitation levels on national economic growth in countries of sub-Saharan Africa increased their risk of civil war. Other scholars have made similar findings, demonstrating a connection between increased water scarcity or changes in precipitation and conflict (Hendrix & Glaser, 2007; Raleigh & Urdal, 2007). The connection between population density

and the likelihood of conflict has received particular attention. Scholars note that pure population growth does not capture the demand-side issue of scarcity unless density is also accounted for (de Soysa, 2002; Raleigh & Urdal, 2007; Urdal, 2005). However, some scholars have found that population density does not play a role (Tir & Diehl, 2001) and that resource wealth, rather than scarcity, is associated with an increased likelihood of conflict (Binningsbo et al., 2007).

Process tracing of numerous case studies also provides evidence for the role of environmental scarcity in provoking or exacerbating group conflict. Water issues in Gaza provoked tensions between Arab and Israeli settlers, and social turmoil in South Africa in the late 1980s can be partially attributed to unequal access to resources by Blacks and Whites (Kelly & Homer-Dixon, 1998; Percival & Homer-Dixon, 2001). In the Philippines, degradation of cropland and forests has exacerbated economic problems, and insurgency movements have been empowered by the poverty of agricultural workers operating in areas of weak central government. However, evidence in at least one case—the Rwandan genocide—shows that although environmental degradation and high population density were present, these factors did not play a major role in escalating conflict between Hutus and Tutsis (Percival & Homer-Dixon, 1998).

The empirical record for a generic connection between environmental scarcity and armed conflict is therefore decidedly mixed. As many critics have pointed out, existing efforts have failed to produce robust findings confirming that environmental factors play a role separate from other sociopolitical causes of conflict (Buhaug et al., 2008). However, the case studies and quantitative efforts do suggest that the hypotheses of the Toronto Group cannot be ignored and merit further study.

Policy Implications

The empirical evidence does suggest that environmental scarcity can increase the likelihood of certain kinds of conflict. Policymakers eager to avoid these types of conflict can take several pieces of advice from scholars.

Homer-Dixon (1991) noted that there are two paths to avoiding conflicts posed by environmental scarcity. One possibility is to become a “hard” authoritarian regime, cracking down on any social unrest that results from resource scarcity or population pressures. A second option is to promote technical and social ingenuity (Homer-Dixon, 2002): *Technical ingenuity* can lead to more efficient uses of scarce resources, diminishing the need for conflict over their use and ownership, and *social ingenuity* can create an economy and a society that do not rely on the consumption of scarce resources to survive.

If all else fails, standard military reactions to conflict are available for outbreaks of violence caused by

environmental scarcity. Butts (1999) notes that the U.S. military has extensive resources and skills that can easily be brought to bear on any conflicts that arise this way.

Environmental scarcity does pose a profound challenge to policymakers. Many policies that can lead to conflict via environmental changes are grounded in principles of economic development. For developing countries, for example, deforestation practices are designed not to destroy the environment or degrade agricultural land, but to provide fuel for the locals and lumber for trade. Indeed, practices viewed by wealthy, developed countries as degrading the environment are viewed by poorer, developing states as practical necessities for strong economic growth. It can be very difficult for policymakers to focus on the potential long-term implications of policies designed to produce short-term economic gains. Policymakers therefore must pay particular attention to the concerns of developing countries if they hope to mitigate the effects of environmental change on future conflicts.

Further challenges are posed by the nature of environmental problems. Political borders mean little to rivers, oceans, or the atmosphere. One state’s pollution can quickly become the problem of its neighbors and indeed the entire globe. For example, the greenhouse gases causing global warming are emitted by many states, but more than 40% of the total comes from the United States and China. These gases—and their effects on the warming of the globe and climate change—do not affect only the emitters, however. Their impact will be felt by every country on the planet, including those states that emit zero greenhouse gases. Collective action is required to address these causes of conflict. Therefore, as they craft international regimes promoting cooperation, policymakers should pay particular attention to designing regimes that can manage environmental causes of conflict.

Future Directions

Empirical testing of the Toronto Group’s hypotheses is still in the preliminary stages, and additional analysis is needed. In particular, scholars are beginning to pay close attention to isolating the environmental causes of conflict from more traditional political and economic factors (Hauge & Ellingsen, 2001). More research in this area in particular is needed to settle long-standing debates on whether environmental factors by themselves are likely to cause security problems and indeed whether environmental conflict should be treated similarly to more traditional sources of conflict.

As noted in the previous section, international collective action is frequently the key to addressing environmental issues. In recent years, scholarship has focused on the issue of the design of international regimes, paying close attention to how these regimes can be designed to

promote cooperation and compliance (Koremenos, Lipson, & Snidal, 2001). Scholarship on environment and conflict could benefit from a closer look at this related discipline and draw new conclusions on how to minimize the environmental sources of inter- and intrastate conflict.

Finally, scholars are starting to question the Toronto Group's assertion that climate change will be a minimal driver of conflict in the near future. Scientific assessment has accelerated the timetable by which the major effects of climate change will be felt, and the actions that policymakers take today can have a direct impact on the likelihood of conflict in the future. Many scholars have taken up the task of analyzing policy options that could mitigate the impact of climate change generally (Rabe, 2004), but few have focused their attention particularly on the security implications of climate change and how they might be avoided or alleviated. The recent explosion in work on climate change in general bodes well that this crucial issue will soon receive some much-deserved attention.

Conclusion

This chapter introduced the role of environmental change and scarcity in causing conflict. The Toronto Group's claim that environmental scarcity creates social changes that create a breeding ground for conflict led to a series of debates on where environmental issues fall along the traditional spectrum of security studies. Empirical evidence suggests that there is some support for the Toronto Group's contentions; however, further analysis is needed, as is a better conception of the term *environmental conflict*. Recent developments in the study of the design of international institutions, however, provide hope that policymakers may be able to minimize the impact of environmental change as an instigator of conflict.

TOTALITARIANISM AND AUTHORITARIANISM

EDWARD WEBB

Dickinson College

In the 20th century, some of the darker consequences of the industrial and political revolutions of the late 18th and early 19th centuries appeared: industrialized slaughter and mass terror organized by powerful states against their own societies. Events such as the Holocaust, Stalin's terror, and China's Cultural Revolution challenged political scientists to explain how and why states could govern in such ways. Although the century ended with a wave of democratization in many parts of the world, different types of nondemocratic regimes that had been pervasive outside western Europe and North America persisted in smaller but still very significant numbers. In the 21st century, political science must continue to analyze nondemocratic regimes and to ask questions that have challenged the discipline for decades (at the very least since the rise of fascism, Nazism, and Stalinism in the period between the two World Wars):

- How can we most usefully categorize and distinguish the types of nondemocratic regimes?
- How do such regimes arise?
- How do they maintain their grip on power?
- Under what circumstances can they fall?

This chapter explains some of the challenges to adequately defining and describing different kinds of nondemocratic regimes and introduces theoretical perspectives and approaches to their study. It then explores some more specific empirical questions on the rise, performance, and demise

of such regimes in the 20th and early 21st centuries. Last, it offers some suggestions for fruitful directions for further research.

Theoretical and Definitional Questions

Definitions and Typology

Although the theoretical origins of modern authoritarianism may be found in classics of political thought including Plato's *Republic*, Hobbes's *Leviathan*, and Rousseau's *On the Social Contract*, most modern political science analysis is informed, at least implicitly, by Max Weber's (1947/1964) concept of *legitimate authority*. According to Weber,

There are three pure types of legitimate authority. The validity of their claims to legitimacy may be based on: 1. Rational grounds—resting on a belief in the “legality” of patterns of normative rules and the right of those elevated to authority under such rules to issue commands (legal authority). 2. Traditional grounds—resting on an established belief in the sanctity of immemorial traditions and the legitimacy of those exercising authority under them (traditional authority); or finally, 3. Charismatic grounds—resting on devotion to the specific and exceptional sanctity, heroism or exemplary character of an individual person, and of the normative patterns of order revealed or ordained by him (charismatic authority). (p. 328)

Modern liberal democracy is based on legal authority, the legitimacy granted by the results of free and fair elections held according to procedures to which, at least notionally, all citizens have given their assent. Other modern regime types draw on a broader array of justifications for their rule. This does not mean that nondemocratic regimes derive their authority exclusively from traditional or charismatic sources, although both kinds of authority have existed and do exist in nondemocratic regimes, such as in some of the monarchies of the Middle East (for all that they are modern creations, their appeal is to traditional allegiances) or the charismatic appeal of a Hitler, a Franco, or a Peron. Some political scientists have adapted Weber's concept of traditional rule to develop modern categories of *neopatrimonialism* or *sultanism* to describe many of the regimes of the Middle East and sub-Saharan Africa, but not all scholars of authoritarianism use these terms.

Most authoritarian regimes rely on a mix of legitimacy and coercion. The tools available to a regime in control of a modern state both to communicate its legitimacy and to apply coercion far outstrip what was available to historical autocrats, even absolutist monarchs such as Louis XIV of France. Modern states are capable of organizing a whole society, should they choose to, through communications technology, pervasive bureaucracy, and sheer firepower.

Authoritarian systems are nondemocratic systems. Put another way, authoritarianism is the absence of or limit on *polyarchy* (Dahl, 1979) or even a limit on politics per se:

In authoritarian systems there is only a limited form of politics, for power struggles among factions in one party regimes and disagreements among soldiers or bureaucrats are not the same as real politics, which must operate in the context of a civic culture. (Pye, 1990, p. 15)

Although the absence of democracy is at the heart of the definition of authoritarianism, it is important not to equate authoritarianism simply with the absence of elections. Elections are used as a tool of legitimation by virtually all regimes, given the almost universal need to claim to rule on behalf of the people. There are many techniques whereby an election or referendum can be manipulated to achieve the outcome desired by the incumbents or to limit the outcome to a circumscribed range of possibilities. In the Islamic Republic of Iran, candidates for public office compete in genuinely competitive elections, but the religious authorities exclude many possible candidates from competing. In Egypt, the Muslim Brotherhood is banned from operating as a political party, meaning that its candidates must run as independents. Moreover, the process of voting itself is often marred by ballot-stuffing, voter intimidation, bribery, and other practices. In single-party regimes, of course, only candidates of the ruling party may run. It is not the case that elections in all these cases are entirely meaningless. What is crucial is that the ruling elite finds means to insulate itself from effective challenge via the ballot box.

What varieties of regime are there? A straight binary division between democracies and nondemocracies is likely to obscure more than it reveals. However, how one develops and applies a typology to regimes that enables fruitful development of theory and empirical analysis is an issue that has yet to achieve a consensus among political scientists and continues to present challenges to theory development. In a recent argument about the problems of regime typology, Stephen Hanson and Jeffrey Kopstein (2005) warn of generating "as many taxonomies as social researchers" (p. 77).

One approach would be to have a finely grained typology that has many separate categories—for example, dictatorship could be divided into *autodictatorship* (no elections), *monodictatorship* (noncompetitive elections), and *semidictatorship* (semicompetitive elections; Brooker, 2000), and then each subtype could be further divided into military, party, or personal rule. Or one might choose a sliding scale from nondemocracy to near-democracy (Diamond, Linz, & Lipset, 1988). This approach is used by organizations such as Freedom House, which assigns a democracy "score" to regimes worldwide. Another approach would have a few broad categories and then qualify the members of those categories with adjectives, an approach designed to "adequately characterize the diverse regimes that have emerged in recent years [while] maintaining conceptual validity by avoiding conceptual stretching" (Collier & Levitsky, 1997, p. 448). This approach yields concepts such as "soft" authoritarianism and "illiberal" democracy (see Chapter 31, "Semi-Authoritarianism," and Chapter 32, "Models of Democracy," in this handbook).

How one categorizes different regimes will be informed by which characteristics one believes to be theoretically important. In a 2007 article, Axel Hadenius and Jan Teorell consider institutional variables the most important indicators of which authoritarian regimes are likely to be sustainable and which prone to democratization. Their typology first sets a firm dividing line between democracies and autocracies and then further divides the latter category into monarchies, military regimes, and electoral regimes, whether no party, single party, or limited multiparty. Bradley Glasser (1995), in contrast, develops a typology of Middle East regimes based on access to resources, in order to explain the durability of some authoritarian regimes in the region and the relative liberalization of others.

Identifying which are the most productive typologies remains part of the challenge for future research. For an excellent overview and discussion of work on typologies to date, see Paul Brooker (2000). It may be helpful here to identify certain broad categories of regime, based on institutional structure, before considering the particular problems raised by the term *totalitarian*.

Party regimes are those in which government is by a sole or dominant party. A *single party regime* has one party identified with the state and permits no others to

operate. Even among this group, there is potentially considerable variation in terms of the ideology through which the party justifies its rule, whether the party has its own security structures or militias, and other variables. A *dominant party regime* allows limited competition from other parties. Party regimes may be of any ideological complexion, although two common types are of the far left (communist or socialist) on one hand and the far right (fascist or nationalist) on the other. *Populist* parties might combine elements usually associated with both left and right. Arguably, ideology is less useful in analyzing these regimes than in recognizing the party as primarily an instrument for maintaining power.

Another common kind of nondemocratic system is the *military regime*, although here again the label covers, theoretically and in practice, a great range of systems. The military may rule directly, through a dictator or ruling council. It may rule indirectly, through alliance with civilian politicians that it chooses and who rule at its pleasure. It may rule through a *front party*, at which point it of course displays elements of the party *and* military regimes. A military regime may represent the military as a whole or only one section of it. It may aspire to permanent rule or see its intervention into politics as a temporary measure to redress some severe problem, such as a threat to national security or a threat to the interests of the military itself as an institution.

A third kind of nondemocratic regime is the *personalist regime*. This is the dictatorship of an individual and is more likely than the two previous types to be based on traditional or charismatic, rather than legal, authority. One key distinction between this and the previously discussed types is that the basis of the regime's claim to rule is the person of the ruler or rulers, whether they are in power as a result of their own nature or achievements or via descent or other connection to revered authority.

One of the enduring classics on authoritarian regimes is Hannah Arendt's (1951/1973) *The Origins of Totalitarianism*. Yet there has been much debate about whether the term *totalitarianism* has much analytic utility separate from the broader notion of authoritarianism. Written in the aftermath of World War II, Arendt's work was primarily an attempt to explain the cataclysm that had overtaken Europe at the hands of the Nazi regime. How could human progress have become so badly derailed? At least part of the answer was in the unprecedented ability of modern movements and states to dominate society and individuals utterly: "Totalitarianism has discovered a means of dominating and terrorizing human beings from within" (Arendt, 1951/1973, p. 325). Another part was the rise of mass politics; of the rule of the mob and the failure to uphold the rights of minorities and individuals; and of the attempt to impose uniformity on people, to make them into a whole, a total unity.

Another classic arguing for the distinctiveness of totalitarian regimes is Carl Friedrich and Zbigniew Brzezinski's (1965) *Totalitarian Dictatorship and Autocracy*. They

argue that all totalitarian dictatorships possess the following characteristics:

1. An elaborate ideology, consisting of an official body of doctrine covering all vital aspects of man's existence to which everyone living in that society is supposed to adhere. . . . 2. A single mass party typically led by one man, the "dictator," and consisting of a relatively small percentage of the total population. . . . 3. A system of terror, whether physical or psychic, effected through party and secret police control. . . . 4. A technologically conditioned, near complete monopoly of control, in the hands of the party and of the government, of all means of effective mass communication. . . . 5. A similarly technologically conditioned, near complete monopoly of the effective use of all weapons of armed combat. 6. A central control and direction of the entire economy. (p. 22)

They did not present this list of six traits as exhaustive but argued that they had "been generally acknowledged as the features of totalitarian dictatorship" (p. 23).

A totalitarian regime is one that successfully controls all aspects of society, abolishing the distinction between public and private, aspiring even to control the most intimate aspects of individuals' lives and thoughts. Powerful literary portrayals of such regimes can be found in Orwell's *1984*, Aldous Huxley's *Brave New World*, Terry Gilliam's film *Brazil*, and other works. One objection to the application of the term in political science is that arguably such societies have not existed historically, even if regimes have aspired to such levels of control. If there have been totalitarian regimes, at most the term could be applied to the Third Reich, the Soviet Union under Stalin, arguably Iraq under Saddam Hussein, and possibly North Korea. Fascist Italy should not be included:

Fascism had aspirations to be "totalitarian"; Mussolini virtually invented the term. But . . . it is clear that Mussolini's grip on Italian society was not as firm, his influence so pervasive, as that of a Hitler or a Stalin. Fascism left huge areas of Italian life practically untouched. (Lyttelton, 1987, p. 1)

Some question whether even the Hitler or Stalin regimes, with their pervasive propaganda and state terror, did not themselves still leave significant areas of life untouched. Saddam's regime and leader cult aspired to invade all areas of life, to turn children against parents, to make everyone an informer, and succeeded to a remarkable extent (al-Khalil, 1990). And it is hard to make any firm assessment of North Korea since it remains the "hermit kingdom"—a closed society ruled by a paranoid dynasty through many of the tools used by the other named regimes but very difficult for outsiders to investigate and assess (Daniel Gordon's documentary *A State of Mind* is a rare window on the tools used by the secretive regime to manage society).

Some have objected to the term *totalitarianism* as theoretically empty, for instance on grounds that it is simply

a particular instance along the spectrum of authoritarianism (Barber, 1969), while others want to apply it quite widely in recognition of the ambitions of many modern authoritarian regimes, even if they ultimately fall short of total management of society (Friedrich, 1969). But one of many important contributions to the field by Juan Linz (1975) argued for a threefold distinction between *totalitarian*, *authoritarian*, and *democratic* regimes (setting aside anomalies such as sultanistic regimes), arguing that totalitarian and authoritarian were distinctive types of nondemocratic regimes rather than instances along a continuum. For Linz, the characteristics of authoritarian regimes that distinguished them from totalitarian regimes were the presence of limited political pluralism and either demobilization of the population or limited and controlled mobilization.

Theoretical Approaches

Brooker has argued that there can be no theory of authoritarianism *per se*. Rather, we can study different kinds of authoritarian regimes and attempt to account for different aspects of them—how they come to exist, how they maintain power, and what can cause them to fail. Nevertheless, in the attempts made to date to explain these different aspects, we can discern several broad approaches, including those rooted in psychology, in the analysis of ideas and ideologies and in structures and institutions.

One older approach is based in psychology, particularly associated with the Frankfurt School, blending elements of Freudian and Marxist thought. The classic work here is that produced by Theodor Adorno and collaborators (1950), *The Authoritarian Personality*. This approach takes individual characteristics as the enabling condition of the rise of mass movements, explaining those characteristics themselves as produced by the social conditions of modern life. Wilhelm Reich (1970) offers a flavor:

“Fascism” is only the organized political expression of the structure of the average man’s character . . . the basic emotional attitude of the suppressed man of our authoritarian machine civilization and its mechanistic mystical conception of life. It is the mechanistic mystical character of modern man that produces fascist parties, and not vice versa. (p. xiii)

Another approach is interpretive, treating ideas and ideology as having explanatory power. Arendt’s (1951/1973) work, while also sociological and historical, certainly pays attention to this dimension. More recently, Lisa Wedeen (1999) has applied an interpretive lens to the Syrian leader cult, drawing striking conclusions about how its very implausibility and absurdity make it a powerful tool for retarding the emergence of an effective civil society.

The historical-institutional approach, or historical sociology, which ultimately draws from both Marx and Weber, has produced much fruitful work in this domain. Skocpol’s work on social revolutions is a very influential

example of this approach, but there are many others, including Linz and Guillermo O’Donnell. Recent exemplars include the contributors to the special issue of *Comparative Politics* in January 2004 on “Enduring Authoritarianism: Lessons From the Middle East for Comparative Theory” and the work of Jason Brownlee (2007), who studies ruling parties.

Brooker (2000) proposes a forensic approach to the study of the rise, maintenance, and fall of nondemocratic regimes; in other words, their analysis must consider motive, means, and opportunity. This is a broad comparative historical approach that does not commit the researcher *a priori* to favor agency over structure or vice versa, for example, and is designed to allow a broad range of comparison among nondemocratic regimes and between them and their democratic counterparts. It is a useful open framework within which more specific questions can be considered.

Empirical Questions

The Origins of Totalitarian and Authoritarian Regimes

Many modern authoritarian regimes have emerged as the result of revolutions, beginning with the Terror that followed the French Revolution and including the Bolshevik Revolution of 1917 in Russia and the later revolution in China led by Mao Tse-tung. This last established an authoritarian regime that has persisted into the 21st century in the world’s most populous country. The Iranian Revolution from 1977 to 1979 ushered in a unique form of partially democratic rule, the Islamic Republic.

Theda Skocpol (1979) established a structural and comparative historical framework for the analysis of revolutions in *States and Social Revolutions*, which remains required reading in the field. She concluded that the classical Marxist prediction of revolutionary change driven by class conflict did not pay sufficient attention to state power, failing to “adequately explain the autonomous power, for good or ill, of states as administrative and coercive machineries embedded in a militarized international states system” (p. 292). Revolutions largely came about due to the weakening of the state’s ability to maintain its monopoly on the legitimate use of force, frequently due to a combination of international pressures—war, above all—and socioeconomic pressures within. She also argued that in direct contradiction to the Marxist prediction of the withering away of the state after a successful revolution, rather “the new-regime states that emerged in France, Russia, and China alike were stronger and more autonomous within society” (p. 285). While the ideological and socioeconomic complexions of these three postrevolutionary regimes were quite different, the strengthening of the state was a common outcome in all. In the latter two cases, as in many other 20th-century examples of authoritarian

regimes, the state's authority was seen as a necessary tool to apply to the problem of "catching up" with more economically developed countries.

Iran's revolution posed a challenge to this understanding of social revolution, as Skocpol (1982) conceded in an article published not long after her 1979 work. In contrast to her account of those earlier revolutions, she found herself having to recognize a larger independent causal force for ideas and ideology and to stress agency over opportunity. The Iranian revolution came about not in a state weakened by war, but in one where the U.S.-backed regime of the Shah had at its disposal significant military, police, and intelligence resources. This revolution did not simply "come" but was definitely "made" by a coalition of dissatisfied social forces.

Capturing the state and then using its institutions as machines to transform and better society are common goals of revolutions, whatever the details of their mobilizing ideology. Rather than pay attention to ideology, then—to "motive," in Brooker's approach—it is possibly more fruitful to consider the questions of means and opportunity.

Opportunity has often emerged through the breakdown of the existing social and political order, such as via wars, economic disruption, and failure of institutions, as seen in Italy and the Weimar Republic of Germany between the two World Wars. In these circumstances, revolutions can be genuinely *social* in the sense that they are driven by a broad movement of citizens seizing power, although it is usually a rather small group of people who seize the moment to knock out the previous regime. But in the latter half of the 20th century, the dynamic was different because state institutions, and the instruments of state coercion above all, were stronger than in earlier times. Regime change tended to be imposed through military force, from within or without: "Once decolonization was completed, with modern military establishments successfully installed, then social revolutions became much less likely—although military coups of various sorts have become very frequent" (Skocpol, 1979, p. 290). The ability of states to maintain order, to prevent mass mobilization against themselves, has developed, particularly as a result of technological advances. The prospects for social revolutionaries have correspondingly diminished such that some recent analyses more or less exclude any significant role for ordinary citizens in the rise of authoritarian regimes, seeing authoritarianism instead as the outcome of elite decisions, with citizens more or less innocent bystanders who would on the whole prefer democracy (e.g., Bermeo, 2003).

One variation is bureaucratic or elite "revolutions," an idea particularly associated with O'Donnell's (1973) concept of *bureaucratic authoritarianism*, based on his studies of South America and developed and refined in his subsequent work. But this kind of top-down revolution has a longer pedigree, as Ellen Kay Trimberger (1978) found when she studied the Meiji Restoration in 19th-century Japan, the Ataturk regime that founded modern Turkey in the early 20th century, the regime of Gamal Abdel Nasser

in mid-20th-century Egypt, and the Peruvian military junta that took power in 1968. These were examples of what she terms *revolution from above*, to distinguish them from regimes produced either by mass-based revolutionary movements or by straightforward military coups. Revolutions from above, she argues, were revolutionary in that through force or the threat of force a new group took over the central state apparatus and destroyed the economic and political power of the previously dominant social group. But revolutions from above were distinctive in that those taking over were senior military and civilian bureaucrats; that along with little or no mass participation, there was relatively little violence; and that there was little appeal to radical ideology, but rather pragmatic, gradual change. Where Trimberger parts company with earlier thinkers on revolutionary change, such as Marx and Weber, is in making the bureaucracy an actor rather than a tool of other actors (dictators, parties, mass movements) and arguing that while many bureaucracies in industrializing countries may tend to be conservative, some can become forces for change rather than continuity. In this she supports O'Donnell's emphasis on state bureaucrats—military and civilian—as the architects of state-driven social change. The regimes he studied in South America, a region in which many countries had long histories of democracy since independence, often followed the pattern of a military coup's leading to either direct rule by the military or indirect rule through a front political party or organization. Like Turkey, but unlike Egypt, those regimes have now given way to democracies once more, as has South Korea, once also described as a bureaucratic-authoritarian regime.

Diminishing opportunities for social revolution as a result of stronger states may direct us to pay particular attention to the means employed in building nondemocratic regimes. Revolutions are almost always achieved through the application of military force, conventional or unconventional. For example, Thomas Hammond (1975) concluded that from the Bolshevik Revolution onward, Communist regimes came to power only with the aid of significant military force. This is clearest in the case of *exported revolutions*, in which the Soviet Red Army either annexed territories directly to the Soviet Union or installed Communist regimes in other states, many in the immediate aftermath of World War II, but also including the counter-revolutions in East Germany (1953), Hungary (1956), and Czechoslovakia (1968). These are not, of course, the same as the social revolutions analyzed by Skocpol in that they were not the overthrow of a weakened political and economic order by organized social forces from below. But *indigenous takeovers* do more closely resemble the classic social revolutions and also rely on military force. The most common pattern, contrary to classical Marxist predictions of the industrial proletariat as the motor of revolution, is of takeovers starting in the countryside and then spreading to the cities. Examples are Mao's China, Yugoslavia, Albania, and Vietnam (Hammond, 1975). Almost all cases of both indigenous Communist takeovers and exported revolutions

occurred during or soon after international wars that weakened the existing order. In other cases of newly emerging authoritarian regimes, the military coup was the most common pattern, particularly in Latin America and much of postcolonial Africa.

How Totalitarian and Authoritarian Regimes Rule and Survive

In order to understand how nondemocratic regimes maintain their power, we might think the obvious place to start would be with coercion and fear—images of the Soviet gulag or South American death squads or pervasive insecurity generated by secret police forces. We do indeed need to understand the workings of these technologies of power and control, but we must recognize that the range of tools available to modern authoritarian states is broader than those that are directly coercive. And we should understand also that even in regimes that are capable of startling brutality toward their own population, the surest way to stay in power is legitimacy, that is, the consent of the governed.

Although, by definition, nondemocratic regimes do not have the legitimacy that comes as a result of free and fair elections, it is typical and important that they claim to rule in the name of and on behalf of “the people.” Arendt (1951/1973) and others speak of *mass politics*, in contrast to *democratic pluralism*: Authoritarianism often rests on the notion of the citizenry as a single, homogeneous body that finds its expression in the regime, party, or leader. Taken to an extreme, as in the Third Reich, this can lead to programs of expulsion or extermination of the “other.”

How do authoritarian regimes acquire and sustain legitimacy in practice? Sometimes a charismatic leader or one claiming legitimacy through descent or religious sanction may be the source of the regime’s claim to power. But more common is a claim by performance, the regime’s keeping its side of an implicit or explicit bargain—obedience on the part of the population met with the provision of services on the part of the state, whether this be in the form of development, social welfare, or the provision of security. There may also be the provision of what we might think of as psychological goods, such as national pride. We might naturally associate this idea of state provision of benefits in return for obedience with regimes of the left. But one historian of 20th-century fascism points out that regimes of the right also tended to seek legitimacy through performance, by promising to deliver rapid industrialization and national independence without the social dislocations associated with the earlier industrializing states, thus appealing to social conservatism and people’s attachment to order. Adrian Lyttelton (1987) describes Italian fascism in these terms:

[It] aimed at modernization without modernity. In other words, it aimed to appropriate the advantages of technical and economic progress, while rejecting the political, cultural, and

social changes that had been associated with industrialization in Britain and the USA. . . . Fascism started from modernist premises (futurism) and ended by espousing policies of a much more traditionalist kind (ruralism); national socialism started from anti modernist premises (“Blood and Soil”), but ended up by promoting rapid industrialization and urbanization. (pp. 437–438)

Similar appeals to “modernization without modernity” have marked many regimes of the later-developing global South. Malaysia’s former Prime Minister Mahathir Mohamad, among others, is well-known for his espousal of a doctrine of “Asian values,” by which he meant his regime would deliver economic development without political liberalization, which, he argued, was not in keeping with his society’s values and traditions. This approach has had some support from Western economists, politicians, and institutions, although certainly not all (Robison, 1996).

The difficulty with performance-based legitimacy is, of course, that the regime must perform. In the 1950s and early 1960s, there was significant support in political science and related disciplines and in the worlds of policy and politics for the idea that authoritarian regimes could aid in the process of catching up to the more advanced industrialized states. While *modernization theory*, popular in the early part of the cold war, posited that economic and political development moved hand in hand in the direction of greater liberalization, the idea that a more directive, interventionist state could produce more rapid economic development became accepted, not only among authoritarian regimes themselves and their supporters, but also among some development economists and political scientists, particularly those who studied the *Asian Tigers*—states such as Taiwan and South Korea that achieved rapid growth under illiberal, interventionist regimes. However, for every Singapore there was a Zaire, the latter being a classic example of a *predatory state*, where the dictator and his cronies stripped the country of resources and impoverished rather than developed it (the World Bank has termed predatory states *transfer economies*, that is, those in which political power determines the transfer of resources extracted from society to a particular, nonproductive group or class). Many military regimes pinned their legitimacy on outperforming the allegedly inefficient civilian regimes they had replaced, but as early as the 1970s, cross-national analysis already showed that military regimes varied as widely as their civilian counterparts in their performance, that there was no reason to expect that military regimes would deliver more rapid or more effective development than civilian regimes *as a general rule*, even while individual regimes of both kinds might perform well (McKinlay & Cohan, 1975). For arguments about the circumstances under which state intervention is developmental rather than predatory, see in particular the work of Peter Evans (1995).

The planned economies of the Soviet Bloc did achieve rapid industrialization and were able to compete militarily

with the earlier-industrializing West. But ultimately many projects of state socialism built on the Soviet model ended up providing neither bread nor freedom, neither prosperity nor liberty. An American Political Science Association president noted the following in his annual address as Soviet Communism was collapsing:

There is a growing awareness that authoritarian rule, whether Leninist or not, can be a liability in achieving progress. The idea that centralized authority enhances the state's ability to shape society has been dealt a blow by the record of performance of the states that have tried to carry the idea to the extreme. (Pye, 1990, p. 9)

Ideology and cultural authoritarianism are also useful tools for authoritarian regimes. While not even the totalitarian states have achieved the nightmare vision of Orwell's *1984* in terms of constant and ubiquitous surveillance and propaganda, of language stripped of meaning and citizens' very thoughts controlled by the state, most authoritarian regimes have intervened significantly in the domain of culture and public expression, through censorship and propaganda, to mold the environment and channel public discourse in useful directions. A striking instance of this is the *mass spectacle*, whereby regimes command masses of people to perform complex displays, providing both a sign of the regime's power and a disciplining exercise for the performers themselves. The German Marxist critic Siegfried Kracauer discussed the meaning of such displays in his essay collection *The Mass Ornament* (1995), and they can be seen in filmmaker Leni Riefenstahl's propaganda film *Triumph of the Will*, documenting the Nazi rally at Nuremberg in 1934. More recent North Korean and Syrian examples are shown in *A State of Mind* and discussed in Wedeen's (1999) *Ambiguities of Domination*. Other, more day-to-day conditioning of populations can be achieved through mass organizations such as political parties, regime-controlled trade unions, and similar institutions that function to discipline populations but not necessarily to mobilize them (see Kasza, 1995; Unger, 1974).

The tools of fear and coercion are an important complement to the tools of legitimacy and mobilization. Military and paramilitary forces, secret police and intelligence services, prison camps and torture chambers have all been key instruments of 20th-century authoritarian regimes and remain important. The eternal puzzle of *quis custodiet ipsos custodes?*—who guards the guards themselves?—applies here. Saddam Hussein maintained a complex system of rival intelligence agencies, spying on each other as well as the general population, the military, and so forth, and ultimately reporting only to him. The interesting questions are not so much about the functioning of such institutions but about how and why they break down in some circumstances while continuing to perform in others. Why did the Shah's forces stop firing on revolutionary crowds but People's Army troops did

not refuse to crack down on protesters in Tiananmen Square a decade later?

Authoritarian Regimes in an Age of Democratization

Since the collapse of the Soviet Union and its satellite regimes, and the wave of liberalization in Latin America that together make up what Samuel Huntington (1993) described as the "the third wave of democratization," much attention has been paid to transitions from authoritarianism to democracy (see Chapter 33, titled "Processes of Democratization," in this handbook). However, contrary to some who saw in the end of the cold war an end to ideological competition and the beginning of an age in which liberal democracy and free-market capitalism would spread worldwide, political scientists interested in authoritarianism have plenty of material to study in the 21st century. There are aborted or semitransitions, yielding what Fareed Zakaria of the Cable News Network calls "illiberal democracies" or semiauthoritarian regimes, such as Russia. And while there have been very real transitions to democracy in parts of the world, authoritarianism persists in China, North Korea, Central Asia, much of the Middle East, and many countries of sub-Saharan Africa.

Explaining the resistance of the remaining autocracies to global pressures toward liberalization, or, on the other hand, resisting the "end of history" mind-set and analyzing the authoritarian regimes on their own terms rather than as aberrations, has provided interesting challenges for students of comparative politics. Many of those specializing in the Middle East, for example, have been concerned with these questions. Syrian analyst Aziz Al-Azmeh (1994) argues for the importance of ideas and discourse in understanding the persistence of authoritarianism in the Arab world. The discourse of democracy has been co-opted by accident or design in a way that doesn't engage with core democratic ideas or values. Rather, a "populist discourse on democracy" (p. 121) has come to dominate, and populism is an ally of authoritarianism, not least because of the identification of "the people" with the state. Brownlee's (2007) cross-regional analysis takes institutions, rather than discourses, as the basis of its explanation of the resistance of regimes to democratizing pressures. His argument is that in the cases he studies, the key to regime survival is the creation of a dominant party that provides incentives to elites to stay aligned with the regime and can punish those who defect. The absence of such an institution in the case of Iran, for example, means elite politics are more fractious and politics in general more dynamic and open than in Egypt. This institutional approach deliberately compares Middle Eastern cases with those outside the region, rejecting any exceptionalist explanation for its relative lack of liberal democracy. Nevertheless, scholars continue to try to explain the particular problem of the Arab states as "the world's most unfree region" (Schlumberger, 2007, p. 5). Contributors to Oliver Schlumberger's edited volume

consider state–society relations, the structure of the regimes themselves, the interaction of economics and politics, and the interaction of states with the international arena in their search for explanation. The field remains rich in research possibilities.

Directions for Future Research

Areas in which future research will be necessary include, but are not limited to, questions of transitions from authoritarian rule and, conversely, its persistence; state–society relations and the role of civil society under different regime types; civil–military relations; ideology; discourses; propaganda; censorship; and cultural authoritarianism.

Some important issues to explore in the area of transitions and persistence include international pressures and effects. Is there a domino effect for democratization, as U.S. cold warriors once feared regarding communism? Is it possible to impose democracy successfully, as has been attempted in Iraq? What is the role of international institutions and international nongovernmental organizations? Civic culture, or civil society, the presence of public activities, opinion, and organized life outside the control of the state or regime are now considered essential to the healthy functioning of democracy. This has led many donor organizations, governmental and otherwise, to devote considerable resources to building civil society organizations in nondemocratic states, with mixed success, particularly given how easily authoritarian or semiauthoritarian regimes can paint such efforts as sinister “outside interference” (Grodsky, 2007). This is an area in which policy-relevant research is needed.

Economics may also matter a great deal, as it has in 20th-century authoritarianism. What is the relationship between economic liberalization or, conversely, protectionism and political liberalization or authoritarianism? Is it effective to liberalize in one domain but not the other? The question of performance legitimacy in the economic domain persists.

Under the broad heading of state–society relations under authoritarian rule, one key area is civil–military relations, particularly important for societies making a transition away from military rule. Other issues that remain incompletely understood include the effectiveness of propaganda and censorship and the way emerging technologies, particularly in the domain of media and communications, are affecting the ability of regimes to dominate populations and, conversely, the extent to which they might enable the growth of more autonomous and effective civil society organizations.

Conclusion

Nondemocratic regimes persist and offer challenges to political science. They vary widely in institutional structure,

source of legitimacy, ideology, and degree of openness, which makes developing theories of authoritarianism per se difficult. But the core questions of how such regimes arise and stay in power, how they perform, and the circumstances under which they become vulnerable to challenge offer interesting, policy-relevant research pathways susceptible to more than one methodological approach.

SEMIAUTHORITARIANISM

CHRISTIAN GÖBEL¹

Lund University

Semiauthoritarianism denotes a form of government that is neither fully democratic nor fully authoritarian. It might be the result of an authoritarian regime's² having adopted some of the features of a democracy, or of a democracy having restricted political or civil liberties. The term is by no means uncontested. As will be seen below, many other terms exist to describe such regimes that fall into the gray zone between democracy and authoritarianism. However, this chapter is not concerned with terminology but rather with the conceptual issues surrounding the phenomenon of countries' not fitting into the existing tripartite typology of democratic, authoritarian, and totalitarian regimes. In this chapter, the notion of a gray zone will be employed to denote this phenomenon. It is suitable for the purposes of this chapter because it does not make any assertions as to the quality of the regimes discussed (i.e., closer to democracy, closer to authoritarianism, stable, in transition). In addition, it provides a good base to discuss the conceptual challenges inherent in classifying regimes. After all, the size of the gray zone depends on the reach of the concepts employed by the researcher. It is not uncharted territory but territory simultaneously charted by two concepts that should not overlap.

Since the 1990s, the number of countries in this gray zone has undoubtedly increased. Although only about 5% of the world's countries were characterized as "partly free" by Freedom House (www.freedomhouse.org) in 1974, their number had grown to as much as one third by 2007.

Although much (but not nearly enough) empirical knowledge exists about each of these cases, there is a dearth of concepts and typologies that would enable us to group them in ways that highlight their similarities and differences. In fact, *semiautocracies*, *hybrid regimes*, *semi democracies*, and related concepts are but a large residual category in which regimes are placed that are neither genuinely democratic nor genuinely autocratic.

There are good reasons for scholars and students of comparative politics to feel uneasy about the large number of countries that do not fit into the existing tripartite regime typology. The fact that so many regimes eschew easy categorization by means of these classes suggests that serious problems exist with respect to the normative and theoretical assumptions and the concepts that underlie this typology. Add to this the considerable methodological difficulties inherent in gathering, systematizing, and making sense of information on so large and so heterogeneous a population of cases, and it is easy to see that this challenge will keep scholars of comparative politics busy for some time to come. This uneasiness extends to the makers of foreign policy in the developed democracies of the Organization for Economic Cooperation and Development. As a consequence of this lack of information, it is difficult for them to assess whether such regimes do or do not pose a threat to national interests, and to decide on the proper instruments to help these regimes develop and become liberal democracies.

The next section explains the roots of the difficulties just outlined, sheds light on efforts made to characterize and bundle the multitude of cases in the gray zone between democracy and authoritarianism, and introduces the most important concepts brought forth since the 1980s. Then, some empirical evidence is summarized to examine how these concepts have emerged from or are applied to such gray-zone regimes. First, a brief analysis of some relevant indices is provided to illustrate the difficulty of drawing the conceptual line between democracies and autocracies. Second, four of the cases most frequently mentioned in the literature on the topic are briefly introduced: Egypt, Malaysia, Russia, and Venezuela.

Thereafter, the policy implications will be discussed. In particular, from an external perspective, the difficulties this lack of knowledge poses for international democracy support are highlighted. Thereafter, possible avenues and conceptual limits of future research are briefly sketched. The last section summarizes the results and rounds off the chapter with a brief conclusion.

Conceptualizing the Gray Zone

The Origins of the Discussion

Only in the past two decades has the issue of regimes that are per definition neither pure democracies nor pure autocracies become a prominent issue on the agenda of comparative political science. This does not mean that such regimes have not existed before. At the outset of the 20th century, there were quite a number of countries in which reasonably free and fair elections among several candidates or even parties were held, but which could not be considered democratic. These regimes tended to follow, as Larry Diamond (2002) puts it, the “optimal path to stable polyarchy, with the rise of political competition preceding the expansion of participation” (p. 23). In the so-called Third Wave of democracy, which began in Portugal in 1974 and swept across most of southern Europe, Latin America, Asia, Africa, and central Europe within two decades, a large number of regimes did not become liberal democracies, however. In a large number of young democracies (most prominently in Africa and Latin America), human rights violations and military interference in politics was so widespread that many observers hesitated to label these regimes “democratic.” After the breakdown of the Soviet Union, the number of regimes that introduced free and fair elections but retained many authoritarian traits continued to grow. Steven Levitsky and Lucan Way (2002) have identified three paths that led to such regimes. The first two originated in a closed authoritarian regime, which either regressed or collapsed and subsequently adopted democratic institutions, often as a result of internal and external pressure. The third path was the regression of a democratic regime. Subsequently, many of these regimes

proved unable to either progress to democracy or reestablish a closed authoritarian regime. At the time, the overwhelming number of democratization scholars held that these regimes were merely transitory and would soon become true democracies. This “transition paradigm” (Carothers, 2002) started to change around the middle of the 1990s and was seriously questioned by the beginning of the 21st century. A growing number of publications suspected that these “hybrid” regimes were not transitional but displayed remarkable stability.

Conceding that there was no inevitable path to full democracy for regimes that either embarked on democratic transition or improved civil liberties raised the question of how these regimes should be conceptualized. Are they democracies or nondemocracies? As easy as this question may sound, it entails two further questions. First, which concept of democracy should form the basis for this research? And even if we could agree on one concept of democracy, where do we draw the border between democratic and non-democratic regimes?

The Conceptual Difficulty of Separating Democracies From Autocracies

Semiauthoritarian regimes are an unwieldy category because they are defined by what they are not: They are not a democracy, nor are they genuinely autocratic. And since autocracies are also defined by what they are not, that is, a democracy, what is left of the equation is that semiauthoritarian regimes are neither democracies nor nondemocracies. At the same time, however, they display elements of both.

The root of this confusing problem lies in how democracy is conceptualized. Scholars do not agree on what procedural characteristics a regime needs to display in order to be called a democracy. The minimalist *electoral democracy* concept, for example, demands elections that are free, fair, inclusive, and meaningful, which not only entails a real chance for the opposition to come to power, but also presupposes a range of civil liberties such as freedom of organization, freedom of speech, and freedom of information. On the other end of the spectrum are maximalist concepts that, in addition to the characteristics just listed, entail a wide range of civil rights, the absence of veto players not legitimized by democratic procedures, horizontal accountability, and the rule of law.

Different as all these concepts may be, they have two features in common that pose considerable difficulties in the process of separating democracies from nondemocracies: (1) They are made up of several criteria, and all of the criteria are necessary elements of a democracy; and (2) more problematically, most of these indicators relate to phenomena that are not either/or conditions but matters of degree. In consequence, the researcher must decide on artificial thresholds that separate existence from nonexistence of the elements inherent in this concept. For example, how

many persons need to be prevented from voting in order for the condition of universal suffrage to be violated? When exactly do elections cease to be free and fair? As a result of the two features above, further conceptual difficulties emerge: Is the half-fulfillment of two conditions equal to the nonfulfillment of one condition? And is a regime that fails on five of eight conditions less democratic than a regime that fails on only one?

The fact that most people would answer the latter question in the affirmative illustrates the biggest problem with existing regime typologies. Per definition, regime typologies must be able to cover all existing cases, and the classes they establish must be mutually exclusive: Each case must correspond to only one type. This means that if the tripartite typology were a true typology, a gray zone could not exist. That it does exist is attributable to the difficulty of establishing a single threshold for a concept that consists of several criteria, each of which is gradual in nature and therefore necessitates the imposition of an artificial threshold.

Attempts to Solve the Gray-Zone Problem

Three main strategies exist to deal with such gray-zone regimes: Conceptualize them as deficient democracies, as subtypes of authoritarian regimes, or as a genuine regime type (hybrid regimes). It needs to be noted that these approaches are not equal to regime types, and the empirical overlaps between them are considerable. This, of course, is again a result of the conceptual difficulties just outlined.

Diminished Subtypes of Democracy

Arguably the most prolific reaction to the conceptual challenges just outlined is the creation of ad hoc concepts to characterize regimes that share most attributes associated with a liberal democracy but not all. In most cases, the deficiency is expressed with an adjective, resulting in terms such as *tutelary democracy*, *illiberal democracy*, *neopatrimonial democracy*, and *delegative democracy*, to just name a few of the literally hundreds of such concepts that have emerged in recent decades. In their famous treatise on conceptual innovations in comparative politics, David Collier and Steven Levitsky (1997) call these concepts “diminished subtypes” of democracy.

Whereas “classic” subtypes share all the attributes associated with democracy and add other features to arrive at increased differentiation (e.g., parliamentary vs. presidential democracies; consensus vs. majoritarian democracies), diminished subtypes are characterized by the lack of one or more of the defining attributes of a liberal democracy. For example, a regime in which horizontal accountability is absent is not a liberal democracy anymore, but might still be more democratic than an electoral democracy. According to one count, the number of such “democracies with adjectives” (Collier & Levitsky, 1997) went into the hundreds, creating confusion and making systematization

difficult. In a notable contribution, a research team associated with Wolfgang Merkel (Merkel, Puhle, Croissant, Eicher, & Thiery, 2003) sought to clear up this confusion. These researchers formulated a very demanding concept of an *embedded democracy* that consists of five “partial regimes,” that is, elections, public participation, effective power to govern, horizontal accountability, and civil liberties. Merkel et al. (2003) also developed 34 indicators to account for “defects” in these partial regimes, with one type of *defective democracy* corresponding to each partial regime. In this way, they identified four basic diminished subtypes of democracy, namely, *exclusive democracy* (which covers any violation of democratic elections and political participation and therefore combines two partial regimes), *tutelary democracy*, *delegative democracy*, and *illiberal democracy*. In other words, the strategy of extending the root concept of liberal democracy into the gray area by subtracting attributes of the root concept persists. Thereby, the root concept is extended toward or even beyond the minimalist concept of an electoral democracy, and a fluid conceptual boundary encompassing both the minimalist and the maximalist concepts is imposed between democracies and authoritarian regimes, and various “defects” or “deficits” mark the difference between electoral and liberal democracy.

Electoral Authoritarianism

“Electoral authoritarianism” is another way of conceptualizing “institutionalized ambiguity” (Schedler, 2002, 2006b). It follows the suggestion of Juan Linz (2000) not to build subtypes of democracy but rather to rely on subtypes of authoritarianism when charting the gray zone. Andreas Schedler maintains that electoral authoritarianism is different from regime hybridity (see below) because regimes in the former category are “neither democratic nor democratizing but plainly authoritarian, albeit in ways that depart from the forms of authoritarian rule as we know it” (Schedler, 2006b, p. 5). They are different from both electoral democracies, which conduct free and fair elections, and *closed autocracies*, which do not stage multiparty elections. Again, however, it is difficult to draw the line between these regime types, with the result that some of the examples that Schedler gives for electoral authoritarian regimes are also textbook examples in some of the literature on hybrid regimes, notably Russia, Egypt, and Malaysia. The proponents of the electoral authoritarianism concept share the stance that these regimes are semiautocratic by their own choice and not because they lack the capabilities to manage the full transition to democracy. On a conceptual level, these authors shed light on the interplay between political and civil rights, and a distinction is made between *hegemonic* and *competitive* electoral authoritarianism. The former pertains to regimes whose “elections and other ‘democratic’ institutions are largely façades, yet they may provide some space for political opposition, independent media, and social organizations that do not seriously criticize or challenge the regime” (Diamond, 2002, p. 26). In

competitive authoritarian regimes, which Levitsky and Way (2002) categorize as hybrid regimes (see below), “formal democratic institutions are widely viewed as the principal means of obtaining and exercising political authority. Incumbents violate those rules so often and to such an extent, however, that the regime fails to meet conventional minimum standards for democracy” (p. 52). Hence, elections are free but hardly fair, with incumbents seeking to control the outcomes by means such as intimidating opposition candidates, corrupting journalists, vote buying, and ballot-box stuffing.

Hybrid Regimes

Instead of extending the range of cases that the concepts *democracy* and *authoritarianism* cover by including (diminished) subtypes of either regime type, Terry Karl (1995, 2005) proposed to treat hybrid regimes as a unique regime type that combines free and fair elections—but not the other traits of a minimalist concept of democracy—with autocratic elements. In fact, the various conceptualizations of hybrid regimes discussed subsequently tend to be based on the two procedural dimensions of democracy identified by Robert Dahl (1971): contestation for political office and public participation in politics. While hybrid regimes tend to grant many or even most of the political rights necessary for political contestation, they tend to control day-to-day politics by systematically excluding certain social groups; by restricting the rights to participate in politics; or by disempowering parliaments, the judiciary, and other control institutions. Often, a relaxation of political rights leads to a tightening of civil liberties, and vice versa.

However, elections are not the only realm in which contestation in *competitive authoritarianism* is played out. As Levitsky and Way (2002) point out, three more arenas are involved. First, in the legislative arena, the opposition can use the legislature as a platform to organize and voice dissent even if it is unable to seize political power. Second, in the judicial arena, judges are often formally independent and can challenge incumbents by declaring a referendum illegal, sanctioning electoral fraud, or protecting the media. Naturally, the incumbents will seek to co-opt or intimidate judges, but such action can be costly in terms of regime legitimacy. Third, the media in competitive authoritarian regimes often enjoy limited or even complete freedom to report on controversial issues and can serve as watchdogs exposing government malfeasance or as mouthpieces of the opposition. As is the case with the judicial arena, the incumbents tend to apply more subtle means than do closed authoritarian regimes for suppressing media freedom.

Marina Ottaway (2003) has added a further important arena, namely, that of gaining public support. The most obvious way of doing so is generating *output legitimacy* by means of providing public services or stimulating economic growth. Where this option is not available (most of the hybrid regimes are developing countries), leaders can rely on personal charisma, co-opt potential opposition by

means of patronage networks, or portray themselves as guarantors of stability, security, and the national interest. A number of later studies confirm that public opinion is indeed an arena that should not be neglected in the analysis of semiauthoritarian regimes.

In a broad manner and almost by intuition, hybrid regimes are often conceptualized as nearer either the autocratic end of the spectrum of political regimes (semiauthoritarian regimes) or the democratic end (semidemocracies). Although such a denomination might be the result of a more or less value-free analytical assessment of the number of democratic preconditions fulfilled or not fulfilled, some authors introduce a normative element to justify their labels. They point out that democracy has today become the only legitimate form of government and that international pressure on nondemocracies to become liberal democracies is rising.³ Because of this, they argue, many authoritarian regimes introduce democratic features (such as elections) to mask their authoritarian character. Hence, Diamond (2002) claims that “virtually all hybrid regimes in the world today are quite deliberately pseudodemocratic” (p. 24). In a similar vein, Ottaway (2003) holds that a defining feature of semiauthoritarian regimes is that “they are carefully constructed and maintained alternative systems” (p. 7). According to Ottaway, such regimes need to be distinguished from countries that are still in transition to democracy and those that strove to become democratic but failed. Although theoretically relevant, it is difficult to ascertain whether a regime is in a protracted transition, has failed to democratize, or is semiauthoritarian by choice. With respect to semiauthoritarian regimes, Ottaway proposes a subdivision into three types of semiauthoritarian regimes. “Semiauthoritarian regimes in equilibrium,” for which she cites Egypt as a textbook case, “have established a balance among competing forces” (p. 20) and are therefore able to persist for a long time. “Semiauthoritarianism in decay” (p. 20) denotes regimes that are regressing toward full authoritarianism, such as Azerbaijan, or from democracy to semiauthoritarianism, such as Venezuela, and that tend to be much more unstable than semiauthoritarian regimes in equilibrium. “Semiauthoritarian states undergoing dynamic change” (p. 20) form a third category and comprise regimes verging on democratization. Ottaway’s examples are Senegal and Croatia, although Senegal was showing, to apply Ottaway’s terminology, signs of “decay” when this chapter was written.

As can be seen from the above discussion, the term *semiauthoritarian* is frequently used as a residual category to cover diminished subtypes of democracy and electoral authoritarian regimes as well. Only at the end of the first decade of the 21st century did the more systematic study of hybrid regimes as a distinct regime type pick up. For example, building on the competitive authoritarianism concept formulated by Levitsky and Way (2002), Joakim Ekman (2009) created a profile of hybrid regimes based on six criteria, namely competitive elections (a minimum condition to be fulfilled in order for a regime to be classified as hybrid), significant levels of corruption, lack of democratic quality, a

problematic press freedom situation, a poor civil liberties situation, and lack of the rule of law. According to Ekman, the more of these criteria that are met, the closer the regime verges on authoritarianism.

In a similar fashion, Heidrun Zinecker distinguishes democracies, autocracies, and hybrid regimes by means of five “partial regimes,” that is, civil rule, polyarchy, rule of law, civilizedness, and political exclusion/inclusion. If none of these conditions is fulfilled, the regime is authoritarian, and if all are fulfilled, it is a democracy. Hybrid regimes are characterized by the presence of at least civil rule and polyarchy, and the nonfulfillment of at least one of the three other conditions. Of particular importance for Zinecker is the exclusion/inclusion dimension, for it functions as a link between regime characteristics and issues of socioeconomic transformation. According to Zinecker, the democratization of a hybrid regime requires the transformation not only of political but also of socioeconomic institutions.

Finally, Leonardo Morlino (2009) straightforwardly argues that conceptualizing hybrid regimes as a genuine regime type can be justified only if it can be proven that regime hybridity is not a transitory phenomenon. For him, only those countries that have been “partly free” in the Freedom House survey for at least 10 years qualify as hybrids. In a way similar to that of Zinecker (2009), Morlino classifies these regimes on the basis of “seven ambits that are important when analyzing any political regime” (p. 290), that is, rule of law, electoral process, functioning of government, political pluralism and participation, freedom of expression and beliefs, freedom of association and organization, and personal autonomy and individual freedom, and arrives at three types of hybrid regimes: *quasi democracies*, *limited democracies*, and *democracies without state*.

Advantages and Disadvantages

Each of the approaches outlined above has advantages and disadvantages. The advantages of creating diminished subtypes are that the perceived deficiencies of individual regimes are highlighted and that democracy can continue to serve as the root concept if a regime is perceived to verge closer to democracy than to authoritarianism. However, there are several notable disadvantages in this strategy. First, some scholars argue that it is unethical to classify one third of the countries in this world by what political scientists perceive to be not their special traits, but their deficits. The more serious disadvantage, however, is the conceptual dilemma this strategy poses. In terms of the strict demands of a typology, since these “diminished subtypes” do not possess all the necessary attributes prescribed for a regime to be called a liberal democracy, they should not be called democratic if liberal democracy is the root concept. In this case, it might be better to take electoral democracy as the root concept and create categorical subtypes.

The concept of electoral authoritarianism seems to solve both these problems. It represents a categorical subtype of authoritarianism that is juxtaposed to a minimalist concept of an electoral democracy. However, it does not address the problem of how to classify those regimes that are democracies but not liberal democracies. Clearly, the strategy of creating diminished subtypes of democracy cannot be applied anymore if the root concept is not a liberal but an electoral democracy. Hence, nonliberal democracies cannot be conceptualized anymore on the basis of the deficits ascribed to them, and entirely new subtypes building on positive or neutral characteristics would have to be created. This is more difficult than it seems.

Treating “hybrid regimes” as a distinct regime type does not solve, but rather dodges, this problem. The concepts presented by Ekman (2009) and Zinecker (2009) allow researchers to broadly measure a hybrid regime’s relative distance from democracy and authoritarianism, and they allow scholars to cluster hybrid regimes around different dimensions that, however, again point to deficits. The more explicit classification proposed by Morlino exemplifies this dilemma. His typology again yields “democracies with adjectives” (Collier & Levitsky, 1997).

Empirical Evidence

Quantitative Evidence

As the previous sections should have made clear, the number of gray-zone regimes depends on the democracy concept applied as well as its operationalization. This pertains to electoral authoritarianism as well because, as pointed out above, authoritarianism is defined as the absence of democracy. This section compares several assessments regarding the number of “hybrid regimes.”

Based on the Freedom House index, which is one of the most popular indices for classifying political regimes, Diamond (2002) counts 73 liberal democracies, 31 electoral democracies, 17 ambiguous regimes, 21 competitive authoritarian regimes, 25 hegemonic electoral authoritarian regimes, and 25 closed authoritarian regimes for the year 2001. If we count as hybrid regimes those that are neither liberal or electoral democracies nor closed authoritarian regimes, the number comes to 62 (far more than one third out of a sample of 167 countries). If hegemonic authoritarian regimes are excluded, almost one fourth (38 regimes) can be classified as hybrids. This tallies well with the Economist Intelligence Unit’s Democracy Index for 2008, which lists 36 out of 167 regimes covered as “hybrid” (p. 2), and Morlino’s findings, which identify 35 hybrid regimes. According to Diamond, the largest percentage of hybrid regimes is found in sub-Saharan Africa, where 27 (17) out of 48 regimes are neither liberal nor electoral democracies nor closed authoritarian regimes (the number in parentheses, in this sentence and below, is the number of hybrid regimes when hegemonic electoral

authoritarian regimes are subtracted). In the Middle East and North Africa, 10 (4) out of 19 fall into this category, 12 (7) out of 27 in the post-Communist regimes, 7 (3) out of 25 in Asia, and 6 (5) out of 33 in Latin America and the Caribbean. According to Ekman's index, 30 countries fulfill at least the minimum criterion of competitive elections and can therefore be classified as hybrid regimes. Russia and Venezuela are positive on all indicators and are therefore the hybrid regimes closest to authoritarianism, whereas Romania and Croatia are positive on only one indicator and are therefore closest to democracy. Although the number of hybrid regimes in all the indices mentioned so far does not differ much if hegemonic authoritarian regimes are excluded from Diamond's typology, there is no consensus on which regimes qualify as hybrid and which do not. A comparison of the indices just introduced yields great variation.

Case Studies

Although, as pointed out above, gray-zone regimes are very different from each other, the different combinations of democratic and authoritarian traits are illustrated in this section by means of four brief case studies. This analysis follows the "competitive authoritarianism" concept and examines the four arenas identified by Levitsky and Way (2002), augmented by the public support dimension identified by Ottaway (2003). The emergence and traits of competitive authoritarianism are outlined for Egypt, Malaysia, Russia, and Venezuela because these four cases figure prominently in the debate, they represent four of six continents, and they display remarkable differences with respect to their "hybridity." As a preface to the case studies, the next two paragraphs briefly shed light on the history of regime hybridity in each case.⁴

Egypt and Malaysia can both be characterized, in Ottaway's terms, as "institutionalized" semiauthoritarian regimes. The institutional base of semiauthoritarianism in Egypt was built under Anwar el-Sadat in the 1970s. He replaced the military regime of his assassinated predecessor, Gamal Abdel Nasser, with a presidential system that nominally guaranteed political and civil rights. In Malaysia, a race riot in 1969 ended the democracy inherited from the British colonizers after the country's independence in 1957. After an 18-month state of emergency, the ruling United Malays National Organization reorganized itself, and gradually a regime combining authoritarian and democratic elements was set up. One crucial difference between the two countries is that in Malaysia, leadership succession took place under the auspices of the former leader, whereas leaders in Egypt remained in power as long as they were alive.

In contrast to these long-standing regimes, Russia's and Venezuela's semiauthoritarianism emerged only in the late 1990s. Again, there are crucial differences between these two cases. In the Russian Federation, semiauthoritarianism gradually replaced an authoritarian regime after

the collapse of the Soviet Union. Semiauthoritarianism was most visibly engineered under Vladimir Putin, who had succeeded the ailing Boris Yeltsin as president of the Russian Federation in late 1999. Whereas Putin arguably had an incumbent advantage in the 2000 presidential elections, the former Venezuelan army colonel Hugo Chavez had not been in office when he won the 1998 presidential elections in Venezuela. However, he was well-known for his leading role in a 1992 coup attempt.

Of the four regimes described here, only Venezuela had the status of an "electoral democracy" in the Freedom House survey, which it lost, however, in 2009 (<http://www.freedomhouse.org/uploads/fiw09/FIW09Tables&GraphsForWeb.pdf>). Until then, opposition parties and candidates were allowed to organize and compete in presidential and parliamentary elections. They had a real chance of winning, but the playing field was not level. As a result of the media restrictions discussed below, Chavez and his followers receive better and more benevolent media coverage, and government resources are used to shore up support in election campaigns. In addition, Chavez's staffing of the National Electoral Council and the use of fingerprint identification equipment have shored up allegations of irregular election procedures because they allegedly allow authorities to connect voters to their ballots. In the other three cases, the opposition is similarly disadvantaged in media coverage, resource endowment, and election procedures and faces additional difficulties. In Malaysia, the electoral system favors the ruling Barisan Nasional. In addition, electoral rolls are frequently manipulated, districts are gerrymandered, and party organization and campaigning are restricted. Nevertheless, opposition parties have been able to win the gubernatorial elections in individual provinces. In Egypt, strict party registration rules, high thresholds for presidential candidates, and electoral manipulation have made it virtually impossible for opposition candidates to contest the presidency. The same is true of Russia, where state-controlled media, high thresholds for candidates, and intransparent elections have made elections increasingly less competitive.

The independence of the judiciary is severely limited in all four countries. In Egypt, the Ministry of Justice controls promotions and compensations for judges, giving the executive undue influence over the judiciary. In addition, exceptional courts appointed by the president try security cases, and the Emergency Law allows the arrest of political activists. Corruption and executive interference hamper judicial independence in Malaysia, Venezuela, and Russia. However, the courts are not entirely dysfunctional in any of the cases.

Freedom of information in Egypt is severely hampered by government ownership of all terrestrial television stations, the licensing requirements for newspapers, and a state monopoly on the printing and distribution of newspapers. In addition, criticism of state authorities and organizations is discouraged by means of defamation suits. The

Russian and Malaysian governments apply similar tactics. Although not unheard of in Russia and Egypt, intimidation is the main form of influencing journalists in Venezuela. However, with the Law on Social Responsibility of Radio and Television, passed in 2004, and the refusal to renew the licenses of critical media, the Chavez administration has started to resort to censorship as well.

As for public support, it is important to note that with the possible exception of Egypt, the strongmen in all four cases have enjoyed genuine popular support. In Venezuela, this support recently started to dwindle, which prompted Chavez to further restrict civil liberties. Similar processes are at work in Malaysia, where regulations banning Muslim conversions to Christianity fueled popular unrest, which was in turn answered with arrests and a media crackdown. Putin has not yet had to face such challenges.

Implications for Democracy Assistance

As the chapter so far has shown, semiauthoritarian regimes can endure for a long time. Given that in such regimes, persons are more important than institutions, it is extremely difficult to predict how a semiauthoritarian regime will react to internal or external crises such as severe economic downturns or the death of a paramount leader. Such a crisis might well lead rival elite groups into a struggle for succession, with potentially negative impacts on the well-being of the population and regional stability. For these reasons and the normative conviction that democracy is the best of all regime forms, governments and civil society organizations in Western industrialized states seek to assist democratization in such countries.

As the above sections should have made clear, however, the study of gray-zone regimes is still in its infancy. Considerable headway is being made with regard to concept formation and regime classification, but a theory of hybrid regimes that could guide democracy assistance does not yet exist.⁵ For this reason, the relationship between democracy assistance and semiauthoritarian regimes is characterized by three major paradoxes that are very difficult to resolve. First, as Ottaway (2003) points out, democracy assistance is one of the major reasons that such a large number of semiauthoritarian regimes emerged in the first place. Development aid and inclusion in international regimes is frequently tied to demands for democratization, which has prompted many authoritarian leaders not to commit to democratization, but to set up democratic façades. Second, democracy assisters demand that semiauthoritarian rulers become accountable to their people but at the same time require these rulers to be responsive to the donor community. More emphasis is placed on the implementation of externally prescribed best practices than on generating homemade solutions in often messy democratic politics. This, one must add, is especially true for those regimes that are dependent on outside economic assistance. Third, given the lack of knowledge about such regimes and the resulting lack of systematic strategy on the side of the donor

community, democracy assisters can never be sure whether their well-meant interference will contribute toward democratizing the regime in question, have no impact at all, or even help extend authoritarian rule.

To overcome these paradoxes, democracy promoters face two major decisions. The first is whether the regime should be changed by means of exerting pressure on the incumbents, propping up the opposition, and (re)designing legal, administrative, and representative structures. The underlying logic is that even if not much is known about the causes for the existence of such regimes, at least the symptoms of authoritarianism can be addressed. Although this approach has the potential to change a regime, it also necessitates the commitment of substantive funds over a long time and runs the great danger of fomenting disorder and even civil war if the intervention fails. The alternative would be less invasive attempts to improve existing structures. This approach might help improve organizational and administrative capacities and the level of education, yet these often are not what the opposition lacks in a country where leaders are simply reluctant to give up power.

The second decision closely relates to the first one and pertains to the instruments and targets of democracy promotion. Again, the lack of knowledge about hybrid regimes makes it difficult to assess the impact of particular instruments on the regime in question. According to Ottaway, global democracy promotion not only tends to avail itself of the same terminology and narratives concerning the benefits of democracy but also tends to prescribe very similar recipes in very different contexts. Among these recipes are election monitoring, propping up civil society organizations, training journalists, and educating the population on the virtues of democracy. However, these strategies, which aim at thwarting the “games semiauthoritarian regimes play” (Ottaway, 2003, p. 137) in the realms of electoral, legislative, and judicial procedures, in the media, and in public support, have proven to be of only limited usefulness. As Zinecker suggests, what are also needed are attempts to remedy the structural factors that brought such regimes into power in the first place.

For example, democracy is very difficult to establish in countries with societies polarized along ethnic or income lines, those with low income standards, those still in the process of state formation, and those where a powerful opposition against the ruling regime does not exist. In addition, the rulers, the opposition, and the general population must be convinced that democracy is indeed the regime form best suited to overcome these difficulties. This, according to Ottaway, necessitates linking politics and policies, which means that democracy assistance should refrain from prescribing outcomes in the form of best practices while at the same time demanding that democratic procedures are followed.

A precondition for establishing a democracy is that rulers can be either convinced or coerced to refrain from manipulating political outcomes, which in turn necessitates either a reformist leadership or a strong opposition willing to follow democratic procedures. In such cases, the chances

for success are best if demands for support come from the regime and are not imposed from the outside. In general, the tools applied to promote democracy must be applied in a context-sensitive manner, which requires intimate knowledge of the case in question. Of general relevance are issues such as whether semiauthoritarianism has persisted for a long time and is likely to persist, the relationship between incumbents and opposition, the (non)existence of likely collaborators in civil society, the regime's (in)dependence on outside funding, the socioeconomic situation, the degree of social cohesion, the quality of existing regime structures, the level and features of corruption, experience with democratic procedures, and so on. This list shows that there are no easy solutions, and it is here that improved knowledge about different types of hybrid regimes and their internal dynamics is clearly necessary in order to design better policies to deal with the challenges emerging from such regimes.

Directions for Future Research

As the preceding sections have shown, the study of gray-zone regimes is still a young and evolving discipline. Future research will have to address three broad issues: conceptual, contextual, and causal. With respect to the first issue, four major roads can be imagined to tackle the dilemma of having to impose an artificial threshold on phenomena that are matters of degree rather than type. First, conceptualize regimes exclusively in degrees, which, however, would in its final consequence mean that the three-part typology in its present form would have to be given up and that one or more gradual concepts extending across all regime forms would have to be found. Second, conceptualize regimes exclusively in types, which would necessitate the creation of a multitude of indicators to capture not only the basic regime types but also their manifold variations. This would be the highly impractical political science equivalent of squaring the circle. Third, further pursue the practice of establishing an artificial threshold between democracies and autocracies while conceptualizing each regime type's quality as a continuum. As seen above, the drawback of this strategy is that it works only with minimalist concepts. The more demanding the concepts become, the larger the gray zone in which they overlap becomes. Thus, most promising is the practice of applying a minimalist concept of an "electoral democracy" and carefully separating it from "electoral autocracies." Fourth, further pursue the third strategy and deal with the gray zone by conceptualizing it as a distinct regime type.

With respect to either strategy, another dilemma has to be addressed when applying these concepts to concrete cases. On one hand, both small-*N* and large-*N* comparative studies have to be based on uniform criteria that allow the researcher to make inferences that transcend these cases. On the other hand, such analysis must take heed of the problem that in different settings, different forms of violating democratic principles might be applied. For example,

whether an election is free and fair has to be decided from case to case because the methods used to influence elections differ and cannot be specified a priori. Hence, the study of hybrid regimes needs to be conceptually and methodologically sound and contextually informed.

A final desideratum for further research concerns questions of causes and effects. This applies especially if the gray zone is classified as a distinct regime type. For example, in what ways do hybrid regimes come about, and how does this history influence their stability? What role do domestic factors such as political culture, the socioeconomic background, and the character of the regime play? Are certain types of hybrid regimes more stable than others? Does a specific regional environment promote the formation of hybrid regimes? And are hybrid regimes harmful to regional stability? In sum, what needs to be developed in the years to come are theories that address these questions.

Conclusion

Semiauthoritarianism represents a true challenge for comparative politics because theories that explain the genesis and impacts of semiauthoritarian or hybrid regimes on regional and domestic stability do not yet exist. The vast amount of work on the subject is still conceptual in nature. This is one of the reasons that international support for democracy faces such great difficulties in picking the right instruments. Comparative politics has begun only very recently to systematically conduct research on such regimes, which truly makes semiauthoritarianism a topic for political science in the 21st century. The conceptual foundation of the existing tripartite regime typology is the root of the difficulties inherent in such theory building, and three different strategies to overcome these difficulties have been introduced in this chapter. In addition, a number of indices have been examined to gauge the number of such regimes existing in the world. Finally, Egypt, Malaysia, Russia, and Venezuela were compared to tease out the similarities in the ways they limit elections, stifle parliamentary and judicial activity, and constrain press freedom, but nevertheless gain a modicum of support. However, these regimes also illustrate important differences with regard to their historical origin, their duration, and the instruments their leaders utilize to stay in power. Future research can pursue a number of promising paths, and this chapter has aimed to enable the reader to gain a better understanding of the challenges involved in theorizing semiauthoritarian regimes. It is hoped that the theoretical and practical relevance of conducting such research has become obvious.

Notes

1. I am indebted to David Kühn and Julia Leininger for their useful comments and suggestions.
2. The term *regime* denotes "the set of government institutions and of norms that are either formalized or are informally

recognized as existing in a given territory and with respect to a given population" (Morlino, 2009, p. 276).

3. At the time of writing, a new line of scholarship has become devoted to exploring whether powerful authoritarian regimes such as China and Russia actively contribute to establishing authoritarianism as a legitimate alternative to democracy.

4. The analysis is based on the Freedom House Country reports for the year 2008. Additional information on Malaysia was obtained from Case (2002).

5. A partial exception is Zinecker (2009), who suggests that hybrid regimes where rent economies predominate can be democratized by the marketization of the economy.

MODELS OF DEMOCRACY

JOHN T. ISHIYAMA, TATYANA KELMAN, AND ANNA PECHENINA

University of North Texas

This chapter examines the various ways in which democracy has been conceptualized: in other words, *models of democracy*. Although the term *democracy* has often been used in the literature, there has not always been consensus as to its meaning. The literal meaning of democracy comes from a combination of two Greek words, *demos* (people) and *kratos* (rule; Robertson, 1985), and at its core, “Democracy is a form of government in which the people rule” (Sørensen, 1993, p. 3). The term originated in Athens and was a part of the standard classification of “regime forms that distinguished rule by one (monarchy), several (aristocracy), and the many (democracy)” (Miller, 1987, p. 114).

However, beyond the literal meaning of democracy, there has been considerable debate over the criteria that distinguish democracies from nondemocracies. A relatively narrow definition of democracy has been offered by Joseph Schumpeter (1950), who viewed democracy as simply a method for choosing political leadership: “The democratic method is that institutional arrangement for arriving at political decisions in which individuals acquire the power to decide by means of a competitive struggle for the people’s vote” (p. 260). Another, more exclusive definition is offered by David Held, who argued that “democracy entails a political community in which there is some form of *political equality* among the people” (Held, 1996, p. 1). The existence of

equal rights (and, accordingly, equal obligations) is the principal feature of political democracy.

Between the rather inclusive conception of political democracy offered by Schumpeter and the exclusive definition offered by Held is that offered by Robert Dahl (1989). For Dahl, *democracy* was an ideal type of political system in which citizens have the opportunity to (a) formulate their preferences, (b) signify their preferences to their fellow citizens and the government, and (c) have their preferences weighed equally in the conduct of government. However, since no system can fully embody democracy as an ideal type, Dahl prefers to use the term *polyarchies* to refer to existing “nonideal” democracies. Polyarchies exhibit the following characteristics:

1. Control over government decisions is constitutionally vested in elected officials.
2. Elected officials are chosen in free, fair, and frequent elections.
3. Practically all adults have the right to vote in elections.
4. Practically all adults have the right to run for elective offices.
5. Citizens have the right to express themselves freely on political matters.
6. Alternative sources of information are freely and legally available.
7. Everyone has the right to form parties, pressure groups, and other associations independent of the state. (Dahl, 1989)

One could distinguish empirically between different kinds of polyarchy in terms of two dimensions: competition for office and political participation. Systems that approach the democratic ideal (polyarchies) are characterized by high degrees of competition and high degrees of participation. Systems that have lower degrees of competition and participation are more autocratic.

However, critics of this approach argue that this conceptualization is “static” and cannot distinguish between democratic and nondemocratic regimes, but only among varying degrees of polyarchy. Furthermore, this conceptualization of democracy cannot identify how democracies emerge from nondemocratic regimes, as has occurred in most European countries. What Richard Rose, William Mishler, and Christian Haerpfer (1998) prefer is the “democracy in competition” approach to conceptualizing democracy, or the notion that democracy is defined not relative to an ideal, as is polyarchy, but relative to nondemocratic alternatives. Thus Rose et al. opt for a definition based on Juan Linz and Alfred Stepan (1996), who identify four characteristics of central importance in characterizing any regime: the rule of law, the institutions of civil society, free and fair elections, and the extent to which governors are held accountable. *Rule of law* means that no individuals, including rulers, stand above the law. *Civil society* relates to the existence of sociopolitical groups, autonomous from the state, that allow for the free articulation of popular interests and keep in check the uncontrolled growth of the state (see Diamond, 1994; Fine & Rai, 1997). *Free and fair elections* refers to the existence of real competition for office. And *accountability* refers to the extent to which those who govern are responsible to others for their political actions. None of these criteria individually is sufficient to define a democracy, or any other regime for that matter. Only in combination do these characteristics define different kinds of regimes.

Perhaps one way to combine these two very different conceptions of democracy is to think of them as measuring two very different things. On one hand, the Dahlian definition of *polyarchy* is useful in distinguishing between different varieties of democracy. Some systems are closer to the democratic ideal than others are. On the other hand, the conception of democracy favored by Rose et al. (1998) and Linz and Stepan (1996) provides the minimalist criteria for democracy and is useful in distinguishing not only democracies and nondemocracies but also regimes that are *democratizing*. From this conception, we can identify the minimal thresholds that countries pass in order to qualify as democracies—the rule of law, the development of the institutions of civil society, the existence of free and fair elections, and the extent to which those who govern are held accountable. In order to gain a comparative understanding of existing political systems, we need to account for differences between countries that have already passed the minimal thresholds that qualify them as democratic (e.g., differences in levels of participation and competition) and those countries that have only partially met the minimal

criteria for democracy, are approaching the minimal criteria, or are very far away from the minimal criteria.

If this is what we mean by democracy, what, then, do we mean by the process of democratization? *Democratization* is the process by which societies develop toward democracy. Some, like Freeman and Snidal (1982), define democratization as the extension of citizenship and the franchise. Yet this presupposes that meaningful elections take place and that political elites will abide by outcomes of such elections, which implies at least the notion that a rule of law exists and that leaders are accountable to someone. On the other hand, if we consider the minimal definition of democracy as the rule of law, the development of the institutions of civil society, the practice of free and fair elections, and the establishment of accountability of those who govern, then democratization is the process by which the rule of law, elections, and leadership accountability are established and through which civil society develops. Once established, the *expansion of democracy* involves extending the degree of competition and participation through such mechanisms as broader enfranchisement (participation) and greater competition.

To illustrate the various approaches to democracy below, this chapter deals first with some classic approaches to democracy, particularly how the “ancients” approached the concept, the idea of participatory, or direct, democracy, and then republican, or representative, democracy. It then turns to the work of more contemporary scholars, who have sought to identify the different forms that political democracy can take, especially polyarchy, majoritarian democracy, consensual democracy, consociational democracy, delegative democracy, deliberative democracy, and democratic autonomy. Last it discusses Arrow’s impossibility theorem as it relates to democracy.

Classic Approaches to Democracy

The Ancients and Democracy

The earliest conceptions of democracy are associated with the ancient Greeks. A number of factors contributed to the development of the democracy in Athens. The polis, or city-state, served as a basic unit of operation in Greece and was built on largely egalitarian values. These values were supported by three key factors.

First, the connection of lower-class citizens to the military allowed them to better their socioeconomic status, as well as to get involved in communal decision making. Second, as the Athenian polis moved toward being a “world power,” the old institutions of governance and the distribution of power were questioned. This led to a question of who should be in charge of the polis and “what role the people should play in the decisions that directly affected their safety and future” (Boedeker & Raaflaub, 1998, p. 20).

Third, the empire generated a considerable amount of income, which accumulated and allowed for extra spending

on domestic programs rather than only military. Having a steady source of income encouraged such spending, leading to “Athenians’ decision to introduce pay for juries and eventually for other political offices” (Boedeker & Raaflaub, 1998, p. 20)—an unprecedented development. However, Greek democracy was limited to freeborn male citizens with property (Thiele, 2003).

Classical scholars such as Plato and Aristotle debated the usefulness and “goodness” of pure democracy. Sometimes it was viewed as a conventional form and “sometimes as a corrupt form of popular rule in the . . . classification that included tyranny as the corrupt form of monarchy, oligarchy as the corrupt form of aristocracy, and ochlocracy as the corrupt form of government by the people” (Miller, 1987, pp. 114–115).

Plato is considered to be an opponent of democracy, even though he was a follower of the political thought of Socrates, who was believed to be a “friend of democracy and a champion of open society” (Ober, 1998, p. 156). The reason for this notion lies in Plato’s idea that democracy elevated the pursuit of freedom to the highest possible level, which ultimately leads to multiple breakdowns in the order of the society. Thus, he prefers the monarchical rule of philosopher kings (Thiele, 2003). Aristotle, a student of Plato’s, agreed with Plato that monarchy, ruled by philosopher kings, is the best possible regime. However, he realized that such a regime is impossible to maintain.

For Aristotle, democratic politics are about ruling and being ruled at the same time. Aristotle lays out three “ideal” types of regimes: monarchy, aristocracy, and polity. The corrupt counterparts of these “ideal” regimes are tyranny, oligarchy, and democracy, respectively. As was noted, monarchy was seen by Aristotle as an unstable regime that was quick to turn into tyranny, and thus, although it was the most preferred type, it was not very practical. Aristocracy is rule by the virtuous, and it turns into oligarchy if not maintained properly. Polity is the best practical regime and is a mix of aristocratic and democratic principles (Thiele, 2003).

Participatory Democracy and Direct Democracy

Although the ancients were suspicious of mob rule, the idea of participatory democracy, or direct democracy, has its roots with them. Participatory democracy, or direct democracy, can be traced back to Athens, Greece (460 BCE), where the direct rule of government was done by the people (i.e., *demokratia*) and not via an elected group of representatives (Foot, 2009). The Athenian city-state adopted this form of political system to provide its citizens an opportunity to directly participate in the state’s decision-making process. Through an assembly, citizens could directly decide and vote on “public policies that [would] govern their behavior” (Mezey, 2008, p. 1). Although the Athenian democratic form of government lacked the right of women and of slaves to vote, it still provided all adult male citizens with an increase in control over their “own

lives by allowing them to directly determine how public power [was] exercised” (Fung, 2003). As such, since there were no “representatives in the Greek system of government,” sovereignty over the laws lay primarily with male citizens, who “ruled themselves directly” (ThinkQuest Team 26466, 2009).

Currently, Switzerland and some New England town meetings closely resemble participatory democracy or direct democracy. Switzerland has 23 states, known as *cantons*, three of which are divided and known as *half cantons*. These half cantons function as full cantons by having their own constitution and legislative, executive, and judiciary branches. However, two of the half cantons perform functions that resemble the Athenian city-state political system: All adult citizens participate in the decision-making process, as in participatory democracy. The rest of the Swiss cantons use a system of representatives elected directly by citizens and who act on behalf of those citizens, constituting a republic, or a representative democracy. Most of the countries in the world today resemble a republic, or a representative democracy.

Some argue that although participatory or direct democracy allows citizens to rule themselves directly, the model may complicate and slow down the overall decision-making process (Mezey, 2008). Many critics also point out that in a direct democracy, citizens are not capable of being informed on all issues and thus are not capable of implementing various policies appropriately, and so they may instead rely on self-interest in making those decisions (Mezey, 2008). Among the many forms of democracy that have developed since the Greek and Roman civilizations, participatory or direct democracy is regarded as the type closest to the ideal form of democracy that provides citizens with full and direct participation in the decision-making process of their government (Mezey, 2008).

Republicanism, or Representative Democracy

Republicanism, or representative democracy, is also rooted in the work of the ancients. Beginning in the fifth century BCE, Romans, inspired by the Greek system of government, developed a new form of government called *republicanism* (also known as *representative democracy*) to accommodate their ever-growing population (Foot, 2009).

The difference between the Greek and Roman forms of democracy lies in the election of representatives. Specifically, in the Roman form of democracy, governmental decisions are made by an elected group of representatives (Mezey, 2008). These elected representatives “consider policy alternatives, and decide by vote” among themselves in accordance to the views of their constituents (Mezey, 2008, p. 1). In other words, in this form of government, (a) public policy is made by a representative of the citizens and not by the citizens themselves; (b) representatives are elected by citizens from groups called constituents; (c) adult citizens are able to cast a vote, and each citizen has one vote; and

(d) representatives are “accountable for their actions to those who elect them and can be replaced by next elections” (p. 2). Specifically, citizens indirectly impact political decisions by “electing and influencing the behavior of representatives who actually make public policy and control implementation” (p. 2). For example, James Madison, a founding father of the United States, and philosophers such as John Locke and Alexis de Tocqueville preferred and advocated this form of representative government, in which decisions were not made directly by citizens but were made by their elected and knowledgeable representatives. These philosophers believed that this system of representation would prevent citizens from resorting to self-interest during their decision-making process (Yarbrough, 1979).

It is important to mention that Madison aligned republicanism with representation (Yarbrough, 1979). Madison defined the republican government as one that must be democratic but not to the point that public matters must be “conducted by the citizens in person” (Yarbrough, 1979, p. 62). In general, “elected representatives would protect the right of the people better than the people themselves” (p. 62). The United States’ current system of government best resembles this form of democracy. Currently, countries such as the United Kingdom, Germany, Canada, the Netherlands, and Belgium also use this form of democracy as their governing system.

Contemporary Models of Democracy

Polyarchy

The idea of polyarchy is associated with the U.S. political scientist Robert Dahl, who was seeking an empirical way in which to measure the concept (in keeping with the introduction of the scientific method in political science as a result of the behavioral revolution in the 1950s and 1960s). In his 1963 book, *A Preface to Democratic Theory*, Dahl defined *polyarchy* as “an open, competitive and pluralistic system of minority rule” (cited in Krouse, 1982, p. 422). Dahl argued that polyarchy is “a necessary condition and foundation of democracy” (cited in Bailey & Braybrooke, 2003, p. 109). Dahl argued that “power in American politics is pluralistic,” and therefore government must account for the diversity in the population (cited in Bailey & Braybrooke, 2003, p. 103).

In his 1990 book, *After the Revolution: Authoritative Good Society*, Dahl looked at the purpose and function of polyarchy as a method of decision making (Dahl, 1990). Specifically, he emphasized that polyarchy provides greater political equality and popular sovereignty and as a democratic model best reflects participation in our modern or pluralistic society. Dahl argued that polyarchy is the basis for democracy. He also argued that pluralism is necessary, inevitable, and desirable in a polyarchy and that diversity provides individuals with more choice and leads

to self-understanding. Polyarchy is seen as the product of freedom and as generally good for human beings (Dahl, 1990). Dahl describes polyarchy as a product of democratizing nation-states and not like direct democracy as seen in ancient Athens. Polyarchy is more similar to republicanism, or the representative form of democracy.

According to Dahl, polyarchy is pivotal to the establishment of the democratic process. In his works, Dahl refers to polyarchy as a regime that must require the presence of seven political institutions in order to exist: elected officials, free and fair elections, inclusive suffrage, (an inclusive) right to run for office, freedom of expression, alternative sources of information (freedom of media), and associational autonomy (freedom of association; Bailey & Braybrooke, 2003, p. 107). In his 1972 book, titled *Polyarchy: Participation and Opposition*, Dahl emphasizes that these political institutions of polyarchy are necessary for the attainment of democracy but that ideal democracy does not exist currently in the world (Dahl, 1972). In other words, polyarchy is an imperfect, real-world substitute for full democracy (Bailey & Braybrooke, 2003, p. 107).

An important feature of polyarchy is that it promotes competition and toleration. Specifically, polyarchy accepts and tolerates a variety of views and, as such, equips citizens with an opportunity to express their opposition. Opposition parties and associations of all kinds are “good and natural” in polyarchy (Bailey & Braybrooke, 2003, p. 108). Therefore, the freedom of association and an ability of interest groups to influence governmental decision-making processes are widely accepted and encouraged in polyarchy.

Furthermore, Dahl interprets polyarchy as a system of rights. Specifically, he refers to these rights as being crucial in protecting and guaranteeing political institutions of polyarchy. Specifically, these rights include procedural rights such as (a) political equality, (b) effective participation, and (c) enlightened understanding in political and economic life (Bailey & Braybrooke, 2003).

Some scholars have argued that polyarchy is incapable of promoting democracy in societies deeply divided along cultural or ethnic lines and where “civil war is always a possibility during times of extreme conflict, especially when what is at stake is the right of a subculture to participate in governance” (Bailey & Braybrooke, 2003, p. 112).

Polyarchies not only have difficulty accommodating extreme conflict, but they may actually generate and exacerbate it. By allowing citizens to articulate their grievances freely and join associations to advance their causes, polyarchies place political weapons in the hands of people who may be culturally hostile to their fellow citizens (Bailey & Braybrooke, 2003, p. 112).

Majoritarian, or Westminster, Democracy

Majoritarian democracy is a modern form of democracy, termed the *Westminster model* by political scientist Arend Lijphart (1999) to denote the Palace of Westminster in London, where the parliament of the United Kingdom

convenes. Lijphart refers to the United Kingdom as the best example of this model.

Lijphart (1999) provides 10 distinct features to characterize this modern form of democracy:

1. Concentration of executive power in one party and bare majority: The ruling cabinet consists of a one party majority and excludes minority parties.
2. Cabinet dominance: The cabinet, composed of leaders of a cohesive majority party, can be confident of passing legislation.
3. Two party system: Government is dominated by two large parties.
4. Majoritarian and disproportional system of elections: The election system functions according to single member district plurality, or a first past the post system.
5. Interest group pluralism: Competition and conflict characterize the interest group system.
6. Unitary and centralized government: Local governments are part of the central government, their powers are not constitutionally guaranteed, and they are financially dependent on the central government.
7. Concentration of legislative power in a unicameral legislature.
8. Constitutional flexibility: For example, in the United Kingdom, there is no written constitution, and as such, Parliament can freely change policies or law by regular majorities and not by supermajorities.
9. Absence of judicial review: Since a written constitution does not exist, there is no written document by which courts can decide the constitutionality of legislation.
10. A central bank controlled by the executive: In this model, banks are controlled by the cabinet and are not independent.

Countries with this model of government tend to have homogeneous societies. This form of government can be seen in countries such as Canada, Australia, New Zealand, and most of the British former colonies in Asia, Africa, and the Caribbean after their independence (Lijphart, 1999). Although majoritarian democracy is quite prevalent in the English-speaking world, Lijphart prefers the *consensual model of democracy* in less homogeneous societies (i.e., pluralistic societies), and in fact he believes that the consensual model would be appropriate for most societies.

Consensual Democracy

In contrast to majoritarian democracy, consensual democracy is regarded by Lijphart as a better form of democracy in societies that are culturally heterogeneous (or what he calls “plural societies”). Especially in plural societies, majority rule becomes “not only undemocratic but also dangerous because minorities that are continually denied access to power will feel excluded and discriminated against and may lose their allegiance to the regime” (Lijphart, 1999, p. 32). In most deeply divided societies, such as Northern Ireland, “majority rule spells majority

dictatorship and civil strife rather than democracy” (p. 33). As such, consensual democracy is best for “less divided but still heterogeneous countries” as well as homogeneous societies (p. 33).

Lijphart (1999) provides 10 distinct features to characterize this modern form of democracy:

1. Executive power sharing in broad coalition cabinets: In this model, all or most of the important parties share executive power in broad coalition.
2. Executive legislative balance of power: There is a formal separation of power between the executive and the legislature, allowing for more independence between these two branches of government. Additionally, the legislature cannot stage a vote of no confidence.
3. Multiparty system: In a pluralist society, such as in Switzerland, parties are divided along several lines.
4. Proportional representation: This electoral system divides parliamentary seats among the parties in proportion to the votes they receive.
5. Interest group corporatism.
6. Federal and decentralized government.
7. Strong bicameralism.
8. Constitutional rigidity: A written constitution exists and can be changed only by special legislative majorities.
9. Judicial review.
10. Central bank: Some degree of independence exists for banks in monetary policy making decisions.

Consociational Democracy

Consociational democracy is a specific form of consensual democracy that Lijphart (1976) proposed in his book *The Politics of Accommodation* as a solution for societies that are deeply divided along ethnic, religious, or cultural lines. Specifically, he argued that a solution for deeply divided societies such as the Netherlands is a system of government in which groups share power within institutions. The idea of group representation is key in Lijphart’s view of achieving democracy, and the consociational model of democracy would provide for more group participation and a voice for minorities. Countries such as the Netherlands and Switzerland are the best examples of this type of democracy.

Delegative Democracy

In the 1990s, Guillermo O’Donnell (1994) introduced the idea of *delegative democracy*, which he described as follows:

[Delegative democracies] rest on the premise that whoever wins election to the presidency is thereby entitled to govern as he or she sees fit, constrained only by the hard facts of existing power relations and by a constitutionally limited term of office. The president is to be the embodiment of the nation and the main custodian and definer of its interests. (p. 60)

The policies of this democracy may not reflect the promises made by the candidate's campaign, because the candidate, once elected, is the one who decides what is appropriate for the country.

Delegative democracy occurs in formerly authoritarian states (Argentina, Brazil, Peru, Ecuador, etc.) and post-Communist countries. They meet the basic requirements of being a democratic society but are not as liberal as representative democracies "and do not seem to be on the path toward becoming" representative (O'Donnell, 1994, p. 56). These states are not consolidated or institutionalized, but they do resist regression back to authoritarianism. Delegative democracies are strongly majoritarian and hold fair and clean elections (sometimes using a runoff technique if the first round of elections does not produce a clear-cut majority). In delegative democracies, parties, the congress, and the press are normally free to voice their criticisms, unlike in authoritarian states. In certain situations, courts are able to block "unconstitutional" policies.

Delegative democracy is similar to representative democracy in that representative democracy has an element of delegation: "Through some procedure a collectivity authorizes some individuals to speak for it and eventually to commit the collectivity to what the representative decides" (O'Donnell, 1994, p. 61). However, representation requires accountability. In institutionalized societies, representatives are held accountable for their actions not only vertically, that is, to the electorate, but also horizontally, that is, to other representatives and institutions. According to O'Donnell, vertical accountability, "along with the freedom to form parties and to try to influence public opinion," is present in both delegative and representative democracies; however, the horizontal accountability attributes of representative democracy are "extremely weak or nonexistent in delegative democracies" (p. 61).

Presidents of delegative democracies make conscious efforts to disrupt the development of institutions that provide for horizontal accountability because they believe that such institutions are unnecessary impediments. Weak institutionalization in delegative democracies in turn allows the process of policy making to be swift. This increases the "likelihood of gross mistakes, of hazardous implementation, and of concentrating responsibility for the outcomes on the president," who is praised as a savior at one moment and cursed the next (O'Donnell, 1994, p. 62). In representative democracy, the decision-making process happens at a slow pace and is incremental and sometimes comes to a standstill. But the policies produced are usually less prone to gross mistakes and have a better chance of being implemented, and the responsibility for mistakes is shared among a wide range of institutions.

O'Donnell's model of delegative democracy is criticized for its failure to explain "why some presidents have been more successful than others in promoting economic reform" (Panizza, 2000, p. 738) and for undermining the importance of the politico-institutional settings in which

these reforms took place. Panizza (2000) emphasizes the importance of taking into account "the political context under which presidential power operates, the importance of coalition building and the informal and institutional constraints on that power" (p. 738).

Deliberative Democracy

Deliberative democracy is the idea that legitimate law-making stems from the public deliberation of citizens. Deliberative democracy presents "an ideal of political autonomy based on the practical reasoning of citizens" (Bohman & Rehg, 1997, p. ix). Deliberative democracy is often seen as countering *rational choice* and *liberalism* theories. Much of political action is "made up of [a] broad swath of moral conflicts" that are "not properly resolved by mere interest group bargaining" (Macedo, 1999, p. 5). Certain issues, such as affirmative action, environmental protection, or assisted suicide, cannot be resolved through rational choice argument. Many liberals too are more concerned with the fundamental rights and principles of justice than with the moral aspects of the debate. Gutmann and Thompson (1999) state that moral disagreement is ever present in politics, even under the best conditions.

Deliberative democracy promotes the legitimacy of collective decisions. Creating a feeling of legitimacy and democratic goodwill, together with fair process, creates stability in the long run. Another positive characteristic of deliberative democracy is that it encourages "public-spirited perspectives on public issues" (Macedo, 1999, p. 10). It allows the public to contemplate and think about the common good. According to Macedo's argument, deliberative democracy also promotes mutually respectful decision making, as well as the ability to correct mistakes of the past.

Despite its positive qualities, deliberative democracy has often been criticized for its idealism. Frederick Schauer believes it places too much emphasis on deliberation and "talk-based decision procedures" (Schauer, 1999, p. 18). William Simon believes that deliberative democracy's agenda is too broad and that it places too much emphasis on civility in each issue, undermining the energy of some groups that "define and constitute themselves through the assertion of their claims" (Macedo, 1999, p. 51). Last, it is criticized for presupposing a sense of closeness or solidarity among the participants, which is in fact lacking in many countries.

Democratic Autonomy

The model of democratic autonomy addresses the essential question of what it means to be democratic. Democracy as an idea offers a framework that claims that "there are fair and just ways of negotiating values and value disputes" (Held, 1996, p. 297). It is the only "grand" narrative that can legitimately "frame and delimit the competing narratives of the contemporary age" (p. 298).

Democracy does not offer a solution for all injustices and dangers. However, it does offer a first line of defense for public dialogue about general matters, as well as guiding the process of political development toward institutional paths.

The concept of autonomy implies the human ability to reason “self-consciously, to be self-reflective and to be self-determining” (Held, 1996, p. 300). This notion could not develop in a medieval worldview, because in that society, political obligations and rights were connected with property rights and tradition. As the society evolved, the concept of autonomy began to be more popular. Modern liberal society ties “goals of liberty and equality to individualist political, economic and ethical doctrines” (p. 299). These connections require the state to provide necessary conditions to allow citizens to pursue their own interests. This opinion has been largely shaped by Locke, who believed that the state exists to protect individuals’ rights and liberties and is a burden that individuals endure to secure themselves.

Democratic autonomy, therefore, requires people to enjoy equal rights and obligations “within the specification of the political framework, which generates and limits the opportunities available to them” (Held, 1996, p. 324). People should be free and equal in determining the conditions of their own lives as long as they do not impose on the rights of others. In this system, the principle of autonomy is enshrined in a constitution and bill of rights. Democratic autonomy requires open availability of information to ensure that decisions about public life are informed. It introduces new mechanisms to ensure “enlightened participation, such as voter feedback and citizen juries, increase in accountability in public and private life, and . . . [an] institutional framework receptive to experiments with organizational forms” (p. 325).

In democratic autonomy, citizens would have to accept democratic decisions in a variety of circumstances unless these circumstances violate their rights. Does that mean that democratic autonomy will require participation, making it an obligation? Held (1996) believes that this is not the case, because all citizens have the right to have a life of their own within this framework and are capable of making their own decisions to maximize their interests. The democratic autonomy model can also provide for sustained political legitimacy. The principle of autonomy can be the basis for a system that places emphasis on reducing and transforming inequalities within the society through “a double-sided process of democratization” (Held, 1996, p. 334). Only such a system may enjoy a long period of “sustained legitimation by groups other than those . . . it directly privileges” (p. 334).

Arrow’s Impossibility Theorem

Finally, any discussion of democracy would be incomplete without some reference to the work of Kenneth Arrow, and

in particular his *impossibility theorem*. This theorem states that, given several “well-known assumptions, the social orderings of particular alternatives that are meant to reflect individuals’ preferences must match the preferences of an arbitrary individual,” such as a dictator (Hansen, 2002, p. 218). According to the proof of the theorem, a social-choice rule, such as democracy, is out of the question. Dictatorship, in this case, is the only feasible form of rule.

In his proof, Arrow imagines a community attempting to make decisions about economic policy as a committee or direct democracy. The policy in question may be any other type of policy as long as it arrives at an ordering of the proposals put forward and voted on. To choose the policy, each member has to cast a vote. Each member has a preference in regard to the various proposals put forward. Arrow tries to check “the suitability of the procedure by which, from the ballots cast, the community might arrive at an ordering of the proposals which had been put forward and voted on,” and whether or not such a procedure exists (Black, 1969, p. 228).

This theorem shows that no committee procedure will be able to satisfy certain conditions that, as suggested by Arrow, this “procedure might reasonably be required to meet, and that whichever committee procedure we may choose will, for certain sets of schedules, infringe one or more of the apparently reasonable conditions” specified (Black, 1969, p. 228).

In political science, Arrow’s theorem of general impossibility found many supporters (Geanakoplos, 2005). William Riker states that voting outcomes will be different if different voting schemes for the identical set of voter preferences are tested. No voting scheme will produce a unique outcome from a given set of ordered voter preferences unless the regime is “dictatorial or manipulative” (Behrouzi, 2005, p. 64). In addition, Iain McLean stated that in a multidimensional society, the will of the people does not exist. Regardless of what option the people choose, “there’s another which a majority of the people would rather have” (Behrouzi, 2005, p. 65). These premises hint toward impossibility of direct democracy.

Conclusion

Many models of democracy appear in the contemporary political science literature. Many of these models, such as polyarchy and delegative democracy, tend to be descriptive models of reality, whereas others (such as consociationalism and deliberative democracy) tend to be proscriptive solutions to promote democracy under particular social conditions. Although each of these models assumes some basic features of democracy (such as high levels of participation, competition, and civil and political rights), they illustrate the variety of ways in which democracy can be expressed. Democracy and its conceptualization will remain important issues in 21st-century political science.

PROCESSES OF DEMOCRATIZATION

ERIC M. JEPSEN

University of South Dakota

Over the past two generations, few topics in comparative politics have generated as much research and debate as the twin subjects of *democratization* and *democratic consolidation*. Scholarship in recent decades can be seen as part of what has been a longer-standing comparative politics literature dating back to the early post–World War II period that examined subjects such as “requisites of democracy” (Lipset, 1959, p. 69) and preconditions of democratic governance (Dahl, 1971). However, it was not until what would become known as the *third wave of democratization* started building with the overthrow of the Portuguese military government in 1973 that the debates about democracy became one of the pre-eminent topics in the field. Over the course of the past 35 years, there have been a multitude of spirited debates as scholars have sought to explain what leads to democratization and how, once democratic, governments can stay democratic. What follows is an attempt to synthesize this twin body of work by examining the key arguments that have been made in the most important works within the scholarly literature.

This chapter seeks to examine the different streams of the debates in the democratization and consolidation literatures over the past decades. The first section provides a lengthy discussion of the major theoretical contributions in the study of democratization and democratic consolidation, with special attention given to the larger debates that have gripped the field over the years. The 22 key factors

thought to influence prospects for democracy are grouped into six categories and discussed at some length. The following section details the policy implications that stem from the processes of democratization and examines the broader impact these debates have had on democracy promotion and foreign policies of states, large and small. The next section sketches the likely future avenues of research that will be fruitful as further refinement of arguments about factors influencing a democratic turn (or departure) in states around the world. And the concluding section provides a summary of the bigger issues discussed in this chapter and synthesizes the wide-ranging information by listing the key conclusions that can be drawn from the literature. In addition, after the summary, there is a listing of the major works cited in this article and other scholarship that would be of interest for a more in-depth examination of the topic of democracy and democratic consolidation in the field of comparative politics.

Theory, Application, and Evidence

Theoretical debates about democratization and democratic consolidation have been some of the most contested and plentiful of any of the theoretical debates in comparative politics and political science. Over the course of the post–World War II period, scholars have researched and theorized as to the factors that best explain the turn toward

democracy in nondemocratic regimes and the factors that lead to the continuity of democracy and the point at which a state can be considered “safely democratic” or a consolidated democratic country. This section of the chapter outlines the 22 explanations that are thought to be the most important ones influencing democratization and the movement toward democracy around the world. These factors are those that are thought to have influenced “early” democratizing countries like the United States and France, as well as impacting those cases that could be considered to be part of the grouping of countries that moved toward democratic rule in the latter part of the 20th century.

Samuel Huntington (1991), in his seminal book on democracy and democratization, has called these historical periods in which large numbers of countries around the world democratize the three “waves” of democratization. The first wave is considered to be the “long wave,” which took place from the late 18th century until the aftermath of World War I. Although the states that took the democratic path then were few, it was during this period that what would become key long-standing democratic states in North America, Europe, and other parts of the English-speaking world democratized.¹ The second wave is considered to be the time that began in the aftermath of World War II and continued for the better part of two decades.² The second wave was largely the result of decolonization and the systemic effects resulting from allied occupation of and involvement in certain countries and territories in the aftermath of large-scale war in Asia and Europe in the 1930s and 1940s. According to Huntington’s arguments, the third wave of democracy started in southern Europe in 1974 and continued into the 1990s.³ This period is associated with the ending of authoritarian regimes throughout almost all regions of the world and especially the fall of the Communist regimes in Europe in the latter part of the 1980s and early 1990s.

This chapter breaks the explanatory factors thought to lead to (or promote) democratization into six different categorical groups. Recent decades have seen comparative scholars argue that a multitude of factors have led to countries’ becoming democratic. Likewise, many arguments have attempted to account for the consolidation of democracy in certain cases but not in others. Although there have been bitter disagreements in the subfield as to which variables are the most important, this chapter attempts to steer clear of “taking sides” and instead provides a template of the major debates within the literature. The variables discussed in this chapter are based on discussions and synthesis by Huntington (1991), Linz and Stepan (1996), Sörensen (2008), and Tilly (2007) and represent the past several decades of scholarship.

The first category of factors that are thought to create a positive environment for democracy and democratization is *modernization*. This is the classic explanation for democracy and dominated our understanding in the early decades of the debate. The second category includes those variables that can be grouped into *economic preconditions*.

These are factors that have distinct causal mechanisms related to economics or economic development. The third category contains all explanations that are based on what may be labeled *social preconditions*. This category includes a range of explanatory factors, from social structure to metalevel cultural explanations. The fourth group of factors is factors dependent on *timing, sequencing, and politics*. This category includes arguments that have some distinct and explicit treatment of the temporal element of democratization throughout the world. The fifth category includes *agency and advocacy rooted explanations*. These are factors rooted in the activities of social or civil organizations. The sixth category covers explanations related to *external and foreign effects* and *democratic experiential arguments*. All these explanations consider the impact of nondomestic sources of influences on democracy and democratic consolidation.

Modernization

One of the longest-standing categories of explanations as to why countries democratize has to do with what can be called modernization or modernization theory. While this has been one of the most contested and tested arguments in the literature, even after 50 years it remains an important area of research into the sometimes necessary (but not necessarily sufficient) conditions for democracy and democratic governance in states. First formulated in the 1950s, during a period that much later would come to be thought of as the end of the global second wave of democratization, modernization theory suggested that certain factors were necessary for democracy to take root in states across the world. Basically, Lipset (1959), and later others, argued that certain factors such as *high levels of wealth, higher degrees of urbanization, better educated populations, and increased industrialization* would lead to pressures for democracy and democratization. All these factors that were typically associated with what was labeled *modernization* were thought to be the crucial underpinnings of the movement toward democracy in much of the world. As the state became more capable, thanks to economic development and the rationalization of state–society interactions due to modernization, democracy would become more viable and increasingly effective. These supporting pressures were thought to allow for “democratic awakenings” (and later consolidation) in states around the world.

However, Lipset and the early modernization theorists were not without their critics. Scholars in later years would argue that modernization theory was reliant on a handful of cases in North America and Europe and that the processes Lipset and others described did not necessarily always play a supportive role. Scholars would come to criticize many of the suppositions and causal linkages of modernization theory. Some would reverse the causation and say that in certain contexts, authoritarian regimes could be supported or empowered by the very factors thought to sustain democracy under the modernization model. For example,

Rueschemeyer, Stephens, and Stephens (1992) would make the case that this growing state strength could allow authoritarian regimes to push back against democratic forces within a country. O'Donnell (1973) reversed the directional arrows altogether and made the case that the modernizers had it all wrong and that under certain conditions, a strengthened state and antidemocratic elites could forge an alliance to overturn democracy precisely because of modernization. He argued that the nature of lopsided economic development and empowerment of certain business and administrative factions in Latin American countries meant that an increase in incomes and gross domestic product could actually undermine democracy. Later, other scholars would argue that modernization arguments that democratic advocates would be activated in the middle classes as the result of improving social and economic conditions were faulty as well. Critics have also claimed that under certain cases of modernization, there could be an increase in societal tensions along group lines (Diamond, 1989) or an increase in antidemocratic tendencies among elites in modernizing societies (Moore, 1966).

Economic Preconditions

Closely related to modernization theory, economic factors have been thought to impact the likelihood of democratization in three particular ways. It is helpful to look more closely at each of them in isolation and examine the ways that previous comparative political theorizing has posited that economic factors are important in the movement toward democracy and democratic consolidation. The first economic variable that scholars have thought significant in democratization is *wealth*. This is typically considered to be measured by gross domestic product per capita so as to account for differential population size across nations. Lipset (1959) was among the first scholars to explain the manifest prevalence of wealthier countries among democratic countries. In later years, the thesis that wealth leads to democracy would undergo some amount of revision as scholars began to test the linkages put forward by Lipset and the modernization theorists.

As Przeworski and Limongi (1997) and Przeworski, Alvarez, Cheibub, and Limongi (2000) have detailed, we must break down our discussion of wealth and its impact into different temporal relationships with the likelihood of democracy. For example, they argue that we should think of the relationship as being either *endogenous* or *exogenous* when we think of the mechanisms by which wealth is related to prospects for democracy. Their argument is that there is little support for the theory that higher amounts of endogenous wealth lead to greater likelihood of transition. Yet there does seem to be support for an exogenous relationship—that once democratic, countries that are wealthier tend to stay democratic to a greater degree than do those countries that are less wealthy. Although the distinction might seem minor, it gets at the heart of the debate about which processes and factors lead to democratization

and to democratic consolidation. Many scholars argue that the effects are seemingly minor on the democratization side but paramount on the consolidation side. Later scholars have questioned whether these findings hold up for different regions and in different times. In certain regions in certain times, there is more likely to be a transition from authoritarian rule to democratic rule in any given year and in any given case as a country becomes wealthier.

Another notable exception to the wealth-causes-democracy line of inquiry in the literature is the antidemocratic tendencies seen to result from “bad” types of wealth. Specifically, an area of research suggests that countries with strong dependence on a resource that generates great wealth, such as oil, have greater difficulties transitioning to democracy and sustaining democracy over the longer term. Scholars in recent decades have used this argument to make the case that the problems with democracy over the years in countries as divergent as Saudi Arabia, Venezuela, Russia, Mexico, and Nigeria are the result of oil wealth’s “cursing” democratic governance. In a related area of research, there is a long-standing finding in the economic literature that natural resource abundance can, under certain conditions, lead to depressed development and uncompetitive industry because of economic distortions caused by the very reliance on a resource that is generating a large amount of foreign currency and goods. The basic argument in terms of democracy is that the “easy wealth” captured by the state from the export of the natural resource (oftentimes thought to be most pernicious in the case of oil) leads to antidemocratic tendencies in the state because of increased reliance on corporatist and clientistic governing mechanisms. Although there are cases where this problem is thought to be minimal (Norway), many scholars make a clear distinction between “good wealth” and “bad wealth.”

The second economic precondition thought to condition the likelihood of democratization and prospects for democratic consolidation is the effects of *capitalism and free market economies*. Scholars such as Almond (1991), Dahl (1989), and others have argued that key supporting features of democracy built into the practice of capitalism and the functioning of free and open markets serve to reinforce democracy and democratic practices. Almond, in his seminal piece on capitalism and democracy, reviewed the various arguments that have sought to link the practice of capitalism with support for democracy.⁴ As well, Dahl has argued that the linkage is clear and that definite patterns of support result from economic development that comes about in capitalist systems. In addition, capitalism also allows for the creation of other independent factors thought to support the turn toward democracy. Specifically, it is thought to result in many instances in an expansion of the middle class and empowerment of social and economic interests via capitalist development. These are then thought to aid in democratization and democratic consolidation.

The third economic precondition thought to positively influence chances for democratization and democratic consolidation is the *equitable distribution of, and access*

to, land and resources. The roots of this argument are based on the expectation that more equitable and egalitarian societies provide the support necessary for democracy to take hold. As Moore (1966) and Dahl (1989) have suggested, societies with less polarized resource distribution and less concentrated landholding patterns are thought to reinforce elite and interest group participation in stabilized “rules of the game” that democracy provides. In more polarized, less egalitarian land and resource situations, it is thought that a winner-take-all circumstance could lead to destabilizing and antidemocratic tendencies. Although both Moore and Dahl acknowledge that equitable distribution of land and resources is not a sufficient cause of democracy and democratic stability, it is thought that already polarized group-based societies could dangerously reinforce conflict that could harm progress toward democratization. Scholars in recent years have pointed to the lack of this condition in many cases around the world as one of the key reasons for the few “new” cases of democracy in the past decade or so.

Social Preconditions

The next category of causal mechanisms that have been thought to be supportive of democratization and democratic consolidation contains those that can be labeled social preconditions. The first of these is thought to be that the *absence of a history of feudalism* (as well as non-European feudalistic traditions) is better for the flourishing of democracy. Moore (1966) counts the longer-term effects of feudal social structures as one of the more important factors lessening the prospects for democracy in certain cases, with the basic tenets of the argument suggesting that a rigid social system casts a shadow and has debilitating effects in the longer term. While this condition is associated with some of the others discussed in this chapter (especially land use patterns and the degree of pluralism within society), it is distinct in that scholars have explored the narrower effects of previous feudal relationships on later relative strength of antidemocratic forces in certain cases.

The second social precondition is what can be labeled a “strong bourgeoisie,” in the words of Moore (1966), or a *strong middle class*. Although functionally different in classical definition, a strong middle class and a strong bourgeoisie have come to be discussed in unison in recent years. These concepts are also related to other social conditions discussed in this section. Moore’s comparative history of democratization in several important cases led him to argue that one of the most crucial inputs for successful democratization (and longer-term democratic sustainability) was the existence of a linchpin supporter of democracy in the form of a bourgeoisie class. The bourgeoisie serves as the stabilizing influence over and in favor of regularized and transparent political processes that can be best handled by democratic forms of government. After democratization, the bourgeoisie serves as the primary sustainer of consolidation in the face of antidemocratic tendencies

among elites and lower classes, both rural and urban. Similarly, as argued by Putnam (1993) in his analysis of relative democracy across the regions of Italy, the middle classes can serve as a buffer between the extremes of the political landscape and lead to a necessary underpinning of democracy and democratic governance.

The third social precondition that is argued to be important to democratization and democratic consolidation is *Protestantism*. The root of this argument can be found in the much earlier arguments of the early-20th-century German sociologist Max Weber and his arguments about the supportive framework that Protestantism provides for capitalism. In later scholarship, researchers such as Wiarda (1982) argued that Latin America’s difficult experience with democracy and democratic stability during the post–World War II period was the result of the detrimental effects of Catholicism on the social structure in the region. Many of the arguments that have been made about Protestantism serving as a source of support for democracy are nested in reasoning that traces how it leads to higher levels of accountability and citizen participation in political life, which enables democracy to take hold in different cases. Nevertheless, these arguments are much contested by many scholars, and the longer-term viability of some of the findings has been limited.

The fourth social precondition that scholars have cited as being instrumental in supporting democratization and democratic consolidation is the basket of arguments that concern *political culture, civic culture, and values*. This line of inquiry argues that there are certain societies that have, at the macrocultural level, attributes and tendencies that support the democratic project. Almond and Verba (1963) and Inglehart (1990) make arguments that this is a key explanatory variable that determines the relative likelihood of successful democratization and consolidation. Scholars that have made these types of cultural arguments contend that these core, slow-moving, society-wide values greatly impact a country’s experience with democratic governance. In the end, it is thought by proponents of this line of thinking that unsupportive values and political cultures will lead to repeated democratic setbacks and reversals, with prospects for long-term democracy possible only after a change in those values and the macroculture.

The fifth and final social precondition variable thought to impact prospects for democracy is that *cultural homogeneity* is a positive force for democracy and democratic consolidation. This argument suggests that in situations in which there are significant societal cleavages or ingroup–outgroup patterns of polarization, democracy is difficult to promote and sustain. Scholars point to the early outposts of (relatively) homogeneous countries in North America and Europe as transitioning to democracy more quickly, and trace out the causes of democratic reversals in Asia and Latin America as being the result of group conflict and heterogeneous societies. There have been glaring exceptions to this precondition, with highly

diverse countries such as India having successful democratic track records in the latter half of the 20th century.

Timing, Sequencing, and Politics

An additional category of explanations for successful democratization and democratic consolidations focuses on distinctly political patterns, sequencing, and timing. The first argument is that the *development of contested politics before the expansion of suffrage and participation* leads to a greater chance of a successful democratic experience. The logic here is that newly democratizing countries cannot handle the system shock of having the political system open up all at once and that a lasting commitment to democratic practices can result only after years or decades of successful political competition among a narrow band of a polity. Scholars point to the United States and Great Britain and their respective many-decades-long opening up of political participation by group and gender well after regularized political competition among a smaller band of society (in each case by landed, white males at the start). Although this argument is difficult to advocate in terms of a policy prescription, researchers have pointed to it as a source of democratic breakdown in Latin American and Asian cases in particular.

A second trait in this category is the importance of *low levels of civil violence, polarization, and extremism* in the likelihood of democracy and consolidation. The logic here is fairly straightforward: In conditions of instability and violence, actors at the elite and mass levels are less likely to commit to regularized and open democratic governance when there are immediate threats to their lives and livelihoods. Because democracy and democratic consolidation require commitments to future payoffs despite possible near-term loss of political power, violence and extreme polarization can stop a turn toward democracy in its infant stages. Until there is a brokered and longer-term cessation of these types of problems, scholars have argued, democracy is unlikely to be successful.

A third trait in this category is the *fairly uncomplicated experience* argument. Theorizing and empirical research have consistently demonstrated that democratization is rarely successful on the first go-round (Przeworski et al., 2000). Countries that have had prior experience with democracy are more likely to revert to it sometime in the future than are countries with no sort of democratic tradition or “practice.” Two sets of logic in the literature support this trait. One, if a country has had some form of democratic experience, democracy will be perceived by groups within that society as a possible “real” option in the future. And two, previous iterations of democracy have likely left behind building blocks of future democracy: political parties and civic groups that likely have a permanent openness toward democratic governance.

A fourth trait in this category is Tilly’s (2007) recent conception of *trust networks and categorical equality*.

Specifically, he has argued that the subjugation of the state to public politics, along with expanding popular control over that political game, results in regularized control over governance. This regularized control over governance leads to the formation of trust networks as people become willing to abide by the set rules of the democratic game. And, in a supporting role from the other direction, the state monitors antidemocratic tendencies and groups and seeks to eliminate these threats before they undermine the democratic project.

Agency and Advocacy

The next category of explanations relates to specific actions and work by elements (individuals and groups) within society. It is thought that agency and specific activities can play a supporting role in democratization and democratic consolidation. The first of these agency-based explanations is what has come to be known as the “*elite pacts*” argument. First formulated by O’Donnell and Schmitter (1986), this argument holds that in order for transitions to democracy to be successful and long lasting, top-society groups must forge agreements about democracy’s ability to regularize political competition among competing elite groups. These privileged groups, therefore, would agree not to “kick over the table” (i.e., support nondemocratic and authoritarian governments). The argument here is that “pacted democratization” is necessary, especially in societies and cases in which elite groups have had extreme and polarized patterns of political interactions. O’Donnell and Schmitter pointed to many Latin American and southern European cases as having democratized successfully, primarily because of top-level agreements among politically powerful groups.

The second agency-based explanation for successful democracy and democratic consolidation revolves around arguments that *active civil societies* create the necessary conditions for the turn toward democracy and, later, its consolidation. This line of inquiry and theorizing is rooted in the type of analysis provided by Alexis de Tocqueville, the 19th-century French writer and political observer who identified the richness and diversity of civic life in the United States as the critical underpinning of its democratic life. The thrust of the argument is that an activated and engaged mass public will deliver sustained democratization pressures via the measures resulting from regularized, collective interaction.

The third explanation in this category is related to the richness of civil society argument noted above. However, this explanation is rooted in the impact of the *character of the social groups* themselves. The argument is that all social and civic groups are not created equal. Some have greater impact on prospects for democracy and democratic consolidation. Mass democracy becomes more likely when microlevel democracy is present in groups that have a direct or instrumental role in political life. Political parties and policy-oriented social groups that

operate in a democratic manner are likely to lead to “spillover democracy” in general political life.

External Actors

The final set of explanations for democratization’s birth and growth all revolve around the role and legacy of external actors. First, it has been argued that *intervention by a foreign party*, under certain conditions, can lead to democratization. Likewise, according to some scholars, support and prodemocratic pressure from abroad can lead to increased likelihood of democracy’s taking hold. The successful and rapid democratization of Japan and West Germany following World War II is pointed to as a successful example of foreign influence on newly democratizing countries. Although the involvement of a foreign power in a country’s political affairs is oftentimes antidemocratic, there is some evidence that clearly prodemocratic influence from an outside force can lead to increased chances for democratic survival.

A second type of external argument is called the *diffusion effect*. Specifically, this argument suggests that the diffusion of democracy by geographical or temporal clusters has its own stand-alone effect separate from the component parts or similarities of cases. In other words, a distinct “wave effect” accounts for part of the democratization that occurs in similar time periods and in certain regions of the world. Whether this effect is due to creation of possible options in the minds of key actors within countries or reflects a metalevel supporting environment, many scholars have suggested that diffusion helps explain why and when democratization occurs and consolidates.

A third type of external argument is that something about the *colonial experiences* of certain states conditions pathways to democratic governance. In particular, scholars have argued that the British colonial experience is distinct from other colonial experiences (namely, Spanish, Portuguese, French, etc.) and that former British colonies are more likely to be democracies than are other former colonies. The key argument here is that the specific components of the British colonial experience—especially professionalized bureaucracies, elements of the Westminster parliamentary system, and elite education systems—cast a long shadow that increases the likelihood of successful democratization and democratic consolidation.

Policy Implications

A host of policy implications result from the wider theoretical literature on democratization and democratic consolidation. Lessons from the research could be applied by individual countries, foreign powers, and nongovernmental organizations. Although the democratization literature contains some contradictory arguments, by and large it identifies a baseline level of standard supporting components for increasing the numbers of democracies in the

world. Trends in many of these areas can be found in the yearly *Freedom in the World Report* by Freedom House (www.freedomhouse.org). This section discusses briefly the key variables that should be improved in order to increase the number of democracies in the world and to stabilize and consolidate those already in existence.

On the economic front, it is generally thought that economic development and the alleviation of poverty will lead to increased prospects for democracy. Incorporation of some elements of the market economy and modernization will also lead to a supportive environment. In some cases, there should be a certain amount of land reform or redistribution if the society has skewed distributions of wealth, and natural resources should be held in a way that benefits the vast majority of the population. None of these policy suggestions are sufficient for democracy and the consolidation of democracy, but the theoretical literature generally agrees that these types of reforms and policies would be supportive.

On the social and political fronts, it is thought that all efforts should be made toward alleviating the tensions associated with civil strife that is the result of group difference. Institutional reforms should be adopted that would allow for less friction in a country’s political life. As well, it is believed that civic groups and nongovernmental organizations should be empowered so as to provide a further building block of regularized and peaceful political organization and interaction.

Future Directions

Research in comparative politics and international relations on democratization and democratic consolidation has a long and rich history of theoretically informed scholarship. In addition, the subfield faces challenges and associated research questions. First, future research needs to do a better job of explaining the conditions under which these 22 factors positively reinforce democracy and democratic consolidation. Does their effect vary to a large degree by region and time? Research must also address the way these processes relate to each other and what the policy implications are for governments. Second, future research needs to explain democratic reversals and backsliding. The slowing of democratization around the world in the past decade has also corresponded to instances of democratic death and decline in certain cases. What can existing theory say about the reasons for these problems and what are the warning signs of a “failure to consolidate”?

As we move toward the 40th anniversary of the start of the third wave, we seem to have a limited understanding of what constitutes full consolidation, instead of what might merely be “not failed as of yet.” Tilly (2007) has attempted to sketch out an agenda for what research into “de-democratization” might look like, but there is a long way to go before we have a comprehensive framework by which we can explain what leads to the formative stages of problems

in democracy. And finally, it seems that with the “stabilizing” (or lack of democratic gains) of the number of democratic states around the world in recent years, we do not have a solid understanding of the most important factors in determining where democracy’s next footholds will likely be and when they might take place. Although comparative politics and students of democratization hesitate to engage in predictive and proscriptive analysis, because of the real security issues now faced around the world, a proper engagement of this line of inquiry must occur as theory building continues.

Conclusion

This chapter has surveyed the divergent strands of 50 years of comparative politics scholarship on the topic of democratization and democratic consolidation and concentrated on the most influential and most debated factors over recent decades. These factors coalesce into six categories: modernization; economic preconditions; social preconditions; timing, sequencing, and politics; agency and advocacy; and external actors and experience. Identifying these categories highlights the causal mechanisms that scholars think have increased the numbers of democratic states around the world. In addition, many of these factors promote the consolidation of democracy once it has been established in a particular case. Although many of the factors have had their respective advocates and detractors over the years, nearly all of them continue to be thought important, both in the academic world and in the real world of governance.

We can also see the broad outlines of what areas of research and theorizing still need attention after the past half century of debate. Lipset published “Some Social Requisites of Democracy” in 1959, and since that time, comparative politics research has made great strides in explaining the relationship between various factors and democratic governance around the world. Because of geopolitical realities and the continued debates surrounding democracy promotion and economic development around the world, it is likely that an examination of the processes of democratization and democratic consolidation will continue to be a key topic in comparative politics. Large numbers of scholars continue to ask important questions, and the nature of politics in many states around the world suggests that the real-world implications will continue to drive the debates forward. In all likelihood, the next half century will see further important contributions to this line of inquiry, and there will surely be additional sophistication in the models seeking to identify the causal mechanisms of democratization and democratic consolidation.

Notes

1. Countries that Huntington lists as democratizing during the first wave are Australia, Canada, Finland, Iceland, Ireland,

New Zealand, Sweden, Switzerland, the United Kingdom, the United States, and Chile. Some other countries democratized during the first wave but later reverted to nondemocratic rule (notably Austria, Belgium, Colombia, Denmark, France, Germany, Italy, Japan, the Netherlands, and Norway).

2. Countries in the second wave of democratization are Botswana, Costa Rica, Gambia, Israel, Jamaica, Malaysia, Malta, Sri Lanka, Trinidad and Tobago, and Venezuela. As with the first wave, several countries democratized during this period but later reverted to nondemocratic rule (notably Bolivia, Brazil, Ecuador, India, South Korea, Pakistan, Peru, the Philippines, and Turkey).

3. He argues that the third wave started with the fall of military regimes in Portugal and Greece and later spread to many parts of the world (notably Bulgaria, the Dominican Republic, El Salvador, Guatemala, Honduras, Mongolia, Namibia, Nicaragua, Panama, New Guinea, Romania, Poland, and Senegal).

4. To be fair, however, Almond (1991) goes on to explore the literature that suggests that capitalism can be detrimental to the development of democracy. He also explores the arguments associated with the causal arrows pointing in the opposite direction: democracy supporting capitalism and democracy undermining capitalism.

COMPARATIVE METHODS

MICHELLE C. FLORES

University of Southern California

As a subdiscipline of political science, comparative politics aims to explain and understand the dynamics of political power as practiced throughout the world. In pursuit of this goal, comparativists have developed a range of methods to compare the large number of vastly different political systems they study. While philosophers, historians, and theologians have long crafted political theory in a systematic fashion, the establishment of modern political science departments and the rapid increase in their number during the 20th century inspired a fruitful debate about the appropriate means to carry out comparative political research. In the early 21st century, there is growing recognition of the necessity of multiple methods, and recent methodological debates have centered on the best ways to enhance dialogue between scholars from different methodological backgrounds who nevertheless share substantive concerns.

This chapter provides an overview of comparative methods as understood by their practitioners. It presents a number of alternative approaches, discusses their implications, and shows how these approaches have been used in exemplary works in the field. The chapter ends with a discussion of current trends in comparative methodology and how they might impact the future of the discipline.

Comparative Methods: Qualitative, Quantitative, and Formal Methodologies in Comparative Research

Taking the natural sciences as its model, political science has sought to create theories to explain and predict various aspects of political life. Indeed, political scientists have striven to shape their craft scientifically by putting in place and advocating systematic research processes aimed at cumulating knowledge. In this sense, the choice of method is but one step in a larger research process that usually includes a clear delineation of the research question, an examination of the existent theory related to the problem, a description of the data to be used, a method of data analysis, and discussion of the potential contribution to theory. The sum of these parts is referred to as the research design, and comparativists generally agree that it should be both logically consistent and justified by the problem it studies. Therefore, in assessing the range of comparative methods, it is important to look at how comparative methods fit with various aspects of research design.

The most influential early work on research design was Adam Przeworski and Henry Teune's (1970) *Logic of Comparative Social Inquiry*. Their work aimed at designing research that would develop general social theory by confirming, through comparative research, hypothetical

statements that replaced proper names of social systems with names of variables. They posited a basic distinction between what they called *most similar* and *most different systems* research designs. In most similar systems research designs, cases are chosen on the basis of assumed similarities at the systemic level (state, culture, nation, etc.), whereas in most different systems designs, the type of cases and the level of analysis emerge from the analysis of theoretically relevant factors in data that assume the homogeneity of all units. Although Przeworski and Teune did not deny that there was some value in most similar systems designs, their delineation of comparative research was particularly rigid insofar as it asserted that the most different systems design, the definition of whose units was based on a random multistep sample of all social systems, was the *only* research design that could allow universal generalizations. Nevertheless, their argument was enormously influential and sparked an invaluable debate within the field about the goals of research and the importance of research design.

Przeworski and Teune's argument went well beyond the matter of choosing cases, however, and sought to emphasize the scientific quality of the comparative method. Arend Lijphart (1971) furthered this logic, depicting the comparative method as a way of achieving scientific explanation, albeit one with certain limitations. Chief among the difficulties facing comparativists, Lijphart contended, was constructing parsimonious theories based on research that inherently involved many variables but few cases, especially cross-national research. This difficulty was not seen as debilitating, however, and many of the ways that Lijphart suggested to mitigate the problem—including conceptual and statistical techniques for reducing the number of variables and increasing the number of cases—continue to be used today (see section titled "Scope" below).

More recent methodological debates, however, center less on justifying a scientific approach to political phenomena than on arguing a best fit between research question and the types of data that will be gathered, how they will be analyzed, and the relationship between data analysis and theory. Although the mainstream methodology literature in comparative politics continues to advocate a quantitative, statistical approach to studying comparative politics, there is growing recognition that the methodological landscape has become far more complex. It can be roughly divided into two categories: *empirical* and *formal* methods. Empirical methodologies are largely divided between *quantitative* and *qualitative* traditions, and the formal methods used in comparative politics are dominated by *game theoretic models of rational choice theory* (Laitin, 2002).

Research as a Mediated Encounter Between Theory and Fact

Whether perceived as a constant dialogue or as one controlled instance, comparative political research can be

usefully described as the researcher's fruitful encounter with theory and fact. Comparative methods mediate this encounter, providing researchers with systematic ways to produce knowledge based on what was previously understood about an issue and what can be observed in the world. They help the researcher explain connections, concepts, and causes that are not observable without systematic analysis. Thus, comparative methods are at the center of the systematic processes political scientists use to facilitate the creation and transmission of knowledge.

The choice of method impacts or is impacted by the decisions scholars make at every point in the research process, from choosing the research question to presenting their conclusions. Of course, there is a great deal of variation within methodological traditions, as well as some overlap in their application and potentialities. In fact, the differences presented here are not rigid, and much of the methodological innovation in the field rests on the ability of researchers to create internally consistent research designs that cannot be neatly categorized on either side of traditional methodological divisions. Nevertheless, for the purpose of this chapter, it is useful to sketch these ideal types based on their use in the discipline. What follows is a consideration of the role of comparative methods as a mediator in three aspects of research: theory generation and the goals of research, methods of analysis, and theory assessment.

Methods of Theory Generation and Goals of Research

Theory generation in political science can be carried out either inductively or deductively. According to Gerardo Munck and Richard Snyder (2007), the overwhelming majority of research in comparative politics is inductive. The inductive approach to theory is one in which theory flows from the analysis of observed facts. In other words, theoretical generalizations are built on the basis of specific facts, usually the data analyzed by the researcher. Although both qualitative and quantitative researchers engage in inductive analysis, game theoretic formal modelers of rational choice theory typically do not. Whichever method is used, inductive research typically contributes to generating new theories by specifying concepts and variables or by introducing new hypotheses to be tested. Inductive research is also particularly useful for studying areas of knowledge about which little is known and topics that lack a well-developed conceptual vocabulary. Comparative relationships between religion and the state are one such area of research. Jonathan Fox and Todd Sandler (2003) approach this issue area from the quantitative tradition in their article "Quantifying Religion," which develops a series of variables for measuring religion in comparative studies. In this case, the notion of *variable* is roughly equivalent to the *concept* that would result from similarly inductive qualitative work. Such concepts and variables provide essential components for deductive theorizing.

Deductive research begins with a theoretically derived hypothesis (King, Keohane, & Verba, 1994). As with the inductive approach, deductive theorizing is used by quantitative and qualitative researchers alike; it also forms the sturdy basis on which rational choice game theorists model action. A deductive approach to theory builds on a discipline's collective knowledge about a subject by encouraging researchers to form specific, testable hypotheses deduced from theoretical maxims and to submit those hypotheses to empirical tests. As such, the principal benefit of deductive research is its claim to produce cumulative knowledge. Another important benefit is the simple and powerful process that deductive theory generation prescribes for the conduct of research. Deductive reasoning requires researchers to deduce specific, observable implications of broad-gauged theories. In that way, it allows comparativists to address the most enduring questions in the field by using relatively little data (Geddes, 2003, offers a step-by-step procedure for formulating such questions). A potential weakness of the deductive approach is that it assumes that researchers have already amassed a great deal of coherent theoretical knowledge on a given topic. Indeed, whereas inductive reasoning, in its search for ever greater detail, risks infinitely delaying theory development, so deductive reasoning assumes that much of the theorizing has already been done.

Goals of Research

Although comparativists are united around their aim to explain and understand political phenomena around the world, their choice of method constrains them in the types of arguments they can make. *Designing Social Inquiry*, by Gary King, Robert Keohane, and Sidney Verba (1994), the most influential statement of the quantitative approach in the field, sums up the goal of research in a single word: *inference*. Inference allows researchers to extend their findings to other situations not directly observed by the initial study. In order to improve theory, King et al. outline a systematic, scientific procedure for testing theory aimed at producing valid descriptive and, preferably, causal inferences. A related goal of the quantitative approach is to maximize the researchers' leverage in explaining the phenomena of interest by allowing researchers to use the least amount of data to make the broadest generalization possible. While the authors of *Designing Social Inquiry* contend that their approach is suitable for both quantitative and qualitative work, most scholars within the qualitative tradition take a different view.

Because qualitative research has the largest, most varied literature, as well as a plethora of distinct methodological tools, its theoretical goals are somewhat more diffuse. However, it is often said that whereas quantitative researchers are primarily concerned with explaining, qualitative researchers seek to understand. Although many qualitative methods seek causal explanations, practitioners in this tradition are more likely to be concerned with

understanding *how* a phenomenon came about than with explaining why it did. In other words, they tend to be more concerned with process than with probability or prediction. Charles Ragin, who has developed some of the most enduring qualitative tools (see, e.g., Ragin, 1987, 2000), describes the interpretive goals of qualitative research as "making sense of cases, selected because they are substantively or theoretically important" (Ragin, 2004, p. 109). Indeed, the pursuit of historical nuance and detailed narrative explain the tendency of qualitative researchers to focus on a small number of cases.

Whereas quantitative researchers seek to explain and qualitative researchers to understand, game theoretic modelers of rational choice theory aim their analysis at simplifying complex processes in order to predict. Rational choice-driven game theory is an individual-level theory that assumes that individuals attempt to maximize their utility, that decisions are made at points of equilibrium when "players" cannot increase their utility by making an additional move, and that the rules of the game are exogenous to the game itself (see Munck, 2001). Because these three conditions are assumed to be universal aspects of individual behavior, game theory purports to be applicable to *any* substantive question and able, therefore, to produce cumulative knowledge (for an important critique of the use of game theory in political science, see Green & Shapiro, 1994). While game theory is not the only framework used to carry out formal work in political science, it is by far the most common. Another formal approach is *network analysis*, which, although not as common in comparative politics, has already contributed to some substantive areas in the field and is poised to become an increasingly important method in the coming years (see Gould, 2003).

Methods of Analysis

Comparative methods mediate the scholarly encounter with observable facts by providing researchers with tools for analyzing data. Quantitative, qualitative, and formal methodological tools are differentiated by how they limit the scope of their research, how they measure the relevant variables or case aspects, and how they assess the theories they engage with.

Scope

Scope refers to the plausible applicability of a theory to a defined group of political situations or cases. In other words, the scope of a project informs its readers as to *what* precisely the research claims to create knowledge about and the relevance of its findings to other contexts and cases. Although many comparativists are concerned with the same "big questions," they disagree about which types of evidence should be employed to theorize about such questions. Thus, scope is the aspect of theory most closely related to data collection and analysis and depends in large part on the choices that a researcher makes in this regard.

The scope of a quantitative research project involves specifying the statistical model to be used, including the independent and dependent variables, and the number and quality of cases to be studied. It should be mentioned here that statistical models, which some consider formal (see King, 1989), are distinguished from game theoretic formal models of rational choice theory by the fact that variables in statistical models are typically closer representations of observable phenomena (see also Morton, 1991, p. 61). In terms of case selection, research norms in the quantitative tradition encourage the consideration of the entire universe of cases relevant to the phenomenon under study. What should be considered a case depends on the hypothesis and the unit for which it predicts outcomes. Thus, *case* may refer to a variety of units of analysis (i.e., state, party, city) or an event (i.e., civil war, policy selection, regime change). When it is not possible for a researcher to study the entire universe of cases, a sample from the universe should be taken in accordance with some substantive aspect of the theory (i.e., a given period), preferably at random, and in no case by selecting on the value of the dependent variable.

Certainly, choosing cases that have all experienced a similar dependent outcome in order to explain that very outcome leads to theoretical distortion in quantitative tests of theory. Yet resisting the temptation is not always intuitive. In fact, if one wants to explain why some states experience rapid economic growth in the wake of revolutions, it might seem logical to focus first on those cases in which such growth is known to have occurred, and only then attempt to explain what differentiates these cases from others. This would be a logical sequence for a qualitative researcher interested in developing in-depth knowledge of anomalous political processes or counterintuitive cases. However, if the researcher is more concerned with testing for the impact of theoretically relevant factors on the dependent variable, a strategy that begins with the universe of all cases would be a better fit. In fact, what distinguishes these research strategies from each other is not the absolute quality of the research involved but rather the scope of the arguments made possible by different types of research design (see Geddes, 2003, Chapter 3, for a more thorough analysis of this problem and its implications for comparative work).

Another important problem confronting quantitative researchers is the problem of *indeterminacy*. Indeterminacy usually springs from two sources related to specification of the model. The first is referred to as the *many variables, small N problem* identified by Lijphart (1971) and others. This problem arises when the number of inferences implied by a statistical model exceeds the number of cases. In such research designs, the number of cases could not possibly test for the causes suggested by the theory. The second most common reason for indeterminacy is *multicollinearity*. This problem arises when the explanatory variables of a statistical model are not independent of each other. For example, a study that seeks to explain the level of political

participation by women in new democracies might include variables measuring women's levels of education and women's workforce participation. To the extent that variation in the value of one of these variables predicts variation in the other, it would not be possible to measure the independent impact of either of them on the level of women's political participation in a given country. Statistically, problems of multicollinearity can be partially offset by increasing the number of observations. Such a strategy, however, runs the risks of either comparing cases that are not analytically equivalent or, if undertaken in an ad hoc fashion, altering the model without reference to theory. Despite these limitations, quantitative comparison has proven to be a useful and efficient method for testing hypotheses on large amounts of data that would be difficult to consider otherwise.

Scope is the most readily apparent difference between quantitative and qualitative work in comparative politics. While statistical work requires a relatively large number of cases, or observations, qualitative work tends to focus on a small number of cases. Part of this difference is semantic and attributable to the fact that the research questions of comparativists are often formulated at the level of the state. Even when the state is not the relevant focus of research, there is a substantial difference between the quantitative conception of a case as an analytically homogeneous unit among others and the qualitative view of a case as a "class of events" (George & Bennett, 2005, p. 17).

The scope of a qualitative research design ultimately depends on the goals of the researcher. If researchers aim to revise an existing theory or extend it, they will likely look to the literature for an anomalous case that has some potential to engage with the theoretical lacunae they seek to address. On the other hand, if researchers are interested in assessing the credibility of a theory, they might select a number of cases known to have experienced a similar outcome but whose histories they suspect involved different causal processes. This manner of case selection is starkly different from a statistical approach that warns against the analytical pitfalls of choosing cases on the value of the dependent variable. In cases of political phenomena about which there is relatively little theoretical knowledge, a qualitative research design may not be able to specify initially the cases under study. Such research designs, usually aimed at conceptual development or the construction of explanatory typologies, typically consist of a constant dialogue between theory and data aimed at understanding how to delimit the case itself and explaining what it is a case of.

The scope of a formal model rests on its assumptions and on how the model is constructed. As stated above, game theoretic models of rational choice theory assume that individuals seek to maximize their utility, that decisions are made at equilibria based on actors' preferences, and that the rules of the game are exogenous to the game itself. Because these assumptions are generally seen as universal, formal modelers of rational choice theory must use

some other criteria to explain their choice of scope. Indeed, rational choice theory does not itself stipulate any specific procedure for constructing formal models, and researchers in this tradition have not emphasized case selection as an important point of methodological reflection. Thus, during the late 1980s and 1990s, when game theory began to be used with greater frequency in studying comparative politics, the universality of rational choice assumptions became a subject of intense debate. In response, some researchers sought to limit the scope of rational choice theory either by relaxing its assumptions or by limiting its application to those cases in which its assumptions are most likely to reflect actual behavior. George Tsebelis (1990), for example, set forth the idea that rationality was a subset of human behavior more likely to describe situations in which the “actors’ identity and goals are established and the rules of the interaction are precise and known to the interacting agent” (p. 32). Yet others argued that much as regression analysis has, by necessity, an error term that provides researchers greater control in estimating causality, so formal models of rational choice theory are built on some false assumptions that facilitate hypothesis generation. Indeed, it is the simplicity of rational choice assumptions that allows the models to make clear and precise prediction. The more these assumptions are relaxed, the more difficult the model becomes to solve, and the less clear its predictions. In sum, the arguments that result from formal studies are relevant only to cases that fit the assumptions on which the model is based. Empirical work, on the other hand, is far more reliant on the precision of its definitions in specifying those cases to which its arguments can and cannot apply.

Measurement

Another area in which methods mediate the encounter between the researcher and the data is in measuring the concepts and variables used in a study. In every methodological tradition, researchers use measurements based on the goals of the research, the theory it engages with, and the requirements of their method. Researchers working in different methodological traditions typically have distinct vocabularies to describe their endeavors, and they often use different indicators to measure a concept labeled with the same word but having different meanings. Despite these differences, all comparativists strive for, and often claim to have achieved, measurement validity (see Adcock & Collier, 2001).

Comparativists often describe measurement in terms of levels. Scholars in the quantitative tradition sometimes distinguish their tradition from the qualitative tradition by their use of ordinal- and interval-level data and argue for the superiority of such measures while discounting the value of nominal data such as those used to create typologies. The claim of superiority of higher levels of measurement is based on the ability of statistical researchers to draw fine-gauged distinctions between large numbers of cases. However, qualitative researchers would argue that

such benefits are offset by the uncertainty of fit between such measurements and observed facts. Furthermore, Mahoney (2003), writing in the qualitative tradition, argues that the use of nominal and ordinal measurement is also central to the comparative historical approach and can be put to good use in determining necessary and sufficient causality in small-*N* studies.

While some of this disagreement is in fact substantive, part of it has to do with the relationship between measurement and the goals of research. For researchers in the quantitative traditions who seek to explain the impact of variables on an outcome, statistical models require measures that emphasize control. Furthermore, because such models usually test hypotheses on a large number of cases, researchers must use measures that can realistically be obtained in a fairly consistent manner for each case. Qualitative research designs, on the other hand, emphasize the credibility of measures for each case. Researchers in this tradition are more likely to develop highly nuanced measures of complicated variables, which accurately fit observations about the small number of cases considered. Indeed, in some qualitative research designs, the measurement of concepts may be the goal of the entire research project. Rather than measuring specific variables, formal modelers who use game theory must specify the components of their model, which usually include the relevant actors, their preferences and strategies, the level of information available to the actors, and the possible outcomes of the game. Although game theory does not recommend any specific procedure for conceptualizing a model, it rests on a well-defined set of universal assumptions that guide researchers in deducing these specifications from theory. Nevertheless, the absence of a single method for such an important aspect of modeling means that game theorists must rely on criteria exogenous to the theory itself. Although this encourages multimethod approaches, it introduces an element of potential inconsistency in the overall research design.

Theory Assessment

Given the variety of methods for generating theory, disparate goals of research, and logically distinct methods of data analysis, it is no surprise that different comparative methods also entail different ways of assessing theory. Indeed, both quantitative and qualitative methods mediate the dialogue between theory and fact. But whereas quantitative researchers tend to see a research project as one controlled communication, qualitative researchers are more likely to see the dialogue as a constant back-and-forth between theory and fact. Meanwhile, formal modelers of rational choice theory seek to contribute to theory by modeling the logical implications of its assumptions. These differing views of the nature of research directly impact how scholars use different comparative methods to assess theory.

The quantitative approach usually relies on a single data set to test the observable implications of theory in order to falsify or confirm it. For this reason, quantitative

researchers tend to design studies that rely on a large number of aggregated cases to observe the impact of independent variables on certain outcomes. Such large-*N* studies tend to assume a constant linear notion of causality. That is, they assume that the effects of independent variables on dependent variables are constant for the episode under study and that the causal impact is direct. They further assume that the outcome in one case does not impact the outcome in other cases. In sum, quantitative researchers take a counterfactual view of causality. One way to imagine counterfactual causality is by positing two parallel universes in which everything is the same except the value of a researcher's independent variable that alone explains the presence or absence of a given outcome. Of course, in observational studies, these universes do not exist, so causal inference must make up the gap. By accepting a counterfactual view of causality, quantitative work strives to approximate experimental work. In the absence of the perfectly controlled parallel universe required to carry out experimental research, quantitative analysts use statistical controls to decrease bias and improve the quality of inferences made from observational data.

In the constant dialogue between theory and fact that qualitative researchers undertake, it would likely be impossible to use new data for each encounter with theory. Because qualitative researchers are not generally constrained in their research by the controls of experimental logic, they can use the same data to test and refine their hypotheses. Thus, qualitative research designs tend to favor theory assessment over testing.

One method qualitative analysts use to assess theory is what is known as the *congruence method*. According to Alexander George and Andrew Bennett (2005), the congruence method is one in which a researcher "begins with a theory and then attempts to assess its ability to explain or predict the outcome in a particular case" (p. 181). Thus, it assesses the degree to which there is a fit between a theory's hypothesized causes and a case's observable outcomes. Among the advantages of this approach is that it can assess the ability of more than one theory to explain a given outcome. This is particularly important because it addresses the problem of *equifinality*—that is, that a single outcome may have multiple and unrelated causal paths. But because the congruence method, like many statistical methods, cannot explain why some theories are more congruent with outcomes, this approach is most usefully combined with other qualitative approaches that are more process oriented.

Qualitative researchers have not limited themselves to theory assessment but also seek to test theories using a variety of methods. It is important to point out, however, that a qualitative approach to theory testing differs substantially from quantitative, control-based theory testing focused on falsification. Bennett (2004) describes the goal of what he calls the "mechanism model of theory testing" as "to expand or narrow the scope conditions of contending theories as the evidence demands, and to

identify the conditions under which the particular causal mechanisms hypothesized by these theories interact with one another in specified ways" (p. 50). Such an approach is particularly well suited for addressing the equifinality problem and answering the "how" questions that qualitative researchers tend to ask. It also helps researchers understand why multiple theories are feasible because it can demonstrate how mechanisms from different theories interact with one another.

It should be noted, however, that the causal claims of such a theory rest on a distinct notion of causality that has important implications for how theory is assessed. Quantitative researchers using statistics usually rely on *probabilistic causation*, which assumes that every observable occurrence in the world is the result of at least some random causes that the research is unable to specify. Qualitative researchers, on the other hand, tend to see causality as more deterministic, assuming that every occurrence in the world is fully explicable because it is the result of some prior occurrences. The latter view explains why many qualitative researchers focus on identifying necessary and sufficient causes by specifying the conditions under which a particular phenomenon occurs. These differing views of causality also explain why qualitative researchers may choose to examine anomalous cases, logically positing that if a general theory does not fit for a specific case, then it must be revised. Although most researchers in either tradition are not likely to fully endorse either view, such assumptions about causality are implicit in the methods that researchers choose, and they limit the conclusions that researchers can reach (see Mahoney, 2003).

As mentioned above, the solution of formal models does not in itself constitute an assessment of the theory being modeled; rather, it presents a formal simplification of it. The major output of formal research, then, is not a clear assessment of theory but a set of hypotheses to be tested using a different methodology. Munck (2001) states the situation as follows:

Though models are ultimately assessed in terms of the empirically tested knowledge they generate, the exercise of modeling proper culminates in the proposal of hypotheses. Thereafter, modelers should test these hypotheses. But a formal methodology does not have direct implications for the testability of hypotheses; nor does it offer any guidelines about how to conduct the testing. (p. 200)

Indeed, game theory has been criticized as tending toward "pure theory" because its practitioners have rarely carried out the empirical evaluation their models call for. In response to these criticisms, and in the absence of a method for theory assessment internal to the method, some game theorists have made explicit efforts to lay the foundation for multimethod work. In *Analytic Narratives*, Robert Bates, Avner Greif, Margaret Levi, Jean-Laurent Rosenthal, and Barry Weingast (1998) set forth a method

that combines formal modeling with qualitative analysis, while in *Methods and Models*, Rebecca Morton (1991) demonstrates how empirical statistical analysis can be used to test hypotheses derived from game theory.

Applications

The previous section outlined the ways in which methods mediate the researcher's encounter with theory and fact. An effort was made to show how the choice of methods mediates the scholarly encounter with theory and fact in terms of theory generation, the goals of research, methods of data analysis, and theory assessment. This section discusses three exemplary works in the field to demonstrate how these principles have worked in practice.

Qualitative

In a standard-setting work, Ruth Berins Collier and David Collier (1991) studied the process of *labor incorporation* in a paired comparison of eight Latin American countries: Brazil and Chile, Mexico and Venezuela, Uruguay and Colombia, and Argentina and Peru. These pairs represent what Przeworski and Teune (1970) would call "most different" systems, chosen on the basis of similar patterns of labor incorporation. By contrasting a comparably large number of cases, Collier and Collier highlight the significant differences between Latin American contexts while at the same time making an important theoretical and methodological contribution to comparative politics.

The Colliers situate their study in the literature on bureaucratic-authoritarian models that explain the collapse of democracy as a result of conflicts between workers and owners that arise as countries move from early industrialization to a more advanced economy requiring more intense capital accumulation to produce more sophisticated products. The Colliers critique this economically driven model by placing more emphasis on political factors. The basic argument they advance is that the process of labor incorporation in these states represents a critical juncture in the state's history that shapes legacies both in the short-term "aftermath" and in the long-term institutional "heritage" of a political system. Ultimately, it is these processes that explain why some states experienced the breakdown of their democratic systems whereas others remained more stable.

Their analysis, firmly within the tradition of historical institutionalism (see Thelen, 1999), begins with the emergence of a working class in each state. In nearly 900 pages, they develop a complex historical argument that can only be grossly simplified here. Using both within-case and between-case methods of analysis, they analyze the process of labor incorporation with a particular focus on labor groups, oligarchs, and reformers and the configuration of coalitions among them as they struggle for power. The

relative strength of the oligarchy is seen as particularly important. Whereas a weaker oligarchy provides greater coalitional space for reformers and leads to the mobilization of labor, a stronger oligarchy limits the political space open to reformers, who respond by seeking to control labor. It is important to note that in none of their cases does the working class initially emerge as autonomous, able to effectuate political change on its own. Rather the institutional configuration resulting from elite choices seemed to provide more or less space for labor activism in the aftermath and heritage phases of labor incorporation.

The main methodological contribution of this work is the concept of *critical junctures*. In their analysis, critical junctures are seen much as their ordinary language use would imply, that is, as pivotal moments that transform society and that have long-term effects. Labor incorporation is hypothesized to constitute such a critical juncture, developing along two dimensions, resulting in four patterns of labor incorporation: *radical populism*, *labor populism*, *electoral mobilization by a traditional party*, and *depoliticization and control*. Collier and Collier use historical comparison to test this hypothesis and find that it can at least partially explain the breakdown of democracy in Argentina, Brazil, Chile, and Uruguay and in every case demonstrates that labor incorporation had an important impact on events in the post-World War II era by shaping the political arena of the states under study. Thus, Collier and Collier's historical analysis represented an important theoretical innovation that ran contrary to most analyses of Latin American regimes. The potency of their analysis led many researchers to adopt and reuse their conceptualization of critical junctures as a way to make sense of slow-moving causal processes without reverting to a variable-oriented approach.

Quantitative

The relationship between economic development and democracy is one of the most contentious political issues that comparativists have consistently addressed in the past century. Przeworski and his colleagues Michael Alvarez, Jose Cheibub, and Fernando Limongi (2000) made an innovative contribution to this literature with their book *Democracy and Development*. The central question they address is, how do political regimes impact material well-being? To address this question, they use an inductive approach that gathers data on every country for which data were available for the period 1950 to 1990 and build an argument based on their findings at each step of the research.

First, they choose a minimalist definition of democracy suitable to their research question. Then they derive a set of rules that they use to define the cases in their universe as dictatorships and democracies. Using this descriptive data, they then use *probit analysis* to investigate the relationship between economic development, regime type, and survival. Using *lagged time series data*, Przeworski et al. (2000) then

consider the relationship between political regimes and economic growth. Here they mobilize their data to engage with the long-standing debate over whether democracy hinders economic growth by shifting resources from investment to consumption. After finding that political regime type does not impact economic growth, they turn to the question of political stability. From their exploration, they discover that instability means quite different things under different regime types and has a much greater impact on dictatorships than on democracies. In their final chapter, they investigate the paradox that population growth in dictatorships offsets higher rates of per capita income growth in the same states. Here their counterfactual statistical model leads to the striking conclusion that differences in a range of demographic indicators cannot be explained by exogenous factors but in fact stem from differences in the regime types, particularly the political uncertainty experienced by people living under dictatorships. Thus, each chapter of this study moves from a set of observations to a new set of questions, building a sophisticated statistical analysis, clearly outlined and explained in appendixes at the end of each chapter.

The inductive approach used by Przeworski et al. (2000), however, should not be seen as theory neutral. On the contrary, it is deeply engaged with existing theory, using previous analyses to guide the search. But their primary innovation is methodological. They suggest that most work done on the relationship between democracy and development is inconclusive because it is based on a counterfactual notion of causality but is not tested as such. By deliberately acknowledging the need for a counterfactual approach to causality in their statistical analysis, Przeworski et al. are able to arrive at new conclusions using data largely similar to that of other researchers before them. Among their most important findings is that democracies tend to have higher levels of economic development, not because development causes democracy, but because democracies are more likely to survive if the society is affluent. They also found that although democracies were particularly sensitive to economic crises, they were absolutely ensured of survival if they had reached a threshold level of per capita income. These theoretical contributions flow largely from the logical, explicit research design employed by the research team. In many ways, their study is not typical of quantitative studies in comparative politics. To begin with, they take an inductive approach to address a question that had previously been addressed by many other scholars. Furthermore, they use a series of statistical tests to assess hypotheses derived from an ongoing dialogue with theory that builds on the data being analyzed in the study. Their innovative approach, lucid writing style, and transparency of method have all contributed to this work's endurance in the field.

Formal Modeling

Josep Colomer's *Strategic Transitions* (2000) opens with a powerful and revealing statement: "Transition from

a nondemocratic regime by agreement between different political actors is a rational game" (p. 1). It is clear throughout his analysis that the model he creates is not meant as a metaphor for what happened when the Soviet Union dissolved but as an accurate, descriptive explanation. He does not say that transitions are *like* games but that they *are* games. The question his work addresses is, how is it possible for rationally motivated, self-interested actors to agree on transition? This is an important question, not only because it was historically surprising and unpredicted, but also because it is rare for such dramatic transformations to have taken place in such a short time with relatively little violence. After presenting a historical sketch of the historical background and the circumstances leading up to the fall of the Soviet Union, Colomer deduces the relevant actors and their strategies and preferences. The starting point of Colomer's analysis is that when an authoritarian regime is challenged, there are two possible outcomes: civil war or an agreed-on transition to democracy. In order to model this transition, Colomer uses the prisoner's-dilemma game as well as "mugging" games to identify equilibria. Most methodologists contend that game theory is best applied in situations in highly institutionalized settings such as parliaments or individual voting behavior. One of the innovations of Colomer's approach is that he applies game theory to a situation in which rules and institutional constraints are in flux. He justifies this approach by arguing that the outcomes are well defined and that in such situations, individuals are likely to make an important difference in the outcomes selected. Colomer contends that because the outcomes are known to the actors and because the actors are able to calculate that their choices would lead to suboptimal outcomes, they agree to some binding rules before engaging in the game.

In assessing the implications of this argument, Colomer's analysis draws heavily on the empirical record, but it does so primarily to buttress the argument rather than to test it systematically. He finds that transition by agreement is possible when (a) maximalist actors are weak, (b) the relevant actors are sufficiently strategically distant from one another, and (c) actors are farsighted enough to avoid strategies that result in myopic equilibria. The formal models analyzed are used to identify three models of transition, which he labels *transaction*, *negotiation*, and *collapse*. He then uses these models to explain the separation of the Soviet Union and the *Polish Roundtable*. In a final chapter, Colomer extends his analysis to show how the different models of transition impact institutional choice in the new post-Soviet states. Colomer's innovative methodology clearly achieves the objective of simplifying a complex set of strategic interactions. The delineation of the actors' preferences and strategies is valuable in itself, and the analytical exercise he presents, even if one is not convinced by the strong claim of descriptive explanation that he promises, adds enormously to the literature on democratization and remains an exemplary work of formal methodology.

Future Directions

This chapter has contrasted quantitative, qualitative, and formal approaches and has shown how they mediate the researcher's encounter with theory and fact. Empirical and formal comparative methods were presented, as well as the implications for research design of the three main methodological traditions.

Any such summary will nevertheless pass over the many ways in which researchers working in each of the traditions push and pull the field in different directions. To the extent that the choice of method flows from personal intuition or a well-reasoned belief about what exists in the world and how we learn about it, a researcher may be less flexible or less accepting of approaches that contradict a certain set of principles. Others may be driven by a particular political problem, making them more open to a variety of methodologies but less likely to give value to the generalizations that comparativists often make. Many researchers may also find themselves constrained by their own methodological training, unwilling or unable to invest in learning other methods, and as a consequence, they advocate certain traditions over others even when the traditions' shortcomings are clear. Thus, within each tradition, some researchers push for more methodological pluralism and others work within traditions, seeking hegemony over the research agenda of comparative politics as a field. Both positions can be fruitful and innovative, creating useful methodology syntheses or greater technical specificity for their approaches, but ultimately they have little to do with the ability of comparative research to explain or understand political problems.

Indeed, the community of comparative researchers is methodologically diverse, but its reasons for being so may have as much to do with theory and method as with larger social changes such as research funding, the structure of universities, the overall economic situation, and the quality and character of graduate education. Therefore, changes in these factors will have a great impact on the future direction of comparative politics. For example, publicly funded research projects may be more problem focused and require multidisciplinary team research. If universities rely more on such research grants, they may be more apt at some point to dismantle the traditional divisions of departments based on disciplines such as political science and sociology and replace them with a more research-center-based model in order to more effectively compete for funding. Such a move would dramatically change the character of graduate education and the methods that comparativists rely on to address political problems.

More substantively, one of the reasons that debates about methodology can be so intransigent is that the methods that a scholar chooses reflect assumptions about both ontology (what exists in the world) and epistemology (how people learn about what exists; see Hall, 2003). Quantitative, qualitative, and formal approaches all assume a positivist epistemology, which assumes that researchers

are capable of discovering political realities that exist independently of whether or how they are studied. Yet the positivist underpinnings of these methods have been highly criticized, particularly by constructivists and other critical theorists widely influential in other disciplines. Such approaches, often grouped together under the label of postmodernism or postpositivism, tend to be more reflexive about the role of the researcher and tend to blur the lines between research, theory, and practice. Nevertheless, while the positivist consensus in comparative research does not seem vulnerable to total collapse anytime soon, the post-positivist challenge may be one exciting venue for methodological innovation.

Conclusion

The lack of consensus regarding how to address the substantive questions relevant to the field leads some to question whether the field is maximizing its potential to contribute to the cumulative knowledge about politics across the globe in a systematic way. Some believe that greater consensus regarding methodological choices would lead to faster accumulation of knowledge and improved quality of research, whereas others believe that productive tensions among competing approaches lead to a best possible, if not ideal, outcome. This disagreement springs from questions regarding the purpose of the field and the goals of research.

It has not been possible in this short chapter to discuss the entire range of techniques, models, and games that quantitative, qualitative, and formal modelers use to carry out comparative work. Some of these techniques are dealt with in other chapters of this volume, and many more are described in the additional readings listed below. Nevertheless, an effort has been made here to describe what is at stake when researchers choose their methodology and to provide references to some of the more important methodological works in the field.

CASE STUDIES

CATHERINE L. JOHNSON

University of North Texas

The case study method has always been an integral tool in the investigation of social science phenomena, being of particular value when the number of observations, or cases studied, is limited in number, restricting the utility of statistical approaches. However, for some time the individual case study approach had been supplanted by large-*N*, data-intensive quantitative methods as the preferred technique for empirical studies. More recently, the case study has seen a revival of interest by social scientists as part of a multimethod, holistic approach that includes formal, qualitative, and quantitative methods. Indeed, each major methodological approach plays an important role in the research cycle, with the qualitative application of the case study enlightening the inductive aspect of theory development through the identification of alternate causal explanations, new variables, or complex interactions of variables. Fundamentally, case studies allow one to go beyond often simplistic quantitative analysis and develop contextually rich and in-depth pictures of the phenomena being observed.

By itself, a case study is the history of an event, be it of short or long duration—a civil protest movement, for example, or the evolutionary process from colonial rule toward stable democracy. As such, a case study identifies the expected, predictable aspects of an event, while ideally it also captures additional but less quantifiable detail, such as the cultural context, that potentially asserts a causal role as well. Individual or comparative case studies of specific,

individual events, actors, or systems allow the researcher to obtain a depth of knowledge and understanding about the object being studied that large-*N* quantitative studies fail to provide.

A carefully crafted case study serves several purposes within the research cycle. First, while quantitative studies identify outlying or deviant cases, those well beyond the expected normal distribution, quantitative methods are generally not able to explain the specific reasons for a particular case's extreme variation from its population mean. The case study, however, not only provides the opportunity to identify likely reasons for these individual deviations but may illuminate previously unidentified causal variables and possible alternate explanations as well. This information potentially leads to the extension of existing theory, if not its revision, and may suggest new theoretical explanations altogether.

Additionally, the case study may be the best, or only, way to study certain phenomena because of the relatively small number of identified cases and a resulting scarcity of data, which restricts the use of quantitative methods. And while much of the earliest criticism of case studies (by social scientists) centered on their application as a mainly historical narrative, the substantive purpose of case study is to understand that history but to do so in a way that allows for the identification of critical actions, structures, or other aspects that contribute to the end result. Being able to examine with scientific rigor phenomena that either

do not lend themselves well to quantitative study, or for which only a limited set of objective measures is available, makes such an approach valuable. The role case studies can play in identifying and understanding previously unknown variables and in establishing causal paths and the interdependency of variables, as well as being critical tests of existing theory, makes them not just a complement to quantitative methods but potentially of equal value (Geddes, 1990; Gerring, 2004).

Case studies are by definition qualitative, meaning that the focus of the study is not primarily the systematic manipulation of aggregated points of data, an objective exercise, but rather a study that focuses on the quality of the potential data observed, a much more subjective work. This is not to say that case studies are not objective as well: In reality, for a case study to have any influence, it must identify and measure variables to allow for reliable comparison and to build theory that is testable, replicable, and generalizable. Case study is ultimately a method that falls into two forms: the *individual, within case study* and the *comparative across case study*, usually limited to a small number of cases. Both types work to identify causal relationships and enlighten theoretical explanations. Good case study work can be either *accumulating* (building on previous knowledge) or *original* (establishing entirely new avenues of research).

The Debate Within the Discipline

Political scientists have had an ongoing discussion about the role of the case study approach in their field. This discussion has focused on the relative value of case study compared with other methods for evaluating and advancing theoretical understanding. Of central concern is the perceived methodological limitation of single and small-*N* case work within a discipline that favors quantitative methodologies. A tension results between the benefits accrued from this method and its limitations. What value can a unique examination contribute? Are hypotheses and theory valid only if they are testable and generalizable? Within these debates over the fundamental usefulness of deliberative case study work are questions that address both the inherent strengths and weaknesses of such an approach. Scholars have generally fallen into two camps, those who argue for its usefulness and those who contend it has limited utility in a discipline with a strong quantitative emphasis and reliance on scientific method.

Addressing this fundamental question over the potentially ambiguous nature of a case study finding, which alone can neither directly inform nor disprove a generalizable finding, Arend Lijphart (1971) states that because of its singular nature, the case study in and of itself does not directly satisfy the standards of scientific research. He does, however, credit the case study with multiple *indirect* benefits, making it a valuable component in establishing political science theory. He identifies six types of case studies that fall into roughly two categories: those chosen because

the case itself is of interest and that are purely descriptive and those chosen to inform and build theory. The first category encompasses single case studies, which are generally detailed histories of a specific event or result and which, he argues, have value for this history alone. The thorough knowledge of a country gained by such an intensive, rich study provides critical information that others can also benefit from. Additionally, these in-depth analyses not only are a source of data for larger comparative studies but may also identify new variables of interest or suggest potentially new theoretical explanations. Lijphart's other typologies include those case studies that are chosen specifically for theory-building purposes. They include hypothesis-generating cases in areas in which no established theory exists; theory-confirming and -informing cases, both of which test existing theories; and deviant case analysis, for cases known to have varied from the expectations predicted by theory. This third type of case often reveals additional variables previously unidentified. It may suggest a temporal ordering of variables (path dependency) or identify the sometimes critical interactions of variables. The study of deviant cases may merely suggest refinements to the way variables are operationalized within the study, still an important theoretical contribution. These last three case typologies constitute the core of comparative case study, with their usefulness coming from their deliberate selection as a test to existing theory. While Lijphart identifies certain benefits of the case study approach, his praise is still conditional, and he favors the value of large-*N* quantitative studies whenever possible.

Harry Eckstein (1975) addresses the utility of case studies by first noting the predominant status held by historiographic work in earlier political science research. His main contention is that this early case study work, at both the micro and the macro level, although insightful in its own right, was perceived to be severely limited in its usefulness for producing generalizable theory, because of its singular focus and the statistical consequence of an *N* of 1. The prevailing assumption was that what theory-building utility case study work had was inductively drawn from the events studied, and those inferences might or might not represent replicable conclusions. Eckstein questions this assumption and lays out a detailed argument supporting the utility of case study work in all stages of the theory development process, not just the nascent ones. He additionally contends that case studies may actually be most valuable at the theory testing stage. Particularly in the field of comparative politics and when studying complex, potentially unique systems, Eckstein suggests that well-designed case study methods may be the best way of testing hypotheses and cumulating generalizable theories. Indeed, he emphasizes the role of case study in its comparative application and perspective.

Before he makes his argument for the value of case study to theory building, Eckstein (1975) provides valuable definitions of case study by emphasizing the concentrated, yet flexible, aspect of an investigation into a single event or individual. This focused yet not narrowly defined

approach allows the investigator to be open to unexpected observations and new conclusions. Eckstein additionally makes the important distinction that the study of one event does not necessarily mean only one measure of the results. Rather, he contends that how an event or thing is studied will dictate its number of observations. Thus, one event can be broken down into numerous observations. For example, “A study of six general elections in Britain may be, but need not be, an $N = 1$ study. It might also be an $N = 6$ study. It can also be an $N = 120,000,000$ study” (p. 85). This example illustrates his definition of a *case* as the single measurement of a pertinent variable observed, so that *comparative study* is then defined as “simply numerous cases along the same lines, with a view to reporting and interpreting numerous measures on the same variables of different ‘individuals’” (p. 85).

After he provides a useful review of the steps toward the development of theory, first the question or puzzle, followed by the formulation of a hypothesis and then a test, with the cycle likely repeating itself as refinements are made, Eckstein proceeds to describe five distinct varieties of the case study and identifies the particular uses each has. The first of these, the *configurative idiographic study*, is meant to be a comprehensive study of its target but one that allows for intuitive interpretation of the facts. By definition, *idiographic* is individualizing rather than nomographic or generalizing. Indeed, Eckstein acknowledges that this type of case study was the predominant type he first alluded to in this work. But he makes the point that the strengths of these types of case studies are their very weakness. Their rich description and often persuasive intuitive interpretations may be individually factual, but they aren’t systematic, which makes generalizable conclusions problematic and substantive theories unlikely.

The *disciplined configurative study*, a term Eckstein (1975) credits to Sidney Verba, turns this relationship around somewhat; rather than building theories on interpretations, interpretations should be driven by theory. This implies that the details of a case should either confirm or disprove a theory that ought to apply to it. The problem with this approach is, as Eckstein points out, its “discipline.” The strict and usually narrow application to a case of a hypothesized theory should either confirm or deny it. In essence, Eckstein suggests that this approach may be too restrictive. It may also lack the flexibility to accommodate more intricate relationships not already identified or suggested by existing theory. He also worries that interpretation of cases on an existing theory presumes that the theory itself is correct and suggests that existing theory, however valid, may “*compel* particular case interpretations” (p. 104, italics added) with its emphasis on generalizability at the expense of more individualized findings.

Eckstein’s (1975) third type is *heuristic case studies*, which are deliberate searches for discovery, often a result of trial and error. These are meant to be creative, stimulating the imagination of the researcher toward new ways of looking at a problem, focusing on broader, more generalizable

relationships. This discovery is incremental and is often developed in sequential studies as the new theory is further refined. The reason for heuristic case study is given rather succinctly by Eckstein: Theories do not arise from data alone but rather from the imagination of the researcher, after discerning puzzles and then patterns. Case studies, with their intensive analysis, increase the likelihood that these critical relationships will be found, particularly when they are carefully chosen to advance theory building. One caveat Eckstein offers on heuristic case studies is that they often produce too much—multiple explanations, too many variables, and a resulting complexity of interactions that are not only unwieldy but make generalization impossible.

Case studies are also used to probe the likelihood of proposed theories, a form that Eckstein (1975) calls *plausibility probes*. These are an intervening step before testing, to determine whether the expense of testing is warranted. Although the usefulness of such a study is limited to this end, and alone it cannot confirm a theory, it can, however, improve the prospects of testing, and for this reason it has value.

A more critical example of case study in theory building is the *crucial case study*. Eckstein (1975) confronts the dilemma of a single observation and the inability to correctly determine a statistical relationship on the basis of such limited information as a source of potential error for any theory based on it. The *inductive fallacy* is the error made when one derives a theory from only the observed (gathered) data, without further testing. The critical caveat is that one cannot test a theory with the same data used to originate the theory, and therefore another such example must be found. The *crucial case* is just such a test of a proposed theory. If all those variables deemed critical to a theory exist, then the results should be as predicted by the theory. Conversely, one can study a case similar in most respects, yet lacking in the hypothesized critical components, as a way of demonstrating that similar results did not result because the causal variable was missing. Although these *most likely* and *least likely case study* designs cannot absolutely confirm or deny theory, they are important tests of the likelihood of the theory and the correctness of the causal relationships being proposed.

Eckstein’s (1975) thorough typology and analysis of the case study method methodically crafts an argument for the benefits of case study work. These include the insight made possible by the rigorous, thorough inspection in a carefully crafted case study and its across-discipline utility in identifying new variables and new causal mechanisms leading to the generation of new theory. To accomplish this goal, Eckstein emphasizes that case study selection must be driven by theory, and not by interest or convenience.

Charles Ragin (1987), in *The Comparative Method*, devotes a chapter to the discussion of case-oriented comparative methods and addresses the likelihood that even the most meticulously performed case study is unlikely to

produce definitive explanations. However, identifying critical contextual facts may help determine the causal relationships underlying the observed phenomena. It is important to note that Ragin emphasizes the value that an intensive case study accrues to its researcher. Deep understanding of an event or case in its entirety, rather than merely knowing pieces of information, allows for more contextually rich comparison to other events. This richness can only enhance the reliability of the causal inferences drawn. Such depth of knowledge is likely limited to a small number of cases, and indeed this complexity is a constraint on the case study researcher. Case study is, as Ragin shows, a successful strategy for analyzing complex, multicausal events and at the same time still cohesively connecting them theoretically. He concludes with a nice summation of the strengths of the case study method: Case studies make possible the discovery of patterns of relationships and difference, with all deviations requiring an explanation, necessitating a thorough knowledge of the data. Since case study work does not rely on statistical probabilities such as frequency or distribution, a single case can be critical and can potentially prove or disprove a hypothesis. Case study work is holistic and requires a thorough understanding of the entire event, not just targeted aspects of it, and finally, case study encourages creative new ways of examining behavior and events. Particularly in the identification of complex interactions and the importance of context in understanding their role, Ragin makes the point that case studies provide a methodologically distinct approach.

In *Designing Social Inquiry*, Gary King, Robert O. Koehane, and Verba (1994) argue that the same level of testable, scientific rigor can be applied to qualitative work that quantitative scholars are able to use in their statistically based work; qualitative work includes, of course, case studies. King et al. focus on research design with an emphasis on the logic of inference, to use the facts that are known to learn about facts as yet unknown. This is then used to identify causal relationships and construct theories that can then be tested. King et al.'s emphasis on the latter stages of research design, producing theory that is testable and thus falsifiable, challenges case study researchers to think rigorously about their work, to recognize the similarities of quantitative and qualitative work with respect to empirical rigor, and to approach their work as such. King et al. argue that the primary way to do this is to see qualitative data more quantitatively, and to accomplish this from a practical standpoint, they advise maximizing the number of observations (from which measures are taken) whenever possible. At the same time, when adding an observation is not possible, they recommend summarizing on the outcome of interest instead, in order to avoid issues of *micronumerosity* (having more variables than observations). Echoing Eckstein (1975), King et al. remind us that the size of a case study, its *N*, is often determined by the level of analysis chosen: Is it one single event, several incidents within that event, or many more individual acts? In addition to

constructing a design that allows for multiple observations, the authors emphasize the requirement of designing theories that can be falsified (i.e., the null hypothesis can be tested). King et al. also address the importance of reducing the potential bias introduced through case selection. They emphasize the care with which cases must be chosen, as there must be "the possibility of at least some variation on the dependent variable" (p. 129). Other potential sources of selection bias they cite are investigator induced: choosing cases because data are available or because one has a particular interest in or understands the language, or the larger bias that often occurs when case selection is correlated with the dependent variable. In this instance, the process being studied has already been selected for over time, leaving as evidence only its most recent iteration and losing any obvious trace of what may have been critically important in the intervening stages.

Not all scholars implicitly agreed with the arguments made by King et al. (1994), and a lively review symposium in response to it appeared in the journal *American Political Science Review*. In it, Ronald Rogowski (1995) challenges King et al.'s concern with the testability of single-observation studies and relates three examples of just such single-case studies that do succeed under this limitation. He offers additional examples in response to their admonitions against dependent variable selection bias and comments that without deliberate selection based on a case's anomaly (its status as a statistical outlier), one of the core benefits of case study work would be lost. Rogowski sums up by emphasizing the importance of not losing the benefits of good qualitative work at the expense of increased quantifiability. In the same symposium, David Collier (1995) also takes issue with how King et al. address selection bias. However, although Collier generally concurs with their position, he argues for a bit more nuance when one is faced with some of the realities of the comparative method. Additionally he identifies the importance of valuing the context of research findings as more important perhaps than their generalizability, and he gently suggests that King et al. could be less rigid in their appraisal of qualitative methods.

Since case study is just that, an intensive examination of at least one item, how cases are selected is a fundamental issue. In comparative case studies, this issue is particularly relevant because small-*N* studies suggest that there exists more than one unique example of what is being examined and therefore a larger population to choose from. As a result, concerns over potential selection bias contribute prominently in discussions of the case study method. In "How the Cases You Choose Affect the Answers You Get: Selection Bias in Comparative Politics," Barbara Geddes (1990) addresses this issue by reexamining three prominent comparative studies. She neatly demonstrates how the potential error of case selection on the dependent variable can particularly impact results in small-*N* studies. Essentially a primer on selection bias, this article outlines the importance not only of identifying the most likely causal reasons some event occurred, but also of examining

the counterfactual as well. Geddes makes the point that by not providing a larger sample, selected randomly (rather than on the dependent variable) for testing the proposed relationship between cause and effect, one is really comparing only “the differences among the selected cases” (p. 132). She then shows how such an error can also occur in a path-dependent argument. In both examples, misleading findings resulted from researchers’ not expanding the population from which the targeted cases were drawn. Had they done so, they would have had a larger and likely more random sample to test. Geddes’s final example involves time-series studies and the determination of the appropriate end point of a case study. In this instance, she shows how changing the dates of a study would affect its results drastically, and she also makes the point that historical case studies are especially vulnerable to selection bias based on the time frames chosen for analysis.

The more recent discussion of case study work has focused increasingly on understanding the role of this method as part of a comprehensive research strategy. John Gerring (2004) emphasizes how, by failing to accommodate the bounded aspect of case work, most commonly used definitions for case study are inadequate. He offers the definition of case study as “an intensive study of a single unit for the purpose of understanding a larger class of (similar) units,” with units being “spatially bounded phenomena” (p. 342). This implies the study of a unique event or thing, at one point in time, with the goal of generalizability, which, he argues, provides a more theoretically useful interpretation. Gerring then provides a comprehensive discussion of the methodological ambiguities that occur in case studies and identifies six areas in which case studies are vulnerable. With these as a guide, he outlines the strengths and weaknesses of case (within-unit) study versus across-unit study. He notes that the case study method is more suited to descriptive inferences than to causal ones. It is a method that has a special affinity with intensive, focused studies rather than those that are extensive and broad. Case study is more likely to have high internal validity and weak external validity. It facilitates the defining of causal mechanisms, and not the testing of causal effects, performing better when causal mechanisms are deterministic instead of probabilistic. Finally, case studies are well suited to exploratory research but are limited in their uses for confirming hypotheses, yet they are preferred when across-case studies cannot provide adequate variance for the relationship being studied. With this enhanced clarity, and by situating case studies not apart from but as a complement to non-case methods, Gerring suggests that case study methods should be accepted as an equally worthy methodological approach by the entire discipline and that rather than favoring one method over another (often exclusively), scholars should use the method most suited to their question, their data, and their theory.

With Alexander George and Andrew Bennett’s (2005) *Case Studies and Theory Development in the Social*

Sciences, the debate within the discipline over case studies is brought up to date. Both authors have been longtime advocates of case study methods, and this latest work is a very thorough argument for the value of case study methods as part of a research strategy that includes both quantitative and qualitative methods as well as formal theory (Bennett, 2004, offers a chapter-length article distilled from this material, as well). George and Bennett disagree with King et al.’s (1994) contention that there can be only one “logic of Inference” (p. 11). George and Bennett discuss the relationship between case studies and the systematic building of theory. They compare the strengths and weaknesses of case studies and first identify four strengths, all areas in which statistical methods tend to be weak. These include concept validity, the potential for discovering new causal variables and deriving new hypotheses, a better understanding of the relationship between causal variables and possible path dependency, and the ability to identify or model the complex interactions of these variables. Weaknesses of case studies include the potential for introducing selection bias from the cases chosen and the inability to accurately measure the relative strength of an effect. Also, because of their single or very small number, case studies are relatively unique and not necessarily representative; cases chosen from a small pool may not necessarily be independent of one another, and they do not have a rich number of observations from which to judge the strength of associations between variables. George and Bennett advocate the use of the *structured, focused comparison*, which allows for the collection of data that can be systematically compared with other cases as well as accumulated. In this way, scientific rigor is added, and the utility of case methods is likely increased. The authors then outline the method of case study, from designing the research to executing the study and to drawing conclusions from the findings. In all steps, the role of theory is predominant: It drives the design and motivates the findings. In addition to being the definitive authority on case methods, George and Bennett present a compelling argument for using multiple methodological approaches in a research program. Not only do they show how qualitative and quantitative methods complement each other; they integrate formal modeling as well. This approach is gaining momentum in political science today, making a qualitative skill set not merely useful but necessary.

Examples of the Case Study Approach

U.S. Politics

In the field of U.S. politics, the classic example of a grounded, participant observer case study must be Alexis de Tocqueville’s (1835/2004) *Democracy in America*. Although most modern scholars of U.S. politics solve their *N* of 1 problem by focusing on the subunits of U.S.

government, using states or administrations, court terms or congressional voting records as their unit of analysis, Tocqueville analyzed the United States as a single entity. He drew his conclusion, that it is citizens' affinity for joining in and participating at all levels of civic life that strengthens democracy and enables it to flourish, from his personal observations as he extensively toured the country in the early 1800s. A more modern work in U.S. politics that is rooted in qualitative case study work is Richard Fenno's (1978) examination of congressional members, *Home Style: House Members in Their Districts*, in which he used extensive interviews and considerable time observing congressmen, both in Washington, D.C., and, critically, in their districts. This self-styled "soaking and poking" enabled a comprehensive, in-depth observation that allowed Fenno to identify the paradox of individual representatives' being very well-liked by their constituents at the same time as the institution of Congress is collectively viewed much more critically, and he explains much of the paradox by the personal relationships developed through district service. David Mayhew's (1974) *Congress: The Electoral Connection* also looks at the relationship between members of Congress and their constituents and is another example of a work based on inductive reasoning rooted in extensive in-depth participant observation. Mayhew finds that it is the incentive for reelection that motivates the individual behavior of both congressmen and the Congress. Through committee assignments, leadership positions, and vote trading (among other means), congressmen ensure their reelection chances. Mayhew suggests that with Congress motivated as a whole by mutual self-interest, it is no surprise that the structural arrangements of Congress, its organization of the leadership and committee system, have evolved to facilitate this behavior.

Comparative Politics

The case study method is used most extensively in the subfield of comparative politics. Using primarily small-N research designs, many significant works have been produced. Included among these is Barrington Moore's (1966) *Social Origins of Dictatorship and Democracy: Lord and Peasant in the Making of the Modern World*. Moore examines five societies to compare their experiences with modernization and the economic revolution that ensues. He concludes that there are three likely outcomes, dependent on the country's social structure, and these in turn predict the likelihood of a successful transition to democracy or descent into dictatorship. The most well-known example of an intensive single-country case study must be Robert Putnam's (1993) *Making Democracy Work: Civic Traditions in Modern Italy*, also an excellent example of historiographic work. The subject of lively debate within the discipline, *social capital*, that is, the extent to which citizens are participatory and invested in their communities as a result of their civic relationships, was found by

Putnam to be a necessary component of a successful democratic society. Putnam argues that the associational experience of northern and central Italy developed interpersonal trust and fostered more democratic local governments, but the lack of similar groups in the south left them with less. Another such single-case work is Robert Bates's (1989) *Beyond the Miracle of the Market: The Political Economy of Agrarian Development in Kenya*. This work, which focuses on the intersection between land use, government institutions, and public policies, relies on a critical understanding of the economic, political, and cultural forces at work in Kenyan society. The complex interplay of economics and politics that Bates studies is only fully appreciated when the cultural context is included; the influence of tribal affiliations and Kenya's British colonial legacy are just two examples. These kinds of rich, multilayered observations and intimate knowledge of a society can be accomplished only with case study methods, with which Bates combines quantitative rigor as well.

International Relations

International relations scholars have also extensively used the case study method to selectively examine the actions of elite actors and organizations during critical events. Case study work is used to evaluate existing theory as well as propose alternate explanations to better understand the often complex motivations of and among nation-states. In *Essence of Decision: Explaining the Cuban Missile Crisis*, Graham T. Allison (1971) examines the Cuban missile crisis and, primarily through interviews, reconstructs the often conflicted decision-making process of all the major participants. To do this, he approaches the same event from the perspective of three different decisional-behavior models. These competing approaches are collectively used to illustrate the author's thesis: that despite internal pressures to the contrary, it was the actions and the decisions of the two leaders that successfully resolved the issue. Alexander George and Richard Smoke's (1974) *Deterrence in American Foreign Policy* is an example of a focused-comparison case study that examines 11 instances of the failure of U.S. deterrence policy. George and Smoke use process tracing to establish the causal explanation, which would not be possible without the depth of knowledge acquired in these case histories. In doing so, they critique existing theory and are able to offer a new, more dynamic, explanation. In another example of a focused-comparison study, Stephen M. Walt (1987), in *The Origins of Alliances*, looks at alliance formation and contrasts two distinct types: those made for mutual support to defend against a threat and those that are more opportunistic (or perhaps pragmatic), in which one aligns with the threat itself. Walt then explores the likely causes of these choices, looking specifically at shared ideology and the influences of foreign aid. His concentrated case study of states in the Middle East during a single period allows

him to develop the depth of knowledge necessary for such a study, in which data alone would be inadequate.

Conclusion

As the previous examples illustrate, case study work is applicable to a broad range of theoretical questions. Indeed, for many situations, a case study examination is the only way to rigorously examine an event. Case study can be used in either half of the research cycle: to deductively test the hypothesized research question or to inductively explore the results of empirical observations. It is also a valuable method for developing original theoretical insight, which can often form the basis of a research design using more statistically robust methods. Case study in and of itself serves a vital informative purpose as well, allowing in-depth appreciation of often nuanced yet critical conditions of the larger phenomenon being observed. Finally, the case study is increasingly being appreciated as a necessary component of comprehensive political science research today: Together with traditional quantitative methods that provide reliable statistical probabilities for a tightly focused view, and formal theory methods that produce more soft-focused or abstract explanations, case study work provides a necessary contribution by filling in the gaps, compensating for the inevitable shortcomings when formal and quantitative methods are applied to real-life questions and problems. Most critically, a well-crafted case study gives the researcher a level of knowledge and understanding of the matter being examined that no other method allows. This benefit alone justifies the application of case study methods to social science research today and in the future.

PART III

INTERNATIONAL RELATIONS

HISTORY OF INTERNATIONAL RELATIONS

ANTHONY D. LOTT

St. Olaf College

As a field of study, international relations (IR) is a young discipline. Its genesis can be traced back to the period immediately following World War I. In the aftermath of the war, philanthropists, scholars, and diplomats in Europe and the United States sought an understanding of the causes of war and the means by which to promote international peace and security. At its core, the initial study of IR was both normative and empirical. Normative IR theory seeks to provide a set of values that policymakers, diplomats, and other actors should follow in order to better the human condition. Empirical IR theory seeks to explain the underlying causes of political events. Originally, IR had the normative desire to achieve pacific relations between states and an empirical concern with investigating the underlying causes of war and conflict.

With this narrow focus on interstate conflict, the original scholars in the field drew their theoretical insight from philosophy, history, law, and economics. Early scholars began a practice in IR of drawing on the philosophical works of Thucydides, Niccolo Machiavelli, Hugo Grotius, Thomas Hobbes, Jean-Jacques Rousseau, Immanuel Kant, and others in search of a proper understanding of the causes of war and the potential for peace. The study of past historical events was used to develop general principles that might be employed to resolve current and future conflicts. The growing importance of international law as a tool for states

would be used by IR scholars to frame theoretical approaches promoting peace and security. In the decades following World War I, departments of IR emerged in Great Britain, Switzerland, and the United States to train diplomats and policymakers and further the theoretical study of the discipline.

Although the discipline began by focusing on the causes of war and the potential for peace, the complexities of world politics and the emergence of globalizing forces throughout the 20th century expanded the scope of IR to include the study of human rights, migration, environmental cooperation, economic development, ethnic conflict, nationalism, terrorism, and international crime. Today, IR scholars have developed sophisticated theories and models in order to study an ever-expanding set of issues and concerns. Constituting one of the main subfields in political science, IR continues to demonstrate how political power defines this growing set of issues and concerns.

In the discussion that follows, the historical emergence and intellectual scope of the discipline are explored by examining the development of IR theory throughout the 20th century as well as the broadening list of empirical issues analyzed by IR scholars. Following this review, the future direction of IR is discussed. At the end of this chapter, a list of further readings is provided that introduces the reader to the themes introduced and the concepts explored.

Historical and Theoretical Developments

Liberal Beginnings

In 1919, a wealthy Welsh industrialist by the name of David Davies provided funds to the University of Wales at Aberystwyth for the purpose of studying international relations. After witnessing the carnage of World War I, Mr. Davies was intrigued by the ideals represented in the League of Nations and dedicated funds to endow the Woodrow Wilson Chair of International Politics with a belief that humankind could overcome war. Sir Alfred Zimmern, a British historian, became the first scholar of international politics when he accepted the post of Wilson Chair. His work is characteristic of early scholarship in IR and focuses on issues of economic interdependence and cooperation through international treaty law. Believing that scholars could make a difference in the world around them, Zimmern and other liberals of his time sought practical institutional solutions for the problems of conflict in the world. This focus on institutional solutions would come to dominate early discussions in the discipline and exemplifies liberal IR theory. He had an interest in and affinity for the League of Nations as a mechanism to prevent conflict and promote prosperity and peace among states. Many of the liberal IR scholars of the time, including Alfred Zimmern and Norman Angell, were active in League affairs and accepted the political position of contemporary leaders like Woodrow Wilson, who argued that self-determination for peoples and state membership in organizations like the League could create the foundation for international cooperation and the transcendence of war as a policy of the state. The pinnacle of liberal IR thinking that understands law as the basis for peace is the Kellogg–Briand Pact, an international treaty formally titled the Pact of Paris that outlawed war as a policy tool for states in the conduct of their foreign affairs. This treaty was signed by more than 60 states and exists today as a reminder of institutional attempts to transcend conflict through international law. By outlawing war among the signatories, the treaty established a legal basis for trying state actors who violated the provisions of the treaty. Further, the treaty provided a solid foundation for a set of international norms limiting the use of violence in international conflict and constraining the actions of states.

For early liberal IR scholars, the international community had the potential to use international organizations, international treaty law, and state diplomacy to solve problems. When constructed correctly, agreements negotiated by diplomats, written into law, and managed by proper organizations could resolve long-term international conflicts. Political challenges posed by World War II and the cold war would require certain refinements to liberalism in the 1970s, but the core belief in the possibility for change and the potential to overcome conflict still remains among liberal theorists. (For a more detailed discussion of liberalism, see Chapter 38, “Idealism and Liberalism.”)

Realist Critics

Throughout the interwar period, as the period from 1919 to 1939 would come to be called, scholars concerned with a focus on institutional mechanisms to overcome interstate violence challenged liberal IR theorists by emphasizing how enduring laws of power and the inevitable consequences of an international environment defined by a lack of a global government (anarchy) undermined institutional attempts to achieve peace. Exemplified in the classic E. H. Carr (1940) book *The Twenty Years' Crisis: 1919–1939*, realist IR theory focused on state concerns with security and the ever-present quest for power. There had been great concern among realists that liberal scholars and diplomats had a naive interpretation of international affairs and an idealistic faith in legal and institutional solutions as a means to solving potential conflicts. Accordingly, liberals had underestimated the potential for states to dismiss their legal (treaty) commitments and withdraw membership from international organizations when their national interest ran contrary to that law or organization.

Realists argued that scholars needed to develop a more sophisticated understanding of the causes of war. The normative desire to prevent war, although noble, undermined a clear understanding of its causes. As IR scholars, realists insisted that scholars seek a better understanding of what caused international violence in the first place. Writers such as E. H. Carr (1940), Hans Morgenthau (1948), John Herz (1950), and others labeled liberal IR scholarship “utopian” because of the liberal reliance on institutional solutions. These realists offered a vision of international politics where the potential for war required scholars and diplomats to mitigate its effects rather than seek its transcendence. According to realists, there was a set of conditions that prevented humankind from transcending war as policy. Human nature, often defined as a quest for power, and the anarchical environment limited the effectiveness of institutional solutions to prevent war. Reviewing the Kellogg–Briand Pact that liberals extolled as a sign of moral and political development in international affairs, realists noted that by the beginning of World War II, many of the pact’s signatories were occupied by, or at war with, other signatories.

Policymakers, realists argued, should recognize and internalize the important lessons of the Thirty Years’ War (1618–1648). The peace treaty that ended this European war established sovereignty as a defining principle of each state and required each state to defend against external aggression rather than rely on other states for their defense. Sovereignty, or the principle that states have control and autonomy over their physical territory and the citizens or subjects in that territory, would come to dominate realist scholarship. (For a more detailed discussion of realism, see Chapter 37, “Realism and Neorealism.”)

Marxist Alternatives

During this early period of theory development, a third approach to understanding the causes of war and the

mechanisms for peace was emerging as a critique of both liberal and realist IR theory. Emerging from the works of Karl Marx, Friedrich Engels, and others in the last half of the 19th century, Marxian scholars introduced a radical retelling of international relations. These scholars explored how particular class interests captured the power of the state and harnessed its foreign policies in order to promote their interests. This approach challenged both liberal and realist conceptions of the state as a neutral agent with regard to the citizens or subjects within. When understood to be in the interest of the propertied (or bourgeois) class, the state was engaged in a policy of expansion and imperialism. War, as state policy, could be understood as the means by which states would expand access to commodities and markets abroad. Moreover, opportunities for increased profits during war made it a profitable enterprise for the capitalist classes. Since the burden of battle was borne by the lower classes, Marxist IR scholars emphasized how war was the result of a particular economic system.

This radical approach to IR challenges liberalism and realism in two ways. First, as a moral critique, Marxism explores how capitalism, as an economic theory, undermines the human capacity for empathy. As a basis for the economic ordering of society, capitalism results in the exploitation of certain human beings and the alienation of all human beings. Once alienated, human beings become objects to be used just as the state might use any other weapon of war. Georg Lukacs (1971), a German philosopher writing in the early part of the 20th century, explores these moral criticisms of capitalism in *History and Class Consciousness*. His examination of human alienation has been used by subsequent Marxist IR scholars to explain how modern warfare dehumanizes people. Marxism also critiques the empirical rationale for war. Because capitalism requires that markets grow, war becomes a necessity. Capitalists must employ the state in war making in order to increase profits. V. I. Lenin (1916/1964), in his analysis of the causes of World War I, explores this issue in *Imperialism, The Highest Stage of Capitalism*. (For a more detailed discussion of Marxist ideas in IR, see Chapter 39, “Dependency and World-Systems.”)

Economic Interdependence and Global Security Challenges

After World War II, the historical trajectory of IR was altered by two significant factors in world politics. First, the emergence of a new international economic order, increasing global trade and financial flows among states, prompted scholars to adjust the mainstream theories of liberalism and realism. In 1944, policymakers of the Allied states met at Bretton Woods, New Hampshire, in the United States to negotiate institutional structures to manage the postwar global economy. At the conclusion of this international conference, the states in attendance agreed to create the World Bank (known originally as the International Bank for Reconstruction and Development), the International Monetary Fund (IMF), and the General Agreement on Tariffs

and Trade (which became the World Trade Organization in 1995). These institutions, and the norms of free trade, financial transparency, monetary stability, and economic integration that uphold these institutions, offered IR scholars additional variables to study in order to understand the causes of war and the potential for peace.

In a historical context, the development of these economic institutions demonstrated the importance of the liberal economic idea that global peace would be enhanced if states cooperated through trade and monetary policies. Often called neoliberals, scholars have explored how states in international relations create long-term cooperative arrangements that endure throughout the decades. Scholars such as Robert Keohane (1984) continue to study the implications of an increasingly global economic order. Their focus is on the complex web of governance rules. International governance occurs in conditions of anarchy, where government does not exist. However, even without formal government, neoliberals demonstrate how governance rules proliferate among the states in international relations and order their behavior. It is often the case that these governance rules proliferate because international regimes have been created to enhance the cooperation among states. The term *international regimes* refers to sets of principles, norms, rules, and decision-making procedures around which actors converge on a given issue area (Krasner, 1983). These regimes exist without the need of a formal government structure. Regimes function to provide a level of ordered and predictable governance among states in international society. An example of how regime cooperation has limited the spread of nuclear weapons follows.

In addition to scholarship on international governance and the importance of regimes, neoliberal scholars have employed the shared values that democratic states have in maintaining liberal economic conditions to study a separate peace that appears to develop among democratic states. Scholars such as Michael Doyle (1986) have explored this democratic peace hypothesis, arguing that sovereign states with market economies, limited government, civil rights, and representative government do not go to war with each other. This represents a direct theoretical challenge to realism. If neoliberals are correct and the type of government matters in terms of the potential for interstate peace, then the proliferation of democratic states should reduce the likelihood of war in the future. A world made up of democratic states could allow for the transcendence of interstate war as a policy possibility. (For a further discussion of these studies, see Chapters 38 and 39, “Complex Interdependence and Globalization” and “International Political Economy and Trade.”)

A second challenge to traditional IR theory emerged after World War II with the advent of nuclear weapons and the global security threat posed by U.S. and Soviet hostilities during the cold war. Previous security threats involved state aggression and the proper international response to that aggression. The threat posed by great-power nuclear weapons required scholars to imagine global nuclear annihilation. A deterrence strategy known as MAD, or mutually assured

destruction (for a more detailed discussion of this topic, see Chapter 44, “Deterrence Theory”), emerged among strategic studies scholars and influenced the national security strategies of both the United States and the Soviet Union. In the 1960s, IR theorists debated the relative stability of an international system in which nuclear weapons existed as a global threat. Many realists (Art & Waltz, 1971; McNamara, 1968; Newhouse, 1973; Schelling & Halperin, 1961) outlined the merits of a MAD environment where states would learn that use of nuclear weapons would result in their own demise. This, they argued, would create a level of stability in international affairs and minimize the likelihood of systemwide wars. Scholars in other traditions (Bennett, 1962; Clancy, 1961; Dyson, 1979) contended that the potential for accidents or the irrational actions of one individual who did not learn the lessons of MAD could place billions of lives in peril.

Although the theoretical and moral debates remain ongoing in IR theory, the presence of nuclear weapons in world politics has led to broad agreement among diplomats and policymakers that access to nuclear technology should be regulated at the international level. The international community has developed an intricate set of principles, rules, norms, and decision-making procedures to limit access to nuclear technology and minimize its proliferation beyond a small group of declared nuclear states. These components constitute the nuclear nonproliferation regime. Actors in this regime include declared nuclear powers, the United Nations Security Council, and the International Atomic Energy Agency. The regime is centered on a multilateral treaty, the Nuclear Non-Proliferation Treaty. Each of these components includes a set of principles, norms, rules, and decision-making procedures that guide the behavior of states on the issue of nuclear nonproliferation.

Regimes exist in all areas of international affairs, including human rights, security, the environment, trade, finance, and cultural preservation. The study of international regimes has become a central research area in IR. Regime analysis has emerged as a useful approach to understanding conflict and cooperation. Throughout the 1980s and 1990s, scholars in IR (Keohane, 1984; Krasner, 1983; Young, 1989, 1994) produced numerous works that furthered our understanding of and appreciation for international regimes. This literature helps explain how governance without government is possible and why international politics is most often ordered and predictable. Sophisticated theoretical studies of regimes provide a more comprehensive picture of international affairs than the earlier theoretical work conducted during the interwar period. Because regimes include multiple actors (such as states, international governmental organizations, nongovernmental organizations, and transnational corporations), their study provides theorists with a more detailed model of international affairs. In addition, because regimes involve institutional rules (like international law) and socially appropriate practices (like international norms), their study provides an opportunity for a more comprehensive approach to the study of continuity and change in world

politics. (For a more detailed discussion of regimes, see Chapter 51, “International Organizations and Regimes.”)

Alternative Challenges to Mainstream IR Theory

Although the inclusion of factors such as globalizing economic structures and the presence of nuclear weapons offers IR scholars a new set of factors to include in their studies of international affairs, the treatment of these and other issues by mainstream scholars in the field has been viewed as inadequate by scholars critical of a focus on states instead of individuals and national security instead of human security. Alternative voices emerged throughout the 1980s that sought to critique both the mainstream IR scholarship of realists and liberals and the foreign policies that they studied. Although these alternative voices do not represent a single theory or approach to the study of world politics, they share a common concern that the discipline of IR and the practice of international politics have relied on concepts such as *state sovereignty* and the *state system* at the expense of other concepts. This state-centric emphasis marginalizes a set of concerns that need to be explored further if theorists wish to provide compelling and comprehensive answers to current and future problems.

The state, what constitutes it, what the implications are of particular foreign and security policies pursued by it, and where its national interests come from have been left underanalyzed and unquestioned. These questions represent a different type of question than those posed by realist and liberal scholars. Mainstream questions focus on the international environment and leave the internal assumptions of the theories themselves unexamined. Questions that critique the assumptions within theories are termed *critical questions* and require theorists to reexamine and reconstruct the theoretical foundations of international affairs. Often, this means that IR theory needs to be reformulated in order to remain coherent.

This alternative manner of theorizing has had a profound influence on the IR discipline. Feminist, constructivist, and environmental scholars represent important challenges to the traditional study of IR. Each of the approaches is examined below. Note that although each approach is different in its focus and the critical question that it poses, all of the approaches are similar in that they challenge liberal and realist IR theory.

Feminist International Relations

By asking an alternative set of questions, feminist scholars (Carpenter, 2006; Enloe, 1989; Tickner, 1992, 2001) have been able to provide insight into gender issues that remain hidden by standard approaches in the discipline. The general focus of the discipline on war and economic affairs marginalized gender inequality. Feminist scholars in the 1970s argued that traditional gender roles in society undermined inclusion of women in international affairs. Divisions

of labor in both advanced industrial and traditional societies mandated that women remain in the private sphere while men participate in the public sphere. Because war and diplomacy were public acts, women—and the issues of most concern to them—would be discounted. Similarly, because the home was part of the private sphere, feminist concerns of family, education, health care, and children would be marginalized, and issues of state GDP and increased trade would be emphasized. In both cases, feminist IR scholars articulated a new set of questions to challenge mainstream IR scholarship.

Consider the following example. Both realist and liberal IR scholars accept the state as a necessary actor in international affairs and argue that its presence enhances the security of individuals by protecting them (collectively) against potential harm that exists in the international (or external) environment. Realists argue this by employing a concept like the *national interest*, and liberals emphasize this by employing a concept like *collective security* through international law. In either case, both theoretical approaches accept that the state is a central variable in the maintenance of international peace and security. Feminist IR scholarship challenges this assumption and questions whether the state might reinforce social structures that oppress and exploit particular groups. Domestically, IR theories that promote the idea that states protect the national interest and maintain national defenses are participating in a public debate about where to spend limited tax revenues collected by the state. Given a limited amount of state funds that can be spent on all public goods, this has the effect of steering money away from social programs that might be used to educate children, provide welfare and child care assistance, and promote health care for vulnerable groups. If public funds cannot be provided to supply these goods, the burden of supplying these goods often falls on women. Internationally, IR theories that emphasize issues such as balance of power and alliance structures or foreign direct investment and increased global trade are reinforcing a set of social structures that exploit women. In an important early critique of IR, Cynthia Enloe (1989) argues that mainstream IR theory neglected to study the social implications of cold war bases around the world. In *Bananas, Beaches, and Bases*, Enloe directs the attention of the reader away from a standard view of international politics as a struggle for power and security and toward an analysis of the implications of foreign military bases in third-world countries. Recognizing that these bases reinforce stereotypical views of masculinity and perpetuate the exploitation of women who work in and around military bases, Enloe challenges traditional assumptions of international politics. (For a more detailed discussion, see Chapter 41, “Feminist International Relations.”)

Constructivist International Relations

A second alternative challenge to traditional IR scholarship has emerged among scholars interested in challenging the origin of state interests. Constructivists (Hopf, 2002;

Katzenstein, 1996; Lapid & Kratochwil, 1996; Wendt, 1992) focus on the formation of national identity as a prerequisite for understanding and explaining national interests. Issues of identity and the norms that shape and constrain it remain hidden by mainstream approaches to IR that assume a given and predetermined national interest exists among all states. As with the feminists, these scholars ask a set of critical questions that requires a reexamination of traditional theories. The aim of constructivist IR scholarship is to challenge the underlying motivations that both liberal and realist scholars assume states have when conducting their foreign policies. By challenging the essence of these mainstream theories, constructivists are engaged in more than correcting a perceived flaw in IR scholarship; they are also engaged in reimagining the conduct of international affairs and allowing alternative interpretations of historical events to emerge.

Consider the following example. During the cold war, American and Soviet identities were based on a consideration of the other as an enemy. Each state had a negative perception of the other based on the qualities one possessed as distinct from what the other possessed. The United States perceived itself in positive terms because it upheld democratic values and political and civil rights. It perceived the Soviet Union in negative terms because it claimed the Soviet Union did not possess these traits. The Soviet Union perceived itself in positive terms because it was concerned with economic and social equality. It perceived the United States in negative terms because it claimed the United States did not possess these concerns. As a result of these identity constructions, each state determined the other to be an enemy and subsequently viewed the other's actions as hostile and threatening. Constructivists argue that this scenario is what is missing from the work of mainstream IR scholars when they seek an understanding of the national interest. Only by identifying how national identities are created can the interests that form from those identities be understood. The events of the cold war come to be seen as a set of identity performances that reinforce a self–other dynamic in international politics rather than the logical outcome of two states pursuing predetermined national interests. As one prominent constructivist, Alexander Wendt (1992), has stated, anarchy is what states make of it; it is not an enduring cause of war in itself.

Constructivist IR scholarship has become an important voice in understanding terrorism, ethnic conflict, and religious violence. Constructivists have developed detailed case studies exploring how the formations of particular identities among one group exclude membership for other groups. These studies point out that these identities do not cause war but do give rise to a self–other dichotomy that can be exploited by political entrepreneurs seeking power.

Environmental International Relations

A third alternative approach to understanding international relations requires scholars to reexamine the ability

of the state and the state system to solve pressing ecological problems that are transnational in scope and require cooperation among multiple actors. With the rise of national environmental movements in the United States, western Europe, and New Zealand in the 1960s and 1970s, the international community held its first global environmental conference in Stockholm, Sweden, in 1972. The United Nations Conference on the Human Environment was first proposed by Sweden in 1967 and was later supported by the United States. Scientists and policymakers were becoming increasingly concerned that economic activity in one region of the world was affecting the quality of the environment in other regions of the world.

As IR scholars turned their attention to environmental issues, it soon became apparent that the mainstream theoretical emphasis on states, state sovereignty, and the national interest was not an adequate approach to resolving the pressing problems associated with the transnational dimension of the environmental problems. Realism and liberalism were constrained by a state-centric understanding of international politics. The world map that defines both theories is political. The world is divided into states with clearly defined borders. Ecosystems and environmental pollution, however, do not respect state borders. Environmental IR theorists (Haas, 1990; Luterbacher & Sprinz, 2001; Newell, 2006) questioned the disciplinary focus on a political world map and sought to reimagine the map as physical in nature. Political solutions to environmental problems require states, nongovernmental organizations, scientific groups, multinational corporations, and others to cooperate in ways that realists and liberals may not emphasize. Unlike peace agreements after major wars or security alliances during times of peace, solutions to environmental problems usually require the cooperation of more than just state actors. For example, state participation in a security alliance requires the cooperation of key government agencies within a state (the foreign and defense ministries, the chief executive, and a legislative body) but does not require much in terms of changes to the behaviors of the average citizen. Solving transnational environmental pollution, however, might require international governmental organizations, state agencies, corporations, and citizen groups to be involved in changing individual behaviors. Moreover, environmental problems are often linked to economic issues. Solving environmental problems can require states to forego economic development plans and limit short-term economic gains for the sake of improved long-term environmental sustainability.

These challenges to traditional IR scholarship require theorists to construct alternative understandings of international relations. Scholars in this area of IR have researched how environmental scarcity can be a cause of war. Thomas Homer-Dixon (2001) argues that under certain conditions, environmental degradation can contribute to international conflict. Scholars have also examined how the international community has responded to environmental concerns. By examining the institutional structures created since the first

international conference in 1972, scholars such as Oran Young (1989) and Peter Haas (1990) have contributed to the field by including epistemic communities (or groups of scientists with a vision of the problems and potential solutions) and regimes into the study on environmental IR.

In the aftermath of the 1972 conference, the international community has been active in institutionally managing the international environment. The United Nations created the United Nations Environmental Programme and held a subsequent international conference in Rio de Janeiro (the United Nations Conference on the Environment and Development) in 1992. Broad international treaties to manage the oceans (United Nations Convention on the Law of the Sea III), air pollution (Convention on Long-Range Transboundary Air Pollution), the movement of hazardous waste (Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal), and global climate change (United Nations Framework Convention on Climate Change) have been negotiated. (For a detailed discussion, see Chapter 53, "International Environmental Politics.")

Future Directions

The discipline of IR is adapting to new challenges at the dawn of the 21st century. States are confronted with emerging security threats including terrorism, cyber crime, and ethnic conflict. Challenges posed by uneven development, poverty, inequality, and malnutrition undermine possible state-centric responses. Humanitarian crises caused by political violence, corruption, and environmental disasters require substantial cooperation among international actors. A growing awareness of ecological interdependence demands that practitioners, scholars, and ordinary citizens reconceptualize international politics. Many of these new challenges are caused by a process of globalization that has been occurring for centuries. Globalization manifests itself in many ways but is most often referred to as a shortening of time and space that allows human beings to interact more directly than in times past. With rapid changes in communications technologies and information systems, groups once limited by time and space play an increasingly important role in international politics. These nonstate actors challenge IR scholars to incorporate additional variables into more complex theories of world politics.

New Security Threats

Although terrorism is not a new issue in international politics, the globalizing forces that allowed for increased economic trade and wealth also allow terrorists to strike at larger targets. State-sponsored terrorism has been a concern among IR scholars for decades. New forms of terrorism involve nonstate terrorist groups with political grievances against states. Terrorism is generally defined as a premeditated, politically motivated violent act meant to cause fear

among noncombatants. Nonstate terrorist groups challenge states in two ways. First, terrorist groups undermine the political fabric of domestic societies by invoking fear among the populous and undermining the legitimacy of the state to maintain peace and security. Second, terrorist activities challenge the foundation of international society by compromising sovereignty. IR scholars have adapted mainstream IR theories to incorporate terrorist activities. Current analysis seeks to understand the rationality of terrorist organizations and the security responses that states make in order to minimize terrorism.

Cyber crime is another emerging security threat that IR scholars have begun to investigate. A growing amount of national and international commerce and communication takes place electronically. Disruptions to the electronic infrastructure of global commerce threaten national economies and undermine the welfare of societies. In addition, states must protect electronic databases and the classified information they contain. New directions in security studies have been developed to understand and account for the challenges that states face with regard to cyber crime.

Increasingly, conflict between groups involves intrastate ethnic conflict rather than interstate conflict. This represents a theoretical challenge to a discipline founded to transcend or mitigate interstate conflict. As the preceding discussion demonstrates, mainstream IR theories have focused on understanding international wars and promoting effective mechanisms for peace. IR scholars recognize the need to develop a much more sophisticated understanding of conflict that can incorporate both intra- and interstate dimensions of conflict. For instance, recent works by Robert Jackson (1990) and Mohammed Ayoob (1995) explore the internal dimensions of conflict and provide a sophisticated understanding as to how the complex state-making process creates certain states beset by internal conflict and strife. Moreover, these studies demonstrate how these states undermine regional stability. Future research in this area will be necessary in order to develop increasingly useful theoretical models to predict potential areas of conflict and employ international resources prior to their onset.

Development Strategies and Humanitarian Crises

In September 2000, member states of the United Nations adopted a set of millennium development goals to reduce poverty and to increase education, access to health care, and gender equality by 2015. These development goals provide evidence of the continued shift away from the traditional issue areas of international politics. Increasingly, states recognize the need to cooperate on a number of issues that were once considered internal or domestic issues. With the challenges posed by the new security threats and a growing awareness and appreciation for cosmopolitan values, state actors recognize the need to share development strategies and improve the human condition for all. This concern over the welfare of all human

beings and a broad interest in humanitarian responsibility challenges earlier normative concerns in IR. Recent studies in IR involving issues of economic development, poverty, inequality, malnutrition, and humanitarian crises suggest a new normative shift in the norms and values examined by IR scholars. These new values are enshrined in concepts like a *responsibility to protect* those individuals and groups in states who are not being protected by their own states. This departure from traditional understandings of state sovereignty and the principle of nonintervention suggests a new debate about what constitute appropriate sovereignty is currently emerging among practitioners and theorists.

Ecological Challenges

In response to the first global environmental issues in the 1970s, states developed complex institutional mechanisms to manage these problems. The persistence and proliferation of these problems has increased the need to further study cooperative strategies for managing them. Declining biodiversity, a looming energy crisis, and challenges to adequate food supplies are three key areas of environmental concern. However, the most difficult environmental problem to solve appears to be global climate change. Insufficient compliance with the Kyoto Protocol and the development demands of industrializing states such as China, India, Brazil, and Russia require states to resolve long-standing collective action problems in order to construct effective treaties for solving climate change. Collective action problems involve scenarios where the most rational actions taken by individual actors are suboptimal for achieving group success. That is, the best option for the group is not necessarily the best action for each individual member of that group (Olson, 1965). Global climate change is often perceived to be a classic collective action problem. IR scholars interested in this subject are seeking more sophisticated theoretical approaches to resolving climate change by invoking complex and varied incentive strategies to achieve cooperation (Luterbacher & Sprinz, 2001; Newell, 2006).

Conclusion

Although a young discipline, IR has developed increasingly sophisticated approaches to explaining international conflict and the myriad issues that have emerged over the past 100 years. The complexities of world politics and rapid globalization require contemporary IR scholars to investigate more complex issues than those who originally developed the discipline. Although mainstream theoretical approaches to the study of international politics are still important in the field today, alternative theoretical emphasis on gender, norms, and environmental interdependence require scholars to consider a set of important theoretical questions left unexamined by mainstream approaches. Further, new security, humanitarian, and ecological

challenges appear to undermine state-centric approaches in the discipline and require scholars to push the boundaries of the discipline in new directions.

REALISM AND NEOREALISM

SVETLA BEN-ITZHAK

University of Kansas

Realism has long been one of the main theoretical approaches to the study of international relations. It is an intellectual tradition built on distinct concepts and arguments about what governs politics among states. As such, its main precepts assert that the international system is characterized by anarchy, states are its principal actors, which are sovereign and rational acting on national interests, the main ones of which are security and survival. To ensure the latter, states are constantly in the pursuit of power, which ultimately leads to the security dilemma. Leading proponents of the classical realist perspective include Hans Morgenthau, E. H. Carr, Reinhold Niebuhr, John H. Herz, Arnold Wolfers, Charles Beard, and Walter Lippman.

Over the last 20 to 30 years, a new form of realism, known as neorealism or structural realism, emerged in response to internal and external debates that challenged key realist assumptions. In particular, neorealism sought to redefine classical realism into a more positivist social science. To that end, neorealist scholars (such as Kenneth Waltz, Stephen Walt, Robert Gilpin, Randall Schweller, John Mearsheimer, Robert Jervis, Joseph Grieco, and Robert J. Art) reformulated realist rhetoric in favor of a systemic approach to international relations. More specifically, neorealism introduced the concept of international structure in order to construct a systems theory explaining what governs relations among states.

Both realism and neorealism are still among the leading schools of thought governing the study of international relations. In addition, they are often invoked by politicians and academicians alike, not only to explain but also to justify state behavior on the international scene. Thus, given their academic and practical importance, the need to fully comprehend the dynamics of realism and neorealism through past scholarly work, as well as their current standing in academia, warrants and justifies the inclusion of this chapter in this *21st Century Political Science: A Reference Handbook*. To do so, this chapter first reviews in a consecutive fashion the evolution and main precepts of both realism and neorealism. Next, it presents key differences between classical realism and neorealism and outlines main neorealist contributions to the study of international relations. Finally, it summarizes several challenges posed to realism and neorealism by proponents of other schools of thought and discusses the current standing of realism and neorealism in the study of international politics.

Evolution and Main Precepts: Realism

Although realism developed as a distinct theory in international relations only around World War II, key realist concepts can be found in much earlier works. Among those are the *History of the Peloponnesian War*, written by the ancient Greek historian Thucydides, who in the 5th century BCE

attributes the real reason for the war to “the growth of Athenian power and Spartan fear of it” (1:23). One century earlier, the ancient Chinese military strategist Sun Tzu also endorsed the role of realpolitik strategizing in states’ behavior in his classic, *The Art of War*. The essence of Thucydides’ realism was recaptured in the writings of the medieval Italian philosopher Niccolò Machiavelli (2008), who, in *The Prince*, emphasized that a politician (i.e., a prince) above all is to be pragmatic (and not idealistic), seeking and using power when necessary to attain practical ends. Other writings promoting realism included *Leviathan*, by the 17th-century English philosopher Thomas Hobbes (2009), wherein he established the concept of anarchy defined as a state of “war of all against all” (1:xiii). Two centuries later, Otto von Bismarck, a Prussian statesman, used and coined the term “balance of power”—a key realist concept depicting a delicate, balancing act among states trying to keep the peace or the status quo in an anarchic environment.

Thus, increasingly, key realist terms such as *national interest*, *security*, *realpolitik*, and *raison d’état* (introduced by Cardinal de Richelieu during the Thirty Years’ War) as well as *balance of power* entered the lexicon of state foreign relations. World War I, however, brought a blow to realism: Woodrow Wilson, the president of a country whose national historical experience had differed substantially from that of the European states, put forward 14 idealistic points aimed at permanently ending the war and establishing peace based on transparency, diplomacy, and honesty. It is also during this postwar era of optimism and pacifism that the study of international relations was first established as an official academic discipline (in 1919) at the University of Wales. Thus, some argue, the climate surrounding its establishment also bestowed a responsibility on academia (and the branch of international relations in particular) to contribute to ending armed conflicts.

However, World War II ended the idealistic optimism that attempted to curtail, if not to end, realist explanations of state behavior. In the climate that followed this war of unprecedented dimensions, E. H. Carr (1939), a historian and former diplomat, wrote *The Twenty Years’ Crisis, 1919–1939*. In it, he called for a return to realism, which he saw as an antidote to the (liberal) utopianism that marked the beginnings of international relations theory in the interwar period. The return and evolution of realism was further fueled by a European immigrant to the United States: Hans J. Morgenthau (1973), whose 1946 publication of *Politics Among Nations* outlined the premises of classical realism.¹ The latter’s theory is based on six principles that Morgenthau delineates in the first chapter of his book, affirming according to classical realism: (1) Politics are governed by objective laws rooted in human nature, which does not change, and it is therefore possible to derive a rational theory reflecting those objective laws; (2) interest, defined in terms of power, is key to understanding the complex tapestry of international politics, but

power, on the other hand, is defined as “anything that establishes and maintains the control of man over man” (p. 13) and covers social, physical, and psychological means; (3) the key concept of interest, defined in terms of power as an objective category, is universally valid but is not endowed with a fixed meaning; (4) prudence, or the “weighing of the consequences of alternative political actions,” not morals, is the ultimate virtue in politics (p. 14); (5) the moral aspirations of a particular nation are not synonymous with the moral laws that govern the universe, but the concept of interest (defined in terms of power), however, prevents moral excess and political folly; and (6) the political sphere is viewed as autonomous, and the only question of importance probing the political life is that based on interests, asking, “How does this policy affect the power of the nation?” (p. 15). Thus, for the political realist, the only relevant standards of thought are the political ones, leaving out moral, economic, legal, and other considerations.

Based on Morgenthau’s six principles as well as on earlier realist concepts, the key precepts of classical realism assert the following: The international system is anarchic; states are its principal, unitary actors; states are rational actors driven by national interests, the ultimate of which are national security and survival; states pursue those interests by amassing power;² power capabilities determine relations among states; and war is a natural, even necessary, occurrence (Carr, 1964; Herz, 1950; Morgenthau, 1973). Realists foresaw that in the pursuit of security through power and arms accumulation, states may face greater insecurity. This, termed as *the security dilemma*, is attributed by realists to the anarchic international environment that prompts all states to fend for themselves (Herz, 1950). In addition, classical realists perceived international relations as governed by objective laws rooted in human nature yet argued that moral principles apply differently to states (Morgenthau, 1973; Niebuhr, 2001). In fact, the inclusion of morality into international relations is seen by realists as problematic and potentially leading to irrational behavior and conflict escalation.

Evolution and Main Precepts: Neorealism

In the first half of the 20th century, classical realism was affirmed as the dominant strand in the classical tradition of international relations theory (with the second being the liberal, or Grotian, tradition, which stressed the impact of concepts such as domestic and international society as well as interdependence and international institutions) (Holsti, 1985). In the early 1970s, current events led many theorists to question traditional concepts of realism. In particular, the widespread opposition to the Vietnam War and the ensuing détente arguably reduced the importance of nuclear competition (Nye, 1988). In addition, the parallel growth of international trade, the spread of transnational

corporations, a decline in U.S. economic predominance, and the oil crisis of 1973 led President Nixon and Secretary of State Kissinger to speak of a potential five-power world while some scholars foresaw the imminent formation of a multipolar international system (Kahn & Bruce-Briggs, 1972). The oil crisis and the vulnerability of the western states during a period of high commodity prices enabled even weak states to extract important resources from the strong. This led even Hans Morgenthau (1974) to observe that “an unprecedented divorce of military and economic power based on the control of raw material” (p. 56) is taking place. In fact, at this period, many political theorists shared concerns that power has undergone a transformation reflected in Brown’s writings:

The forces now ascendant appear to be leaning toward a global society without a dominant structure of cooperation and conflict—a *polyarchy* in which nation states, subnational groups, and transnational special interests and communities would all be vying for the support and loyalty of individuals, and conflicts would have to be resolved primarily on the basis of ad hoc bargaining in a shifting context of power relationship. (cited in Nye, 1988, p. 236)

Thus, realist arguments were challenged not only by current events (which realism seemed ill-equipped to explain) but also by internal debates as well as external, alternative political theories. The latter included the behavioralist movement of the 1960s; the drive toward a more scientific, positivist approach in late 1970s; and the challenge to integrate theory with specific foreign behaviors in the 1980s and 1990s. More specifically, classical realism was particularly criticized for not being scientifically rigorous enough, which, coupled with the rise of alternative political theories, marked a decline in its evolution in the 1960s and 1970s. However, in 1979, in an effort to steer classical realism into a more scientific, positivist direction, Kenneth N. Waltz (1979), through his book *Theory of International Relations*, gave a new vigor to realism by opening a new page in its development, also known as *neorealism*.

Neorealism, also termed *structural realism*, developed from an internal realist debate seeking to address shortcomings of earlier theories of international relations (including reductionism and systemic theories) by developing a more scientific, positivist approach. In Chapter 3 of his book, Waltz (1979) presents the need for developing a systems theory of international politics. He argues that such a theory will describe how the international system works by focusing on its structure and how it affects the interactions among its main units. As such, a systems theory, Waltz writes, would deal with forces at the international, not the national, level and will have both an explanatory and predictive power. In addition, it will be elegant in its ability to apply general concepts to explain and predict continuity and repetition in international politics. Most of all, however, a system theory of international politics will focus on the system per se and not on the attributes or

the sum of the system’s units. Thus, Waltz goes beyond the classical realists’ representation of international politics in terms of states’ characteristics, rationales, and interactions, focusing instead on one level higher—namely, the international system itself, as a unit of analysis. Later, Waltz points out that “the idea that international politics can be thought of as a system with a precisely defined structure is neorealism’s fundamental departure from traditional realism” (p. 27).

In *Neorealism and Its Critics*, Robert Keohane (1986) asserts that the significance of Waltz’s work is not in establishing a new theory but in the systematization of realism or in providing a “more elegant theoretical basis for realism” (Nye, 1988, p. 241). The key accomplishment of structural realism, therefore, consists in the introduction and definition of international structure, which includes three principles. The first is an ordering principle postulating that the international system tends to be either anarchic or hierarchical in nature. In the neorealist view, anarchy is defined as the lack of a central governing body that can arbitrate between states. If the ordering principle of the system transitions from anarchy to hierarchy, the structure of the system will change as well. The second principle is the function of the units (i.e., states). Neorealism perceives states as having similar functions and therefore does not take into account changing state functions when studying the structure of the system. The third principle is the distribution of capabilities across units. By the term *capabilities*, Waltz (1992) refers to the comprehensive and combined material power of a state, including population, economic development, and military force. Based on the distribution of capabilities, neorealists contend that three possible systems may exist: a unipolar, a bipolar, and a multipolar system containing respectively one, two, or more than two great powers. A consensual neorealist argument is that a bipolar system is more stable and thus less prone to war and systemic change than a multipolar system since there are no additional powers with which to form alliances (see also Jervis, 1998).

Classical Realism Versus Neorealism

Classical realism and neorealism differ in four substantive ways, namely by their changing focus on *structure* as a concept, shifting understanding of causality, different interpretations of power, and dissimilar views of the unit level (Waltz, 1992).

First, the idea that international politics can be conceived as a system having a well-defined structure is the main departure point of neorealism from the classical realism. It is the structure, in fact, composed of interacting units with behavioral regularities, that dictates the behavior of its parts. Neorealism argues that the structure of the international system is defined by an ordering principle and by the distribution of capabilities across units (Waltz, 1979, 1992).

In international politics, neorealists affirm, the ordering principle of the international system's structure is anarchy, defined as the absence of a neutral arbiter and higher authority between states. (Yes, ordered anarchy sounds like an oxymoron, but it is indeed key and logical within neorealist theory.) The distribution of capabilities, on the other hand—seen in terms of unipolar, bipolar, or multipolar power configurations—predicts variations in the balance-of-power behavior of states. Thus, Waltz not only provides a systemic theory to explain and predict the behavior of states (the units) but a parsimonious structural theory at that. However, Waltz's theory—and specifically its parsimony—has been critiqued extensively in Keohane's (1986) *Neorealism and Its Critics* and Rosencrance's (1986) *The Rise of the Trading State* (both works are summarized and assessed by Nye, 1988). Waltz (1986), in fact, offers his counterarguments in defense of neorealism in his "Reflections on *Theory of International Politics: A Response to My Critics*."

One of the criticisms of Waltz's neorealist systems theory is its vaguely defined concept of *international structure*. Keohane (1986) has argued that neorealist theory is too adaptable, for it "can be modified progressively to attain closer correspondence with reality" (p. 191). Barry Buzan (1988), on the other hand, questions whether the structural logic of neorealism captures "the main features of the international political system" (p. 35). He writes, "The criticisms of Ruggie, Keohane, and others suggest that it does not, because their concerns with factors such as dynamic density, information richness, communication facilities, and such like do not obviously fit into Waltz's ostensibly 'systemic' theory" (cited in Waltz, 1992, p. 30).

Waltz (1992) responds to such criticisms by affirming that concepts such as *dynamic density*, *information richness*, and *communication facilities* are not and cannot be elements of a theory, in general, or of his systemic, structural, neorealist theory, in particular. Rather, those are conditions that develop within nations, across nations, or both, that may disrupt and even transform respective societies or cross national relations. Yet such concepts do not and cannot define neorealist theory. In general, Waltz argues, a theory, if it is a good one, would help to understand and explain such concepts' significance and effects within and on the system. However, he affirms, a theory cannot fit the facts or concepts that it seeks to explain. In other words, a theory can be written only by omitting most matters that are of practical interest. To criticize the neorealist systems theory based on its omissions is to misconstrue the essence and purpose of a theory.

Second, classical realism and neorealism differ in their views of causality in international politics—in other words, what causes the observed outcomes in relations among states. For classical realists, the international world is one of interacting states, and causes run in one direction: from interacting states to the outcomes their acts and interactions produce. Neorealists, on the other hand, adopt a

more deductive approach by distinguishing between structural and unit-level causes and effects in order to study interacting states. As such, neorealism contends that international politics can be understood only if the effect of the international structure is added to the classical realism's unit-level analysis. Neorealist theory adopts, therefore, a two-directional causality running from interacting units to produced outcomes, on one hand, and from the structural level to interacting units, on the other. Neorealists contend that the inclusion of both unit-level and structure-level causes allow for neorealist theory to "cope with both the changes and the continuities that occur in a system" (Waltz, 1992, p. 34).

A third dissimilarity between classical realism and neorealism lies in their different interpretations of power. Morgenthau (1973) recognized that scarce resources and the lack of neutral arbiter would lead to a struggle for power among competitors, which speaks of the latter's nature. Classical realists saw states' desire for and the pursuit of power as ultimately rooted in the nature of man. In addition, even when one has accumulated much power, Morgenthau asserts that more is still needed:

Since the desire to attain a maximum of power is universal, all nations must always be afraid that their own miscalculations and the power increases of other nations might add up to inferiority for themselves which they must at all costs try to avoid. (p. 208)

Thus, in seeking to explain state behavior internationally, Morgenthau (1973) conceives it as that of the rational statesman acting with prudence and striving to accumulate more and more power. Power is the ultimate goal and an end in itself. When nations act outside of power considerations, Morgenthau asserts that those actions are not "of a political nature" (p. 27). Thus, the claim that "the desire to attain a maximum of power is universal" (p. 27) is among Morgenthau's objective laws that are ultimately rooted in human nature. Neorealists, on the other hand, rather than seeing power as an end in itself, perceive it as a potentially useful means of which states may have either too little or too much (Mearsheimer, 2001; Waltz, 1979, 1992). Further, neorealists use the concept of power as one of the central characteristics of the system and define it as the combined capabilities of a state.

The fourth main difference between realism and neorealism is their treatment of the unit level. Since realists perceive anarchy to be a general condition (rather than a distinct structure) of the international system, they see interacting units acting in response to their anarchic environment. The different outcomes are attributed to differences within the units, such as dissimilar forms of government, rulers, and types of ideology. Neorealists, on the other hand, affirm that "states are made functionally similar by the constraints of the structure, with the principal differences among them defined according to capabilities" (Waltz, 1992, p. 36). In other words, neorealism

argues that it is structure that mediates the outcomes that states produce and not exclusively the internal state characteristics. Thus, neorealists concentrate on a previously unanswered question in the study of international politics—namely, “How can the structure of an international-political system be distinguished from its interacting parts?” (p. 37). Neorealists perceive states like units, with each state being like all other states in its political autonomy. Thus, while realists concentrate on the heterogeneity of states to explain differences in external behavior, neorealists also add the effects that structure has on state behavior and outcomes.

In summary, although neorealism, pioneered by Waltz, concurs with classical realism that states are the principal actors, it argues that the conditions of the system as a whole influence state behavior and not only state interactions per se. The international system is seen as a structure that causes and defines relations among states. Neorealists reject reductionist theories and, instead, view states as so-called black boxes, thereby dismissing their domestic characteristics as having an exclusive role in states’ foreign behavior (Mearsheimer, 2006; Waltz, 1979). In addition, neorealists, similarly to the classical realists, assert that conflict and war are unavoidable and permanent occurrences in relations among states. However, while classical realists view war as rooted in human nature, neorealists argue that it is the anarchic structure of the international system characterized by the absence of a neutral authoritative body enforcing rules and agreements between states that causes and perpetrates interstate wars.

Beyond Waltz

Thanks to several key contributions, neorealism evolved beyond Waltz’s (1979) pioneering *Theory of International Politics*. In *The Origins of Alliances*, for instance, the neorealist scholar Stephen Walt (1990) introduces the “balance of threat” thesis by expanding on the realist concept of the balance of power. He argues that since states exist in an anarchical self-help system, they tend to balance not against a rising power but rather against a perceived threat. To strengthen his arguments, Walt examines 36 bilateral and multilateral alliance formations and 86 national decisions in the Middle East from 1955 to 1979. Following the examination of these alliances, Walt affirms that his balance of threat thesis gives a better understanding of alliance formation in the Middle East than that provided by variables such as ideology, foreign aid, and political penetration. In addition, he observes that balancing rather than bandwagoning is the aim of alliances formed in the Middle East for the examined period.

Also associated with structural realism is Randall Schweller, who developed the “balance of interests” thesis reviewing Waltz’s balance of power and Walt’s balance of threat concepts. Schweller (1993, 1998) expands his arguments on this subject in two main works—namely,

“Tripolarity and the Second World War” in *International Studies Quarterly*, and *Deadly Imbalances: Tripolarity and Hitler’s Strategy of World Conquest*. In addition, contrary to Waltz, Schweller (1994, 1996) differentiates between states in terms of pursued goals. As such, he classifies them in two categories: (1) status quo and security maximizers or (2) revisionist and power maximizers. Schweller demonstrates that the end goals motivate states as well, and they may align not only to balance (against a loss) but also to gain. However, since he is willing to also consider nonstructural explanations of state behavior (Schweller, 1994; Schweller & Press, 1997), he may more accurately be defined as a neoclassical realist (see subsequent discussion).

In addition to this internal division as to the (exclusive) role played by the international structure on relations among states, neorealists are further divided as to how state security must be ensured. To that end, the two main neorealist branches are offensive and defensive realism: While the former defends aggressive state behavior to protect national security, the latter upholds preventive measures. In addition, John Mearsheimer, a leading proponent of offensive realism, blames security competition among states not on human nature (an argument advanced by the classical realism of Hans Morgenthau) but on the anarchy of the international system. In contrast to his defensive neorealist colleague, Kenneth Waltz, Mearsheimer questions the permanency of the status quo, arguing instead that states are never satisfied with power but ultimately seek hegemony to ensure their security. This argument is clearly expressed in Mearsheimer’s (2001) work *The Tragedy of Great Power Politics*, asserting the following:

Given the difficulty of determining how much power is enough for today and tomorrow, great powers recognize that the best way to ensure their security is to achieve hegemony now, thus eliminating any possibility of a challenge by another great power. Only a misguided state would pass up an opportunity to become hegemon in the system because it thought it already had sufficient power to survive. (p. 35)

Thus, offensive realists argue that, in international politics, aggression is a natural outcome that is generated by rational power maximizers, which are all states. Also, in contrast to Schweller, Mearsheimer stays at the structural level, arguing that it is the structure of the international system that causes states to behave offensively rather than perceived gains or losses (Mearsheimer, 2006).

Challenges to (Neo)Realism

Some have suggested that, in modern international relations, realism has become obsolete (Lebow, 1994; Legro & Moravcsik, 1999; Russett, 1993; Vasquez, 1997). These scholars assert that realism’s concepts of anarchy, self-help, and the balance of power are little, if at all, applicable

to the current state of international environment marked by the spread of democracy, the growth of interdependence, and the influence of international institutions. Waltz, specifically, has been long criticized for not incorporating into his system theory unit-level processes that may generate system-level change (a long-standing criticism in this aspect is that neorealism is poorly equipped to explain system change).

However, realist and neorealist scholars argue that although changes in the system have indeed occurred at the unit level, changes of the system have not (Waltz, 2000). Unit-level, within-system changes, such as changes in technology, transportation, communication, and war fighting, occur all the time, and they do affect how states interact. Nuclear weapons, for instance, have decisively altered how states provide for their security, yet nuclear weapons have not changed the anarchic structure of the international system. And only when changes of the system have taken place can one begin to consider whether realism has run its course. However, if the international system's nature has remained unaltered, realist concepts still apply.

Yet some have raised the question whether realist premises really explain the most important phenomena in international relations. As such, in present-day international relations, key realist assumptions have been challenged through several modern phenomena. First, the argument advanced by (neo)realists that long-lasting peace is unattainable because of the anarchic structure of the international system is challenged by the democratic peace theory. The latter argues that realist predictions do not necessarily apply to democratic states and their relations to other democracies (Owen, 1994). Realists have critiqued this claim by pointing out several of the theory's causal inconsistencies as well as weaknesses of its definitions of *war* and *democracy* that can and must be adjusted in order to demonstrate the key claim that democracies do not fight other democracies (Rosato, 2003; Waltz, 2000). Yet the latter statement has been an observed fact that both realists as well as proponents of other international relations schools have yet to explain.

The constructivist school has also challenged realism and neorealism. Through several influential articles, Alexander Wendt (1987, 1992, 1995, 1999) provided perhaps one of the most ardent constructivist critiques of neorealism. In his articles and subsequent *Social Theory of International Politics*, Wendt challenges the core neorealist premise that anarchy forces states into recurrent security competition. Wendt argues that anarchy and power do not define whether a system is conflictual or peaceful; instead, it is shared culture formed through discursive social practices that define it. Since each state's conception of self (including its interest and identity) is shaped through internal processes, states can reshape the structure through new gestures and reconstituted interests and identities and move toward more other-regarding and peaceful means and ends. Thus, Wendt (1992) argues: "Anarchy is

what states make of it," or in other words, states are not forced by their anarchic environment to endlessly amass power and fall into unavoidable conflicts. Instead, focusing on process rather than structure, Wendt argues that states' identities and interests can be collectively transformed by many factors at the individual, domestic, international, and transnational levels and, as such, are an important dependent variable that state-centered theories need to consider.

Despite Wendt's important insights into realist–neorealist polemic, realists argue that his critique has several flaws. First, it does not address a key neorealist concept—namely, that of uncertainty. For structural realists, states' uncertainty as to the present and future intentions of others is what places the concept of (relative) power as a central causal variable. The main issue, neorealists affirm, as to why systems sometimes fall into conflict is not the differently constructed interests, as Wendt affirms, but the uncertainty about other states' interests and motives that leads to the pursuit of security and, potentially, to conflict (Copeland, 1999–2000; Fearon, 1995). In addition, Wendt does not address incentives that actors may have to deceive one another, which may further exacerbate a situation (Copeland, 2000).

Another challenge to realism is posed by the development of critical theories (including feminist approaches) that question the reasoning behind the formulation of key realist concepts (Tickner, 2005). Further, nowadays, with the advance in both theory and practice of such concepts as complex interdependence, globalization, global justice, transnational, and nonstate entities, realist assumptions accounting solely for the role of states as unitary, sovereign actors are challenged to accommodate new political realities. For instance, the presence of federal states wherein sovereignty is constitutionally split between the national and local governments (with citizens having political obligations to both authorities) challenges realism to account for the role of sovereign subunits that may also participate in the central decision making of a state.

Finally, realism and neorealism are positivist approaches focusing on state security and the pursuit of power above all. Realist insistence to study the impact of material forces (such as the size of military forces, and the balance of powers) through a replication of scientific methods has been increasingly challenged by post-positivist epistemology rejecting the idea that the social world can be studied in an objective, value-free way. Postpositivist theories challenging central realist tenets, such as rational choice, argue that scientific methods are inapplicable to the world of social interactions, making it impossible to build a science of international relations (Bernstein, Lebow, Stein, & Weber, 2000). Those arguments, hitting at the very core of realism—namely, its methodology—have grown in preponderance and in adherents over the last two decades. In particular, studies examining the role of psychological factors in international relations have grown in number and importance over the

last few years. Evaluating these factors has come from the rejection of the realist representation of states as black boxes and the argument that there may be other influences on foreign policy decisions that come from within the state. Some of those internal influences are pointed to come from psychological factors, such as the concept of groupthink, the propensity of policymakers to decide based on (mis)perceptions and analogies, or both (Jervis, 1968; Stein, 2002).

In response to some of the above criticisms, neoclassical realism evolved as the third wave of realism (following neorealism). Neoclassical realism does not reject Waltz's neorealist assumptions but rather refines them in order to offer explanations about specific states' behaviors. In particular, neoclassical realists examine how the distribution of power in the international system, together with states' domestic incentives and perceptions of that system, shape their foreign policy. Thus, neoclassical realists replace the neorealist claim that the possibility of conflict shapes the actions of states with assessment of probability, referring to how likely the worst-case scenario is to occur. Similarly, to the neorealist view that short-term gains matter, neoclassical realists add a consideration of long-term state objectives. Finally, to the neorealists' emphasis of state military preparedness, neoclassical realists add economic gains that may outweigh potential security losses (Brooks, 1997).

Although neoclassical realism has been most useful in theories of foreign policy, Schweller (1994, 2003) argues that it can be used to explain other political outcomes as well. Thus, neoclassical realism has been a positive development of realist theory, for it combines the theoretical rigor of Waltz while allowing for a robust method to test theories on specific case studies of states' foreign behavior. Other prominent neoclassical realists include Fareed Zakaria, Thomas J. Christensen, and William Wohlforth.

Conclusion

Realists today disagree on many internal issues, yet they are united in what they agree on—particularly when faced with alternative international relations theories. Namely, they see international relations as relating to objective conditions; they reject ideological, psychological, and normative considerations to explain relations among states that they perceived as defined by the anarchic environment surrounding states; and they view military capabilities and power accrual as paramount to both states' positioning within the international system and their survival and security.

In 1997, Michael Doyle (1997) expressed what is considered the conventional wisdom that “realism is our dominant theory. Most international relations scholars are either self identified or readily identifiable realists” (p. 41). However, a study conducted by Maliniak, Oakes, Peterson, and Tierney (2007) of the current state of the

international relations discipline (from 1980 to 2006) reveals rather interesting results as to the current standing of realism in the academic community—namely, that “the share of published work that fits squarely in the realist tradition” (p.11) is relatively small. This observation goes against a widespread belief among scholars that realism is the most prominent and popular approach in international relations. In fact, despite the fact that realism is highlighted in academia, Maliniak et al. demonstrate that for the past 27 years, “Realism has never been the most popular paradigm for journal authors, and in 1999 it fell to third behind constructivism” (p. 12). In particular, over the past 10 years, realist arguments seem to have been declining, as observed through published articles in the top 12 journals of the international relations discipline. However, Maliniak et al. demonstrate that even though the number of realist articles has declined, nonrealists continue to consider realist approaches seriously, against which they test their own models of state behavior. Thus, Maliniak et al. argue that “realism still looms large in the minds and research designs of non-realist IR scholars” (p. 12). In sum, directly or indirectly, realism is still much present in current international relations debates, research, and teaching.

Notes

1. Michael C. Williams's edited volume *Realism Reconsidered* (2008) takes a critical look on Morgenthau's scholarship on political realism from a historic, intellectual, and theoretical viewpoint. As such, the chapters written by Chris Brown and William E. Scheuerman discuss Morgenthau's exchanges with the controversial German jurist Carl Schmitt; Anthony F. Lang Jr. examines Aristotle's influence on Morgenthau; Richard Little analyzes the balance of power in “Politics Among Nations”; Michael Cox writes on the purported failure of realism to predict the end of the cold war; and Michael Williams examines the juxtaposition of neoconservatism and realism. Generally, all 10 authors note that Morgenthau's realism has been frequently misrepresented as an amoral, and even immoral, theoretical approach, arguing that his writings are much more nuanced and complex than his critics assert. In fact, the authors argue that Morgenthau's rationales resemble in several aspects some advanced by constructivist international relations theories.

2. Since power is a central tenet in realism, the latter is also known as power politics.

IDEALISM AND LIBERALISM

ERIC A. HEINZE

University of Oklahoma

BRANDY J. JOLLIFF

University of Colorado at Boulder

Most textbooks on international relations (IR) characterize liberalism as one of the main theoretical schools of the IR field—typically alongside realism and perhaps some other less mainstream approaches like international society, Marxism, constructivism, or feminism. As such, liberalism is commonly considered to be the main competing theoretical approach to the dominant IR theory of realism. The frequent comparisons made between realism and liberalism in the IR literature typically entail realism advancing a pessimistic view of human nature, versus the more optimistic view espoused by liberalism. Realists therefore see conflict as the norm in international affairs, while liberals are more hopeful about the prospects for peace and international cooperation. Realists seek to explain international politics by examining state-to-state relations within an anarchical system of mutual distrust and suspicion, while liberals consider other international actors, as well as actors and institutions within the state, as the underlying causes of a more interdependent and law-governed world.

This broad understanding of liberalism represents the approach as it has developed throughout the post–World War II era. Although contemporary liberal theory can be divided into different strands, which this chapter discusses in a following section, the notion of idealism as it pertains

to IR is a slightly different and older idea that played an important role in the evolution of what is now recognized as contemporary liberal IR theory. Idealism—sometimes referred to as utopianism—was a popular approach to analyzing international politics in the period immediately following World War I. It was identified as a theoretical tradition of IR largely in hindsight, with the various attempts by realists at discrediting its central tenets, which were caricatured as utopian or idealistic (see Carr, 2001; Morgenthau, 1993). Although it is true that what is recognized as liberal IR theory has intellectual roots in the idealist tradition of the interwar period, both idealism and contemporary liberalism have their origins in European Enlightenment political thought. This chapter thus traces the intellectual origins of contemporary liberal IR theory to the modern liberal philosophers who theorized about the state. It then describes how liberal theories of the state came to be applied to international politics, subsequently caricatured as idealist, and how the liberal-idealist approaches informed attempts at creating international institutions and organizations. The chapter then discusses how liberal theory enjoyed a revival after the end of the cold war and outlines the different strands of liberal theory that have emerged since World War II. This chapter concludes with a discussion of the main international issues and challenges that confront contemporary liberal IR theory.

The Intellectual Roots of Idealism and Liberalism

Liberalism and Enlightenment Thought

The driving force behind liberalism as a political theory of the state is the centrality of individual liberty. The liberal ideal entails a limited or conditional government, whose legitimacy is derived from the consent of the governed, over whom rulers may not exercise coercion except through means established by law. Liberalism thus espouses a concept of the state whose job it is to remove obstacles to freedom and protect individuals from even majoritarian oppression. To prevent governments from exceeding these limits, of course, requires the familiar array of institutional constraints, checks and balances, and individual rights that underlie the constitutional arrangements of nearly every liberal-democratic polity that exists today.

The English philosopher John Locke (1980) advanced this idea of a limited government using a common state-of-nature argument, whereby all individuals in the state of nature—the prepolitical existence of humans before we lived under the authority of government—had “natural rights” to life, liberty, and property. It is through the human capacity for reason that individuals are aware of such law, though without government to enforce it, transgressors of natural law may be pursued and punished by any person who lives according to the laws of nature, not just by those whose rights were unjustly deprived. The problem, of course, is that such individuals are unlikely to be fair and impartial when punishing transgressors, which is precisely why Locke argued that rational individuals would establish civil government, though one that would preserve and protect the freedoms that individuals had in the state of nature. The idea of a liberal state as it emerges from this Lockean analysis is therefore characterized by political freedom, democracy, constitutionally protected rights, as well as private property.

Many subsequent theorists in the liberal tradition took up Locke’s arguments about the proper structure of commonwealths and began applying them to relations among commonwealths. Modern legal theorists such as Emmerich de Vattel (1863) have been associated with a distinctively Lockean analysis of international relations in that states have no government to rule over them or enforce their rights but are governed by a universal natural law (which Vattel termed the *necessary law of nations*) that is binding on all states and obligates them to respect the rights of one another. Indeed, Vattel uses this general framework as a way to conceive of what we would today refer to as international law and collective security, both of which are widely recognized as liberal prescriptions for international relations.

Immanuel Kant was another important figure in the application of liberal theory to international relations and

is commonly cited as one of the founding fathers of idealism (Hutchings, 1999). Building from the Lockean liberal ideas of individual liberty and popular sovereignty, as well as the Enlightenment credo of human progress and perfectibility, Kant is best known for arguing that states with republican constitutions (i.e., liberal, democratic states) are inherently more peaceful and will thus design international laws to regulate interstate behavior and to promote the conditions for peace. The fundamentally Kantian insight that the domestic politics and institutions of states are critical factors in explaining their international behavior is perhaps the defining feature of liberal IR theory and is the central component of what is widely known as the democratic peace theory (DPT). Kant also argues for the creation of an international federation of democratic, peaceful states that will expand its membership over time and make the world more peaceful. Kant is not calling for a world government, but rather a sort of loose union of states that maintains itself, prevents war, and steadily increases its membership (Kant, 1991).

Locke’s conception of private property was likewise an important starting point for much theorizing on the ideas that free and open societies should have an open marketplace. This is not only because market capitalism was thought to best promote overall welfare by efficiently allocating scarce resources within society, but also because of the supposed pacifying effects that this has internationally. According to liberal thinkers such as Jeremy Bentham, John Stuart Mill, and Adam Smith, free and open trade among nations has a general harmonizing effect since it is mutually beneficial and contributes to the happiness of one another’s society (see Howard, 1978). The basic idea was twofold. First, since many wars were fought by states as a means to enrich themselves yet these wars still proved to be costly and did not benefit the society as a whole, free trade would be a more peaceful and efficient means of achieving wealth, which is a common interest of all states. As a corollary, the free movement of commodities, capital, and labor across borders would break down divisions between states. This would open up lines of communication between them to reduce uncertainty, binding countries together using the common tie of economic interest (Ricardo, 1911). Thus, what Michael Doyle (1997) refers to as “commercial pacifism” is simply the idea that market societies are fundamentally against wars.

What emerges from this discussion of international liberalism as it evolved from Lockean liberalism throughout the Enlightenment is a set of ideas about international relations that include (a) a strong preference for a law-governed society of states, (b) cooperation in international organizations to collectively enforce this law, (c) the spread of democracy and liberal values (therefore bringing about peace), and (d) the pursuit of free trade to enhance global prosperity and help bring about peace. Thus, by the late 19th and early 20th centuries, liberal Enlightenment thought had produced the broad contours of what would

become known as idealism and set the stage for the emergence of IR as an academic discipline.

Idealism and the Twenty Years' Crisis

The calamity of World War I and the horrific human toll it brought about led to new efforts to try and understand, prevent, and ultimately eliminate war. As a result, the academic discipline of IR was born. For liberal thinkers of the time, the war was largely a result of the egoistic and reckless miscalculations of autocratic rulers in heavily militarized countries, as well as the outdated system of alliances based on a balance of power that had dominated Europe for centuries (see Jackson & Sorensen, 2007). Since liberal thinkers had some clear ideas and strong beliefs on how to avoid such disastrous wars in the future, the emerging discipline of IR was highly influenced by these liberal principles and was guided by a desire to replace the malfunctioning European balance of power with a system of international law and collective security, as well as to reform the structure of autocratic governments in order to make them more peaceful.

Prominent among this group of liberal intellectuals was British writer Norman Angell (1913), whose book *The Great Illusion* argued that war was no longer a profitable and useful tool for the conduct of state foreign policy. Angell argued that wars of conquest between industrialized states had become futile and that the best solution to aggression was “third party judgment” within a collective system (Miller, 1995). For Angell, states’ single-minded pursuit of their own security in a condition of anarchy (i.e., the absence of a world government) led to war; thus, security needed to be provided internationally. After the Great War, he became an ardent supporter of the League of Nations, suggesting that “the military power of the world should be so pooled by international agreement for supporting a common rule of life for the nations as in fact to make it the police power of civilization” (cited in Miller, 1995, p. 112).

Yet it is perhaps the architect of the League of Nations—U.S. President Woodrow Wilson—who is most commonly associated with interwar idealism. President Wilson entered the United States into World War I on a decidedly liberal platform: to make the world safe for democracy. Wilson was highly critical of the European balance-of-power system and saw it as his mission to bring liberal democratic values to the rest of the world. Wilson’s Fourteen Points contained his vision for the new liberal foundation of international politics, which emphasized, *inter alia*, the promotion of democracy and self-determination based on the conviction that democracies do not go to war against each other. Another important principle contained in Wilson’s vision was the creation of an international organization based on a set of common rules in international law that would replace the unstable balance-of-power system that he argued had failed to prevent the war.

The League of Nations was therefore created to promote peaceful cooperation among states based on the idea that there should be reason-based substitutes for war. Although the realists were content to allow the dangerous game of power politics to occur unrestrained based on an unstable balance of power, Wilson’s view was that the warlike impulses of states, statesmen, and other instruments of conflict could be controlled by an intelligently designed international institution. This notion of Wilsonian idealism was thus based on the liberal view that when rational human beings apply reason to international problems, they can establish institutions that can improve the human condition (Jackson & Sorensen, 2007).

Highly influenced by Wilsonian idealism, IR scholarship during the interwar period consisted mainly of forward-looking liberal conceptions of world federations, blueprints for a more perfect League of Nations, and the development of new international institutions and legal codes for interstate behavior, all amid a strong normative desire for the avoidance of great-power war (Wilson, 1995). Yet as we know, the League of Nations was doomed to failure, and the ideas being championed by the likes of Angell and Wilson came under intense criticism. The League was helpless against the onslaught of the Great Depression and the protectionist policies that ensued, as well as the expansionist policies of Germany, Japan, and Italy. Perhaps the best known critique of the interwar idealists is that of E. H. Carr’s *Twenty Years’ Crisis* (2001), which is most famous for its attempt to debunk the pretensions of the liberal thinking that dominated the international relations discourse during the twenty years’ crisis, between 1919 and 1939. Carr argued that liberal thinkers had fundamentally misread history and therefore misunderstood the nature of international relations (Knutsen, 1997). Although the idealists believed that international relations could be based on a harmony of interests among different states, Carr argued that this was wishful thinking (hence utopian) and that we should assume that there are conflicts of interests among states. In short, Carr accused the liberals of being too preoccupied with what international relations ought to resemble rather than what it actually resembled and for overemphasizing the role of international law and morality and underestimated the role of power (Carr, 2001; Wilson, 1995). This framework, which posed a dialectic between utopia and reality, would be highly influential in the development by later realists of a more scientific, fact-based way of studying IR that emerged in the 1950s with the behavioral revolution in the social sciences (Waltz, 1979). With the spread of autocratic and militaristic states and the failure of the League to prevent the outbreak of World War II, the liberal assumptions underlying Wilsonian idealism fell out of favor among IR scholars, and the field soon became dominated by realist thinking, with its pessimistic view of human nature and emphasis on international relations as a conflictual struggle for power within an anarchical system. Yet liberal thinking

remained an influential part of IR theory and would soon reemerge as an important source of scholarship as it was refined in light of the realist challenge to its foundational principles.

Contemporary Liberal IR Theory

Liberalism in the Postwar Era

The bipolar structure of the cold war period put considerable stress on liberal theory's ability to explain international politics, since realism arguably offered more explanatory power in the context of an anarchical system dominated by two powerful hegemonies mired in a security dilemma (see Waltz, 1979). Yet as international actors emerged from World War II and were forced to confront pressing issues about the future international political and economic order, liberal principles continued to play a prominent role. The postwar order was fundamentally organized as a rule-based international order, wherein international cooperation was encouraged as a means to ensure peace, economic prosperity, and human rights. Such was the rhetoric of the founding treaties of many postwar international organizations (IOs), such as the United Nations (UN), European Community (EC), and the Bretton Woods institutions. Although not solving the world's problems, the interstate cooperation that these organizations encouraged gave liberal IR scholars renewed optimism about the role international institutions could and should play in world politics and provided a whole new set of organizations, institutions, regimes, processes, and interactions that became the subject of investigation by liberalist IR scholars.

Despite the emergence of several new international organizations during the postwar era, the international security environment was dominated by cold war power politics. Yet at least in the West, the Bretton Woods institutions and the UN offered glimmers of hope to those still attempting international cooperation in a threatening, hard, power-dominated bipolar system. These key institutions were created to govern monetary relations among the world's states, to encourage free trade among them, and ultimately to facilitate the spread of free market economics.

As IR scholars began considering the power realities of the postwar period—particularly the hostility between the United States and the Soviet Union—the idealism that dominated interwar thinking gave way to realism, particularly among U.S. academics, which was further fueled by the rise of behavioralism in political science. The rise of behavioralism in the social sciences was essentially a call for more rigorous methodologies that applied stricter, more scientific reasoning in IR scholarship that was to be less normative and ideologically driven and more interested in observable facts, measurable data, and the finding

of “law-like” behavioral patterns (Knutsen, 1997). Although the supposedly more objective and dispassionate realism was perhaps a better fit to such a method for social-science scholarship, new formulations of both realism and liberalism emerged in an attempt to answer the call of the behavioralists for more methodological rigor.

Inspired by the scientific ambitions of behavioralism, Kenneth Waltz (1979) developed a new form of realism—dubbed *neorealism*—that focused on the structure of the international system comprised of unitary states, wherein he attempted to achieve lawlike statements about international politics that could achieve scientific validity. For Waltz, the anarchical structure of the system leads rational states to be power seeking and inherently distrustful of other states, thus leading to the fundamentally conflictual character of international politics. Liberal theorists, such as Robert Keohane and Joseph Nye, took a slightly different approach in their attempts to answer the behavioralist challenge. This work was largely based on the early functionalist research of those scholars studying European integration in the 1950s, who studied how cooperation in one issue area can “spillover” to allow for cooperation in other areas (Deutsch, 1957; Haas, 1958; Mitrany, 1966). This new brand of liberalism—or neoliberalism—sought to explain the various instances of cooperation among democratic states by reference to the idea of *complex interdependence*, which includes the various forms of connection between states in addition to the political relations of their governments, such as transnational links between businesses (Keohane & Nye, 1971, 1977). This leads to an absence of hierarchy among issues—that is, a condition where military security is not necessarily states' top priority. Thus, in contrast to the neorealist vision of international politics, the neoliberals argued that there are other important actors in international relations that contribute to interdependence among states, which leads to less conflict among them.

In such an interdependent world, openings developed for international institutions and IOs to become influential actors that facilitate cooperation through information exchanges and the provision of arenas for resolving disputes. This became the basis for another wave of neoliberal IR scholarship that focused on the role that international organizations and regimes played in state behavior (Krasner, 1983). It was Robert Keohane's (1984) *After Hegemony* that was perhaps the most influential publication on these general themes. Seeking to address the neorealist critique of neoliberalism head-on, Keohane adopts many of the foundational assumptions of neorealism. Whereas the neorealists argue that this rationality leads to conflict, Keohane demonstrates that it can lead to cooperation and the establishment of institutions. Building on hegemonic stability theory, Keohane seeks to explain why such cooperation persists even after the decline of the hegemon's power relative to other states. While admitting that hegemonic leadership can be helpful in creating a stable

order wherein cooperation flourishes, he develops his functional theory of regimes to explain why such cooperation persists “after hegemony.” According to Keohane, even rational, egoistic states will have an incentive to participate in regimes because they help states overcome obstacles to achieving optimal outcomes. In this sense, international institutions promote cooperation between states because they help alleviate the problems associated with international anarchy: distrust and uncertainty between states and the transaction costs associated with interstate cooperation. In short, regimes are developed because actors in world politics believe that they help them make mutually beneficial agreements that would otherwise be difficult or impossible to attain (Keohane, 1984).

The Liberal Revival After the Cold War

The disintegration of the Soviet Union and the end of the cold war brought dramatic changes to domestic and international political structures and provided both challenges and opportunities for the various strands of both realism and liberalism. In a confident reassertion of the optimism and progressive outlook of liberalism, Francis Fukuyama’s (1989) essay, “The End of History?” proclaimed the ideological victory of liberalism over all other alternative theories of politics. For Fukuyama, the end of the cold war and the various democratic transitions in Africa, east Asia, Latin America, and eastern Europe represented the triumph of liberal capitalism and that there could be no improvement on its underlying principles and institutions, at least in theory. Fukuyama helped to revive the long-held view that the spread of liberal-democratic principles is the best prospect for a peaceful world order, spurring a vigorous scholarly debate on exactly how democracy, market economics, or both lead to peace, as well as the extent to which democracy needs to be consolidated within states in order for them to behave more peacefully.

Another related development in liberal thought in the post-cold war era was the proliferation of human rights norms, treaties and agencies, as well as a vigorous debate over what is known as *humanitarian intervention*. Although the principal human rights treaties predate the end of the cold war, the victory of the pro-Western forces in this ideological struggle made room for both state and nonstate actors to work more toward realizing human rights throughout the world. Although it is no coincidence that dominant international norms to a large extent reflect the values of the most powerful members of the international community, even though human rights are an essentially Western liberal idea, this idea has proven to be broadly appealing throughout the world—even in non-Western societies such as Japan and South Korea. Thus, the debate over human rights in international politics is not whether they exist or should be acknowledged, but rather when and how to implement them and how to

enforce these protections when states violate human rights (Forsythe, 2006).

A final development in liberal thought that gained prominence in the post-cold war era has been the rapid globalization of the world economy. Economic neoliberalism—a term generally used to refer to global market capitalism and free trade policies—has always favored the free play of market forces and the minimal role of the state in economic life. Yet liberal IR scholars view these developments in the context of the state and the international states system and focus on developments such as the growth of free trade, the increased ability of multinational corporations to escape states’ legal jurisdiction, the supposedly increasing irrelevance of state boundaries to the conduct of economic activity, and how these developments affect states’ behavior internationally (Friedman, 2000; Held, 1999). The idea of free trade and the belief in its efficiency and pacifying effects have nevertheless been the governing ideologies of the various free-trade institutions such as the WTO, EC, NAFTA, the IMF, and World Bank that have proliferated in the past two decades.

The Main Strands of Contemporary Liberal Theory

Liberal IR theory is a long and varied theoretical tradition that draws on some common foundational principles, insights, and ideas that in some way, shape, or form originated with European Enlightenment thought. But how can one make sense of or try to organize these different approaches? Although different books offer different categorizations, schools, or strands of liberal theory, there is some, but not universal, agreement on how to categorize the different approaches. This chapter offers four main categories, or strands, of contemporary liberal theory: pluralism, interdependence liberalism, institutional liberalism, and DPT.

The first strand of liberal thought is categorized here as pluralism, also known as *sociological liberalism* or sometimes *global governance theory*. Pluralism draws on the discipline of sociology to enhance state-centered approaches to IR by understanding relations between sub-state actors, or transnational relations—that is, individuals, groups, and organizations within states alongside traditional focuses on relations among political elites (Rosenau, 1980). According to Karl Deutsch (1957), increasing instances of transnational relations over time, and the increasing intensity of these interactions, can result in the creation of “security communities,” wherein potential and actual points of conflict between states can be addressed effectively, thereby promoting cooperation and peace. Thus, for pluralist theorists, transnational relations have the ability to not only facilitate cooperation by the presence of security communities, but can also foster the development of norms and rules promoting stability and peace in relations among states (Rosenau, 1990).

In short, for pluralists, IR is more than the study of relations among states and includes relations among private individuals, societies, and other groups. The more these non-state actors interact, network, and become interdependent, the less inclined their governments will be to resort to conflict.

Interdependence liberalism comprises the second grouping of liberal theory. Attempting to develop the earlier functionalist theory of David Mitrany (1966), Ernst Haas's (1958) groundbreaking neofunctionalist theory explained European integration in terms of political elites within Europe, identifying shared goals and interests and undertaking targeted cooperation on specific (economic) policy areas. Once integration of policy began, processes of cooperation and integration became self-reinforcing through the effects of spillover, whereby cooperation on a single policy necessarily leads to further cooperation on other policy areas in order to ensure policy effectiveness. Similarly, dealing with cooperation through institutions, Keohane and Nye's (1977) institutionalism bred the theory of complex interdependence, discussed previously. Complex interdependence details an international system where economic and social issues have become at least equal in importance to security concerns of and among states. Transnational relations therefore serve to transform a world based on political transactions occurring primarily between political elites to a world system where relations between influential citizens and nongovernmental organizations can wield significant influence on state actions as well. As such, international politics were transformed to appear to function in a manner similar to domestic political relations within states, thereby creating what has been termed *complex interdependence*.

More recent scholarship in this area can be found in the work of Anne-Marie Slaughter (2004) and focuses on what are known as *intergovernmental networks*. By looking within states at their different constituent institutions—that is, by disaggregating the state—Slaughter observes a complex web of networks between the various agencies of different states, such as law enforcement, environmental, financial, and a whole host of government agencies that are increasingly exchanging information and coordinating activity to address common problems on a global scale. Reminiscent of John Burton's (1972) "cobweb model" of transnational relations among private groups, Slaughter's networks are composed of government actors, which, unlike private actors, are more capable of being held accountable.

Institutional liberalism represents the third variant of liberalism and includes such approaches as regime theory and neoliberal institutionalism, which like interdependence liberalism, began with the observation that levels of international cooperation were much higher than could be explained by neorealists. The initial work that applied this institutional approach was that of regime theory, which focused not only on formal IOs but also on the broader

concept of *international regimes*, defined as sets of principles, norms, rules, and decision-making procedures in a given issue area (Krasner, 1983). This included not only IOs but also informal and nonbinding arrangements. Focusing on the prospects of both formal and informal international institutions for facilitating international cooperation, institutional liberalism argues that institutions are not merely weak tools of the state, but rather can provide vital channels through which cooperation can take place if states perceive the benefits of cooperation to outweigh the potential risks (Keohane, 1989). International institutions, organizations, and regimes help states overcome a range of collective-action barriers to cooperation by increasing opportunities and methods for information sharing, providing arenas for open discussion and negotiation between political elites and state actors and fostering a culture of cooperation. This not only makes cooperation easier by helping overcome collective action problems but also provides assurance and shared expectations that make defection from agreements more costly over time for all involved (Keohane, 1989; Keohane, Nye, & Hoffman, 1993).

The work of Robert Keohane discussed previously was seminal in the development of this approach in that it attempted to respond directly to the neorealists by accepting the neorealist assumptions that states are the dominant actors in international politics and that they are rational actors—that is, that they calculate the costs and benefits of certain actions and take the action that gives them the highest payoff. This led some to accuse the neoliberals of essentially being neorealists in disguise, except with a focus on international (economic) institutions. Yet there are some subtle, yet important, distinctions. According to David Baldwin (1993), neorealists and neoliberals first disagree on the nature and consequences of anarchy, with neorealists seeing anarchy as placing more severe constraints on states than neoliberals. As a corollary, neorealists view international cooperation as both more difficult to achieve and maintain and more dependent on state power, and neorealists are therefore more skeptical regarding the ability of institutions to mitigate anarchy. Second, neorealists assume that states are more concerned about relative gains, whereas neoliberals have emphasized absolute gains. In other words, when states are faced with the possibility of cooperating for mutual gain, neorealists argue that states will be concerned how much they will gain vis-à-vis other states, whereas neoliberals believe states are concerned primarily with their own gains and are largely indifferent to the gains of other states. Third, neorealists and neoliberals differ on the priority of state goals in that the former emphasize security and survival, and the latter, following the interdependence liberals, argue that states are more concerned with economic welfare. Finally, the two schools differ on threat perception. Whereas neorealists assume that a state's capabilities or power is decisive in how the state will behave, neoliberals argue that it

is not just the capabilities of a state that matter, but also the state's intentions. Thus, neoliberals emphasize intentions, interests, and information as explanatory variables, whereas neorealists emphasize the distribution of capabilities (Baldwin, 1993).

The last strand of liberal theory this chapter discusses is DPT, also commonly referred to as *republican liberalism*, which has been given considerable prominence among liberal theories in the contemporary study of IR. Essentially, democratic peace theorists, including the early writings of Kant, observed that democratic states do not go to war with one another. Reasons given for the peaceful relations existing among democratic states include the argument that since democratic governments are answerable to their citizens, the risk of electoral ramifications for leaders undertaking war with another democratic state is fairly high; the observation that democratic societies tend to value peaceful resolution of conflict; and finally, the empirical observation in the tradition of the previous three strands of liberal theory that democratic states tend to be highly interdependent on one another through membership in international organizations, institutions, and regimes (Doyle, 1997; Gilpin, 1981; Lipson, 2003; Russett & O'Neal, 2001). Furthermore, the dramatic increase in the number of democratic and democratizing states from the 1970s to the 1990s, in what has been termed the *third wave* of democratic development, provided increased salience to DPT and has contributed to the prominence of this approach in the study of IR (Huntington, 1991).

Conclusion: Applications and Challenges

With the end of the cold war, the continuing globalization of the world economy, and the atrocities caused by global terrorism, the traditional issues that occupied the liberal research agenda have been endowed with a new sense of urgency. Issues of trade and global economics remain central to research agendas of institutional and interdependence liberals, particularly the study of international organizations, both new and old. Since the collapse of the world economy in late 2008, there has been an urgent need for more knowledge on how IOs such as the WTO, the Bretton Woods institutions, and the various free-trade organizations such as the EU and NAFTA have either contributed, or may be used as a solution, to the current financial crisis. Likewise, research on international networks of banking and other international financial institutions requires further development as the processes of integration and transnational relations continue to intensify in places like western Europe.

Furthermore, especially since the 2003 Iraq War, there has been a renewed debate over the democratic peace and calls for more research on exactly how democracy leads to peace and whether or under what conditions it may be permissible to forcibly change the government of a state to

make it more democratic and peaceful. The role of IOs in the area of international security is also a pressing concern, as NATO evolves from its cold war posture into a tool for democratic enlargement and an entity better equipped to deal with terrorist and insurgent challenges in places like Afghanistan. Newer institutions such as the African Union are likewise increasingly becoming the subject of analyses regarding how this entity, in conjunction with the United Nations, can become more effective at addressing the numerous crises on the African continent, such as in Darfur, Sudan, and the Democratic Republic of Congo. Likewise, the potential emergence of nuclear threats from Iran and North Korea has made collective efforts at nuclear nonproliferation a particularly important subject as states attempt to use the international nonproliferation regime to prevent the spread of weapons of mass destruction. Such questions that deal with the emergence, change, and effects of IOs therefore remain crucial to the institutional and interdependence liberal research agendas.

Finally, the attention given by governments to nonstate terrorism and the resources dedicated to combating it demonstrate an urgent need for more research by pluralist liberals regarding the threats of nonstate armed groups, including global terror networks like al Qaeda, as well as more regional groups such as Hezbollah. What is the best way for states to cooperate to combat this threat? What is the relationship between liberal democracy and terrorism? The current wave of Islamic militancy is profoundly antiliberal and therefore presents a threat not only to liberal states but also arguably to the global order over which liberal states have presided. Although some have argued that the emergence of al Qaeda and its affiliates is evidence of the deterritorialization of international politics and the further decline of the sovereign state, others argue that it has allowed the state to accumulate more power, including placing new restrictions on civil liberties, enhancing powers of surveillance and detention, and increasing military spending (Harvey, 2003). As Scott Burchill (2005) notes, the threat posed by Islamic terror has been met by an increase in military activity by powerful states that have been emboldened to intervene—even preventively—in other states' internal affairs.

Liberalism as portrayed in this chapter is an inherently optimistic approach to understanding international relations that emphasizes the role of international institutions, free trade, domestic (liberal) political institutions, and non-state actors as all having important influence on international politics. Virtually all liberal scholarship is imbued with a faith that there can be progress in human affairs. Although liberalism may have originated as a broad philosophical statement about human progress and perfectibility, it is today best understood as an analytical project concerned with exploring the possibilities for international peace and cooperation and for improving the human condition (Sterling-Folker, 2006). Although there has been reason to be optimistic about the outlook for international

political life over the past decades—particularly since the end of the cold war—recent years have witnessed profound changes that continue to challenge this optimistic outlook. The task for liberal IR scholars today is to improve our knowledge of these various changes in order to gain a better understanding of their causes and consequences in the hopes that they can be better understood and ultimately overcome.

DEPENDENCY AND WORLD-SYSTEMS

GLORIA C. WALKER

Centenary College of Louisiana

The economic and political instability faced by former colonies and other developing countries in the post–World War II era sparked a great amount of concern and much debate within policy circles and scholarly research. Within political science, the resultant research became known as *political development* and encompassed the fields of comparative politics, international relations, and international political economy. One of the main concerns of this literature is the unequal and inequitable economic and political development that exists between developing and developed countries. In response, two main schools of thought emerged, modernization and dependency (of which world-systems is a part), each taking a very different approach to explaining the origins and effects of this observed lack of development. Before describing dependency theory, however, it is first necessary to put this work in context by describing modernization theory, which emerged first and to which dependency was a direct response. Since modernization theory is discussed in detail elsewhere in this handbook, only a brief introduction is provided below.

The primary assumption of modernization theory is that there is one path to development, which consists of adopting the modern values, behaviors, technology, and institutions of developed countries. The focus of the modernization approach is thus to apply the so-called Western (western Europe and the United States) development experience to the rest of the world. For development to occur, a country

must replace traditional norms and structures such as rural society, rigid social structures, passive citizen participation, undifferentiated political structures, traditional and elitist sources of authority, subsistence agriculture, and primary economic activity with modern structures and values including geographic mobility, urbanization, flexible social structures, active citizen participation, complex political structures, merit-based authority structures, formalized judicial system, rule of law, and economic diversification. The success with which this diffusion of modern values and institutions occurs determines the eventual political and economic development achieved. Once traditional values and institutions are replaced with modern versions, there is no turning back since such changes cannot be undone.

Modernization theory thus describes a linear and irreversible process that creates conditions conducive to economic growth and political development. It is also an internally driven process that gives no consideration to external or international influences that may adversely affect a country's ability to develop effective political and economic structures. If a country fails to adopt modern ways, modernization theory concludes this is due to inferior or so-called wrong values. Since culture and values are viewed as deeply rooted and difficult to change, a country with the wrong values is unlikely to benefit from any guidance and assistance provided by developed countries, and thus their policymakers may conclude that aid and investment will not contribute

to modernization and redirect their money to countries with the so-called right values.

The assumption that both a single linear path to development and the failure to develop are due solely to internal factors was viewed by many scholars, especially those from developing countries, as being an incomplete, value laden, and offensive approach to development. In response, scholars, economists, and policymakers from Latin America, known as *dependentistas*, took exception to modernization theory's Eurocentric approach and internal focus and developed dependency theory, an externally oriented argument, to explain the lack of political and economic development in developing countries.

Theory

Dependency and world-systems theory are often presented as unified approaches to development since both are primarily concerned with the ways in which external factors, particularly the international capitalist economic system, have affected and continue to affect developing countries. They did, however, emerge separately, with the former originally focusing on the political economy of Latin American underdevelopment and the latter building on dependency by placing it within a larger global historical context. Dependency-based work began to appear shortly after World War II but reached its peak in the late 1960s and 1970s when modernization had established itself as the dominant approach to development and as increasing concern arose in academic and policy circles regarding the fate of former colonies. World-systems emerged in the 1970s as a historical-sociological approach seeking to place dependency in historical perspective by focusing on what are termed *long cycles* in history and the effects of the most recent cycle on developing countries.

Both approaches are also often identified with Marxism since they argue that imperialism, exploitation, and the international capitalist economic system are to blame for underdevelopment. Imperialism and exploitation are key concepts for dependency and world-systems, but instead of applying them internally to a domestic class-based system as with Marxism, they are applied externally to the international economic system, which emulates a class system at a global level. Another parallel is the argument that to escape exploitation, revolution must occur. In Marxism, the proletariat must overthrow the bourgeoisie, whereas in dependency the countries of the periphery (developing countries) must revolt against economic domination by the core (developed countries); however, the timing of revolution is a key point of disagreement. Marx and Engels (2002) argued in *The Communist Manifesto* in 1848 that all countries go through linear stages of development, with socialism being the last and highest level thereof. Most dependentistas, however, find Marxism's linearity

unacceptable and argue that rather than incurring long-term suffering while waiting for the right point in the process at which to have their revolutions, developing countries need to bypass the stages and take immediate action to improve their situations.

The first writings in what would become dependency theory were from neo-Marxist Latin American economists and sociologists seeking to explain why, despite more than 100 years of independence, Latin America continued to lag far behind western Europe and the United States in terms of economic development. An early and influential work was produced in 1950 by Raul Prébisch while he was working for the United Nations Economic Commission for Latin America (ECLA). It was in this groundbreaking work that the concepts of core (or center) and periphery were introduced along with the assertion that the core exploits the periphery. The arguments developed in this work sparked what would become a vibrant and lively debate between modernization theorists and dependentistas.

Dependency

In response to modernization's claim that to stimulate economic growth, developing countries simply need to duplicate the path of the developed countries, dependency argues this is impossible since that path no longer exists. The international capitalist economic system did not exist when the West began the development process; instead, the system is a product of the West's development that was created to facilitate its continued economic growth. Developed countries were in fact able only to grow their economies, industrialize, and accumulate significant wealth through the political and economic exploitation of other countries by way of colonialism and imperialism. Although colonialism has ended, it remains in developed countries' best interests to maintain this system given the advantages it provides, and as a result, they actively prevent developing countries from growing competitive economic systems to ensure their continued exploitation. As a result, the rules of the development game are very different for developing countries since they are faced with a coherent and exploitative international economy that is structured to keep them at a disadvantage.

Dependency theory thus argues that rather than being cultural, development is in fact structural and dependent on the nature of a country's insertion into the international capitalist economic system. For developed countries, this insertion was voluntary and purposeful since they created the system for their own benefit. For former colonies, however, insertion was originally involuntary via colonialism, and on gaining independence, the new states were weak and uncompetitive. The prospects for development are thus influenced by the long-term political and economic effects of the state's insertion into this system.

Early Dependency Theory

Dependence is most clearly defined in Theotonio Dos Santos's (1970) article "The Structure of Dependence":

By dependence we mean a situation in which the economy of certain countries is conditioned by the development and expansion of another economy to which the former is subjected. The relation of interdependence between two or more economies, and between these and world trade, assumes the form of dependence when some countries (the dominant ones) can expand and can be self sustaining, while other countries (the dependent ones) can do this only as a reflection of that expansion, which can have either a positive or a negative effect on their immediate development. (p. 231)

Dependence thus involves an asymmetrical power relationship between the core and the periphery, in which the latter has little or no ability to grow and expand because of its continued exploitation by the core. This asymmetrical relationship can ultimately be traced to colonialism since it is the structures put in place during this era that continue to limit development opportunities in the periphery today.

Under traditional colonialism, conquest and subjugation created conditions for the monopolization and exploitation of a colony's natural resources (including labor). This, in turn, facilitated the rapid development of core economies by allowing them to cheaply fuel industrialization, develop economic diversification, and effectively compete and trade with each other. The effect on the colony was to make it a provider of cheap raw materials and agricultural products to be exported to the colonial power. As a result, the colony's survival was dependent, in the truest sense of the word, on the colonial power. Although colonialism via political domination officially ended with decolonization, dependency asserts that the core still economically dominates and exploits the periphery, a condition referred to by dependentistas as *neocolonialism*. Despite the name, neocolonialism applies to all countries in the periphery, not just former colonies, since the structure of the international capitalist economic system creates the same disadvantages for all developing countries.

Under neocolonialism, the economic situation for the periphery remains relatively unchanged as the ability of the newly independent countries to expand and diversify their economies is limited by the core's continued control of the global economic structures put in place during the colonial era. The periphery remains limited primarily to the production and export of agricultural goods and raw materials and thus finds itself having to import finished goods, technology, and other industrial goods from the core. The wealth generated in the international system continues to flow primarily to the core since, as the financier of the production process, it receives the profit from the finished product as well as any taxes from its sale. The periphery, on the other hand, receives an artificially low

agreed-on price for its raw materials and agricultural products (because of the core's superior negotiating power) with very little, if any, money reinvested in its economies and production processes. Given the relatively high value of the goods the periphery imports from the core, the relatively low value of the goods it exports to the core, its minimal industrial capacity, and its low ability to diversify, the periphery receives a disproportionately small share of gains from trade, has generally unfavorable terms of trade, and builds increasing trade deficits.

Another issue related to colonial legacy and neocolonialism is the need for countries in the periphery to secure foreign investment and borrow capital from the core in an attempt to overcome their structural disadvantage and compete effectively in the international economy. Foreign investment brings desperately needed capital and industry to the periphery but ultimately extracts more than it adds as profits are returned to and reinvested in the core, not in the periphery. The ability to borrow money as a means of raising investment capital is generally considered to be beneficial to developing countries, but dependentistas argue that international financial institutions such as the International Monetary Fund and the World Bank create a perpetual cycle of debt through high interest rates and predatory lending practices. The core, for all practical purposes, thus directs the most profitable sectors of the dependent country's economy as well as state economic policy and is, as a result, able to keep the periphery dependent on it for infusions of capital. The negative effects of foreign direct investment and debt are considerable for developing countries and leave them at a severe competitive disadvantage and in a perpetual state of underdevelopment. Rather than being a means for escaping poverty and improving economic performance, foreign capital in reality structurally limits growth potential, with the capitalist system serving as another imperialist tool to maintain control of the periphery and to ensure that the periphery remains dependent on the core.

Although the process just described is economic in nature, the economic control the core wields gives it strong de facto political control over the periphery. This continued political dependence arises from the incentive structure created under neocolonialism and the need for the periphery's political, economic, and military elite to maintain dependent economic relationships for fear the periphery will lose power if it defies the existing structures and agreements. Members of the periphery elite thus find themselves supporting a system that closely resembles the exploitative colonial structure in which only a powerful few benefitted, except now the benefits also accrue to them. The incentive structure is ultimately not conducive to providing collective gains for the entire population but rather selective gains for the elite. As a result, although the core may no longer have the direct political control present under colonialism, it still has significant indirect control leading to continued political dependence.

The prospects for economic growth and political development in dependent countries are thus grim. Since developing countries are relegated to an exploitative system in which production is limited to raw materials and unfinished goods, ruled by elites with a vested interest in maintaining the status quo, and dominated by a core with a vested interest in ensuring it stays that way, development is unlikely. Thus, dependentistas argue, if countries in the periphery cannot develop while participating in the international capitalist economic system, they must withdraw from it. In essence, if the rules of the game are biased against you, then you have two choices: to continue to play by the rules and thus continue to be exploited or to rewrite the rules in a way that does not leave you at an unfair disadvantage. Absent significant changes, the periphery is essentially doomed to continued economic and political dependence. The solution is to remove the periphery from the exploitative capitalist system by creating a competing economic order either with or without full-scale socialist revolution.

Dependent Development

In the late 1960s and early 1970s, some Latin American countries (Argentina, Brazil, Colombia, and Mexico in particular) began to experience economic development through diversification and industrialization that was largely fueled by increased investment from multinational corporations (MNCs). This naturally called into question some of the assumptions of dependency theory—particularly the role of foreign investment—and its pessimistic conclusions regarding the prospects for development. Fernando Henrique Cardoso and Enzo Faletto argued in 1969 (the publication date in the original Spanish) that the nature of dependency had changed for these countries because they possessed more resources and had higher industrial capacity than other dependent countries and as a result were able to gain more leverage against and reduce the constraints imposed on them by the core. They were no longer fully dependent, but were instead in a state of “dependent development,” an economic status in which there is growth and some measure of increased economic control, but ultimately, the core maintains significant influence over policy and development (Cardoso & Faletto, 1979).

Dependent development is the result of the internationalization of a dependent country’s internal market via MNCs. Given the profit imperative of corporations, many have sought to cut costs and increase profits by shifting some of their production capacity to developing countries where the cost of land, labor, and raw materials is lower than in the corporation’s home state. The MNC thus negotiates with the political, economic, and perhaps even military elite in the host country (the dependent state) to allow it to open a factory, mine for minerals or metals, or refine a raw material. In exchange, the host country benefits from taxation and fees (usually negotiated at a reduced rate) from

the MNC’s activity, diversification of the economy, lower unemployment, and in some cases, improved infrastructure in the form of roads, ports, railroads, or airports that results from the MNC’s need for better access to transportation.

On the surface, MNC investment appears to be beneficial to the host country, but there are other factors to consider that, according to dependent development, may lead to economic decline, political instability, or both. MNCs invest in periphery countries only when it helps to maximize their profits, and thus although the internationalization of a host country’s economy results in increased development, this development is ultimately only a side effect of an MNC’s investment. All profits, aside from those needed to maintain the offshore facility, are invariably invested back into the MNC, thus profiting the home country through tax revenues it receives from the MNC’s domestic and international activities. In addition, all decisions regarding MNC activity are made at corporate headquarters, and thus, key economic decisions that could adversely affect the host country are made without its input and out of its control. Should the MNC’s profits decline or disappear, it has no incentive to remain in the host country and is thus likely to withdraw and seek a better deal in another developing country. The results of MNC withdrawal are potentially devastating since without the MNC driving development, the economic situation is likely to deteriorate, leaving many local workers unemployed and eliminating the economic benefits the host country was receiving.

Dependent development also has implications for political stability within the host country because of the uneven distribution of wealth and increased income inequality that arises from economic growth. The elite benefit greatly from their arrangements with the core, while the masses receive little to no relief from extreme poverty. This in turn has the potential to lead to civil unrest and domestic conflict as the masses challenge the status quo, demanding improved living conditions and reduced income inequality. These circumstances put the elite in an untenable position as they must choose between continued development and domestic turmoil, with the latter potentially leading to open rebellion or even revolution. The most likely outcome in this situation is for the state to implement coercive measures against the masses to ensure the development agenda is not compromised. The MNC–elite alliance thus often serves to develop and maintain repressive governments (Evans, 1979).

Although under the conditions of dependent development countries are able to develop beyond those experiencing full dependence, the process is still neocolonial in nature. Profitable economic sectors remain under the control of the core, except rather than the core state having direct control, MNCs, acting as their agents, now fulfill this role. The host state, on the other hand, experiences growth through foreign investment, but this growth is ultimately dependent on maintenance of the exploitative

relationship, leaving the developing country vulnerable to changing economic conditions in the core. In the end, the relationship remains heavily skewed in favor of the core and structured in a way that keeps the periphery at a competitive disadvantage.

World-Systems

World-systems theory was inspired by dependency's arguments and is most closely identified with Immanuel Wallerstein (1974). Although world-systems has its origins in historical inquiry, theorists argue that the approach in fact transcends traditional disciplinary boundaries since it considers the world as a whole, not just from a political, economic, sociological, or historical standpoint. As a result, world-systems theorists distinguish between systems of the world, as represented by the focus on discrete units such as states, and systems that are a world, represented by a system that is larger than any single national or political unit. A world-system does not necessarily encompass the entire world, but it does integrate multiple political and cultural units whose behavior and interactions are guided by a set of systemic rules and cultural norms known as a *geoculture*. There are two types of world-systems: world-empires and world-economies. In world-empires, there is a single political authority for the entire system and a common culture that often dominates peripheral areas. In world-economies, on the other hand, although there is no single political authority, there is a dominant economic structure that guides state interactions and creates an integrated system of production that results in a division of labor based on industrial capacity.

The modern world-system, which is a world-economy, originated in the so-called long 16th century in western Europe, which began with the Spanish discovery of the Americas in 1492 and ended with the Peace of Westphalia in 1648. During this period, the core of economic power shifted from the old Mediterranean to northwest Europe. As part of this shift, the old core (the Mediterranean) became the semi-periphery (a new category of developing country described subsequently). The rest of the world that was economically relevant at the time, Latin America and eastern Europe, then became the periphery. The French Revolution of 1789 was another crucial point for the current world-system since it solidified liberalism as the dominant philosophy of the core and thus implemented a new *geoculture*. With liberalism came the concept of universalism, an important principle stressing equality in citizen access to the system and in the application of laws. Wallerstein (1974) notes that although these values are generally common to core countries, they are not necessarily applied and encouraged elsewhere, leading to inequality within the system. The completion of the modern world-system occurred in the late 19th century when the rest of the world, previously external to the system, became economically integrated into the world-economy via colonization and industrialization's need for more and

cheaper resources. In focusing on long cycles of economic and political development, world-systems broke with the dominant perspective that the modern world order was a product of World War II and its aftermath and argued instead that it was in fact 500 years in the making.

The modern world-system added a new category of state, the semi-periphery, to the relationship between the core and the rest of the world. The semi-periphery consists of countries that possess both core- and periphery-style production capacities. The core-type industries produce higher cost, higher value manufactured goods and behave no differently than producers in core countries in that they exploit countries in the periphery. The periphery-type industries, on the other hand, produce lower cost, lower value goods, such as raw materials and agricultural products, and are exploited by core countries. Countries in the semi-periphery thus have a mix of production capacities that creates two very different economic sectors within a single country and as a result makes it vulnerable to domestic conflict: Those tied to core-type industry seek to maintain what they have at all costs, and those tied to periphery-type industry seek to improve their situations. This is essentially the same relationship one sees between core and periphery countries, except at work within a single country. The relative mix of core- and periphery-type industries determines the degree to which a state is ultimately still dependent on the core and whether it escapes the periphery to join the semi-periphery. However, despite the fact that countries in the semi-periphery are in a better situation than those in the periphery, they remain far less developed than countries in the core and because of the structural constraints of the world-economy will not be able to escape semi-periphery status.

The way in which the state and political power are treated analytically differs between world-systems and dependency. Dependency is a state-oriented approach in terms of the primary level of analysis, yet it tends to ignore state power as an important factor in explaining variation in development levels across countries and relies instead almost exclusively on the international capitalist economy to explain the differences. The world-systems approach, on the other hand, argues that the appropriate level of analysis is the world-system since the study of discrete units such as states, their national histories, and national political structures is analytically limiting given the global nature of state activity. However, world-systems theory recognizes that states are capable of exercising considerable political power and thus contribute to explaining variation in development levels. In fact, state power plays a key role in world-systems since international political history is replete with examples of one state after another upsetting the system in an attempt to gain more power and, ideally, control of the world-system itself. State power is thus considered a key component in explaining the historical emergence of the core and its ability to subjugate and exploit the periphery. State power, or rather lack thereof, also helps to explain the inability of the periphery to

develop since these states are either in a colonial situation in which they completely lack autonomy or in a neocolonial situation in which autonomy is low and external influence and control are high.

The effect of this world-system has thus been to create a world-economy with a reach never before seen. It is based on capitalist economic principles with its primary priority being the accumulation of capital for its own sake. To achieve this priority, the system is characterized by a worldwide division of labor in which economic structure (core, periphery, semi-periphery) is determined by a country's or region's specific mix of economic activity and each zone being rewarded differently by the world economy, with the core rewarded with the highest levels of surplus and income. The modern world-system is thus ultimately an unequal system in which the core, because of its superior wealth and state power, is able to exploit the periphery and semi-periphery to ensure its own continued enrichment and development.

Wallerstein (2004) later updated his argument to include what he refers to as the current crisis of the modern world-system. This crisis began with the cultural shocks of 1968, which were characterized by widespread social upheaval in the core, periphery, and semi-periphery as a result of increasing disillusionment with the promises of capitalism and democracy's apparent inability to adequately and appropriately foster economic development, political stability, and social equality. In terms of world-systems theory, many in the periphery and semi-periphery no longer believed investment by the core was the answer to development but instead simply a means of maintaining the core's power, and thus, large numbers of the exploited and their sympathizers no longer believed that if they were patient, the system would reward them (as it did the core).

These changing beliefs about the nature of the world-system have thus led to increasing questioning of and agitation against the existing system and form the basis of a large-scale rejection of the dominant liberal geoculture that has been emergent since the French Revolution. The result, which jeopardizes the capitalist world-economy, is a destabilization of the world-system, which Wallerstein (2004) argues is reflected in increased institutional instability and political violence throughout the periphery as well as reduced cooperation with international financial institutions such as the World Bank and the International Monetary Fund. The effects of 1968 are thus still felt today and, according to Wallerstein, are likely to continue to be felt for another 25 to 50 years while the existing world-system either stabilizes or a new system emerges.

Critical Evaluation and Empirical Evidence

Early work in dependency was primarily theoretical and anecdotal, and given the highly controversial nature of the theory, it has been subjected to strenuous critical evaluation

and empirical testing. Critical evaluation has occurred on both theoretical and methodological grounds and points out a number of key weaknesses of dependency. Empirical analysis has been undertaken by both proponents and critics seeking to empirically test dependency's assumptions and implications and has yielded mixed results. Ultimately, although there is some support for dependency, there is not clear and consistent evidence that satisfies its critics.

Critical Evaluation

Dependency theory has a number of recurring criticisms. First, the theory is accused of being both too broad and too narrow. It is too broad because it seeks to be a universal explanation in attempting to explain all cases of a phenomenon while using a single set of assumptions and variables. In the case of developing countries, underdevelopment can be explained for all of them with the same cause and process—namely, exploitation via position in the global economic order. Dependency theory is also accused of having too narrow a focus given the argument that the capitalist international economic system (a single external factor) is the cause of dependence and underdevelopment without taking into consideration important internal factors such as the role of class, culture, state strength, or ethnic heterogeneity. Some dependentistas went so far, for example, as denying tribal relations and conflicts in precolonial Africa a role in the postcolonial political and economic situation even after old ethnic tensions erupted into violence. In treating local history and actors as irrelevant to a country's development, dependency theory ignores potentially contradictory evidence, thus leading to research results that may be skewed toward supporting the theory despite the existence of information that could in fact dispute it (Smith, 1979).

Another critique is that the concept itself is vague, ill-defined, and potentially tautological because the definition generally includes the very concepts that need to be defined, specifically, exploitation and underdevelopment. Furthermore, dependence is not appropriately operationalized, meaning the definition leads to measuring it in a way that limits its analytical power. Dependence is typically treated as a dichotomy with a country categorized either as dependent or not dependent, rather than as a continuum in which there are various degrees of dependency. Just as there are great disparities between developed countries, there are also great disparities between dependent countries. As a result, the effects of dependency are likely to vary depending on the relative dependence of each individual state. Given this, critics ask whether the same set of policies or solutions is appropriate for all developing countries or whether there is a need to differentiate policy by degree of dependence. In treating all dependent countries the same way, dependency theorists potentially compromise any inferences and conclusions they may draw from their analyses.

The final main critique is that given the primarily anecdotal and historical evidence used by dependentistas, especially in early writings, the evidence is often thin in that it focuses on establishing historical processes without applying empirical tests of actual conditions within countries that would support the theory. Baran (1957), for example, argues that were it not for British exploitation, India would have had a much smoother and much less traumatic development process, yet how can one know this? How does one test for what might have been? Arguments based on conjecture are ultimately untestable since one cannot gather nonexistent empirical evidence. This was in fact a common pitfall of much early dependency literature and became a major issue resulting in a flurry of empirical tests, a summary of which is provided in the next section.

Empirical Evidence

Empirical analyses of dependency theory have been conducted by both proponents and critics, with the former attempting to develop solid evidence supporting dependency's assumptions and implications and the latter seeking to determine whether there is reliable support for the theory's universalist arguments. Tests of dependency apply a variety of methodological approaches including single case studies, regional studies, cross-regional comparisons that incorporate cases from two or more regions, historical analysis, and statistical analysis. A key issue with empirical analyses of dependency is the difficulty in forming testable hypotheses given the historical and anecdotal approach discussed earlier. Another problem is that, depending on the part of the theory being tested or the country or region being examined, different variables and measures are used, which can make it difficult to compare results across studies and develop a coherent and consistent body of evidence. Ultimately, despite the various approaches used to test dependency, empirical testing of the theory has yielded mixed results, with some studies claiming a relationship between dependency and underdevelopment (Bradshaw, 1985; Chase-Dunn, 1975) and others failing to find sufficient evidence to support the theory's contentions (Jackman, 1982; McGowan & Smith, 1978).

In empirically comparing developing countries, a number of exceptions, particularly the rapid and sustained economic growth and relatively equitable income distributions of the so-called Asian Tigers (South Korea, Taiwan, Hong Kong, and Singapore) from the 1960s to the mid-1990s, call into question dependency theory's claims regarding the inability of periphery or semi-periphery countries to experience significant economic growth and development. These countries in fact achieved sustained growth through close ties with the core, consisting of a combination of trade, loans, foreign investment, and technology transfers, all of which are factors dependency theory argues will inhibit growth and deepen dependence. Despite the 1997

economic crisis that appeared temporarily to validate this argument (since the area was heavily dependent on foreign investment), the region has experienced a solid recovery, which would again tend to dispute the conclusions and implications of the dependency approach. The shifting of European Mediterranean countries from core to semi-periphery and back to core again also appears to defy the predictions of dependency theory. All of these countries have apparently found a way to escape dependent status, something dependency theory argues is extremely unlikely. Critics of this approach point to such cases as evidence of its limited explanatory power and argue the reason for this is the failure of dependency theory to take internal factors into consideration.

Overall, the evidence tends to show that those developing countries experiencing the highest economic growth rates, rising per-capita income, and reduced income inequality (the Asian Tigers, for example) have very close ties to the international economic system and to the core. In general, countries with higher levels of foreign investment and lower trade barriers (tariffs, regulations, etc.) experience high levels of growth at a rapid rate. Those applying significant trade barriers and with lower levels of foreign investment, on the other hand, tend to be furthest removed from the core and among the poorest of the developing countries. These relationships run counter to dependency's predictions. However, as dependency theory predicts, countries that rely primarily on the export of raw materials and agriculture do tend to be very poor and not perform well in terms of economic and social development indicators.

Policy Implications

Dependency and world-systems theory sought to shift the focus of policymakers away from the assumptions and implications of modernization theory and toward those of dependency, particularly the issues of exploitation by the core, predatory lending practices by international financial institutions, and the negative effects of relying on foreign aid and investment.

A popular approach for developing countries seeking to improve their conditions and escape dependence was to implement import substitution industrialization (ISI) policies. These policies have three main characteristics: promotion of domestic production of industrial goods that substitute for imported goods, an overvalued currency that allows the emerging manufacturers to import the heavy equipment and other machinery needed for production, and protectionist barriers to trade such as tariffs on imports intended to protect the developing country's infant industries from foreign import competition. As a result, these policies are intended to replace foreign control of the economy with domestic production and thus result in the discouragement of foreign direct investment, particularly by

MNCs. The logic is that in substituting domestically produced versions of products for imports from the core, the country becomes more self-sufficient and thus reduces dependence. As a result, the policy partially implements dependency's recommendation that dependent countries must distance themselves, if not remove themselves outright, from the international economic system.

One result of this policy was increasing budget and trade deficits. Budget deficits emerged as government spending increased to develop the infant industries and build infrastructure to support them without having the necessary tax revenue to pay for it. Trade deficits emerged because of the overvaluation of currency, which resulted in lower exports as the developing country's products became increasingly uncompetitive on the global market. These policies were sustainable for quite some time because of continued investment and aid from developed countries, but once money became scarce, as happened with the 1973 Organization of Arab Petroleum Exporting Countries oil embargo in response to U.S. support of Israel during the Yom Kippur War and the subsequent 1979 reduction in oil supply due to the Iranian Revolution, investment and aid tended to become scarce as well. At this point, countries practicing ISI, some for 20 or 30 years, were faced with an increased need to borrow money; however, when interest rates rose, repayment became more difficult, further adversely affecting their economies. When Mexico declared that it could not meet its debt repayment obligations in 1982, lending virtually stopped and developing countries found themselves having to reconsider their ISI policies (Geddes, 2002).

Given the long-term effects of ISI policies and the results of the empirical research described previously, developing countries have had to reconsider their position on foreign investment, aid, and trade. Since the initiation of the Doha Round of World Trade Organization (WTO) talks in 2001, developing countries have increasingly attempted to renegotiate the terms of trade and demand concessions and exceptions to various provisions of the WTO they feel are discriminatory or that maintain their structural disadvantage. We also see developing countries working together, acting in loose blocs, both within the WTO and in negotiations with the European Union, to increase their leverage.

Future Directions

Although dependency and world-systems theory have significant flaws and have not been consistently verified by empirical research and observable development patterns, the underlying concepts and arguments are still appealing to many in the (semi-) periphery and the core. As dependency theory has evolved, theorists have had to accept the limitations of the theory as originally formulated and have instead begun to focus on more specific issue areas. Examples of

more narrowly focused research that is likely to prove fruitful for future research include investigation into the effects of globalization on dependence (see, for example, the special issue of *Studies in Comparative International Development* edited by Heller, Rueschemeyer, & Snyder, 2009), how dependence affects gender issues within the periphery (Scott, 1995), and dependence and political violence (Boswell & Dixon, 1990).

Another potential direction for the dependency approach has its roots in the failure of both dependency and modernization theory to be consistently supported when subjected to rigorous empirical testing. Neither is able to explain development (or its failure) on its own, yet both appear to be at least partially relevant. As a result, there has been a call by some theorists to reconcile and combine the two theories in an attempt to create a true universal theory of development. However, since the two are opposites, or mirror images of each other, there is concern that attempts to reconcile them would create an overly general theory that lacks useful and relevant explanatory power. Nevertheless, attempts to combine them could provide useful insight into the theories, with the potential to spark interesting new approaches to dependency.

Conclusion

Dependency and world-systems theory emerged in the 1950s and 1970s to refute the predominant approach to political and economic development (modernization theory) and provide an alternative explanation as to why developing countries fare so poorly. Their approach was to focus primarily on a singular external influence, the international capitalist economic system, and how a country's insertion into this system affects its ability to generate economic growth and development. Countries that enter the system as a result of decolonization or other forms of economic exploitation, or that entered well after the system's creation, are at a distinct disadvantage since the system is designed to benefit the developed industrialized economies of the core and to maintain their economic supremacy. Dependency theory, as a result, argues that although direct exploitation via colonialism has ended, dependence on the core is maintained via the economic control created by neocolonialism. Although dependent development modified dependency to argue that developing countries are no longer consigned to being helpless victims of exploitation by the core, they are still heavily impacted by it, and although some countries may be able to significantly improve their conditions and foster economic growth and development, it will not be enough to reach parity with the core. For those countries unable to attract foreign investment and loans to facilitate industrialization, the prospects remain grim.

This continuing focus on predominantly external factors continues to be a major weakness of dependency theory

since it virtually ignores internal factors such as social problems, ethnic conflict, and ineffective political institutions. Dependency theorists critiqued modernization theory for focusing exclusively on internal factors influencing development yet ultimately made the same assumption themselves by focusing exclusively on external influences—and in so doing left the dependency approach vulnerable to the criticism of being as biased and incomplete as modernization theory. Given the variety of experiences that have shaped developing countries, it is problematic to argue that regardless of colonial status, region, or domestic history, all are influenced in the exact same way by a limited set of influences. Because of these criticisms and the failure to establish clear and consistent evidence for the theory's assumptions and implications through empirical testing, mainstream dependency theory has moderated the breadth of its claims with recent scholarship, focusing instead on more specific issue areas rather than continuing to develop a universal theory with only limited support.

FOREIGN POLICY ANALYSIS

BARIS KESGIN

University of Kansas

The scholarly study of foreign policy in the field of international relations (IR) goes back to the mid-1950s and early 1960s. Although this means that foreign policy analysis (FPA) is still a relatively young area of specialization, the FPA literature is rich and diverse. As it is discussed in the following pages, since its inception FPA has evolved through distinct stages (Hudson, 2005; Neack, Hey, & Haney, 1995). Specifically, FPA has moved away from searching for an overarching theory of foreign policy to finding theories that work under certain conditions. In this chapter, FPA refers to the scholarly study of foreign policy as a whole, which includes such distinct literatures as comparative foreign policy and foreign policy decision making.

This chapter proceeds as follows: First, foreign policy is described, and then the FPA subfield is situated within the broader field of IR. This is followed by a review of major approaches within this subfield from foundational works to the most contemporary research. At the end, the policy relevance of the work produced by the FPA scholars and future directions of the subfield are discussed. The chapter concludes with a list of suggested readings.

Introduction

What is foreign policy, and how is it different from the study of IR more generally? By *foreign policy* we mean

the actions, strategies, and decisions directed at actors outside the borders of a domestic political system (i.e., a state). That the primary intended target of policy is external to the domestic sphere distinguishes foreign from domestic policy (Kaarbo, Lantis, & Beasley, 2002). In other words, as Breuning (2007) puts it, foreign policy is “the totality of a country’s policies toward and interactions with the environment beyond its borders” (p. 5). A state’s foreign policy covers a variety of issues ranging from the rather traditional security and economic areas to environmental and energy issues, foreign aid, migration, and human rights (Breuning, 2007). The actors that initiate foreign policy actions, and those who are the targets of the actions, are often states—but not always.

According to Breuning (2007), FPA is “first and foremost interested in explaining how and why . . . decisions came about” (p. 164). In effect, this means that—distinct from the broader study of IR—FPA places an emphasis on the human beings involved in the decision-making processes (Breuning, 2007; Hudson, 2005, 2007). As such, FPA looks beyond the state as a single entity and includes the study of multiple actors within a state, both as individuals and as groups of individuals in their capacity to make or influence foreign policy. In other words, this inquiry goes further than governments and investigates the influence of individual leaders, bureaucracies, and institutions in foreign policy making.

FPA is an eclectic subfield of IR and benefits from many other disciplines such as psychology. One of the most important features of FPA is that it is pursued in a comparative perspective. Comparison entails searching for potentially generalizable patterns in foreign policy making across time, space, and issues. As such, this inquiry can involve comparing foreign policy choices of different leaders within the same country, or foreign policy decisions of different countries regarding the same or similar issues. To the degree that such work would empirically confirm theoretical propositions, a generalizable theory is reached—often with certain set of conditions attached to it (called a *midlevel* theory). As major works in this research are reviewed in the following sections, this chapter outlines the evolution of FPA as a subfield of IR research.

Theory

There is no single, distinct theory of foreign policy; instead, theories of foreign policy derive either from IR theories such as realism and liberalism or from various approaches to explaining domestic sources of foreign policy making within a state—for instance, leaders, bureaucracies, and culture. This difference in emphasis, respectively, corresponds to looking at external and systemic factors and societal and domestic sources in foreign policy. The latter make up the bulk of the literature in FPA. In contrast to the study of IR more generally, where there is the motivation to formulate grandiose, comprehensive theories, FPA is occupied with building midlevel theories. This chapter first briefly reviews IR theories that are relevant to explanations of and prescriptions for foreign policy; then, major approaches to domestic sources of foreign policy are discussed.

Theories of International Relations

IR theories explain how states relate with each other in world politics. A logical conclusion of this focus is explanations of foreign policy behavior in many IR theories (Kaarbo et al., 2002). Indeed, as Smith (1987) argues, “Virtually every attempt to explain international relations involves an explanation of foreign policy” (p. 348). Many, if not all, IR theories concentrate on the impact of the international system on foreign policy. Although all the theories discussed in this section here are discussed in greater depth elsewhere in this volume, a short review will help to place foreign policy within the context of the field of IR.¹

Realism

Realist theories of international relations are defined by their assumptions of anarchy and self-help, and a unified, rational actor understanding of the state. Accordingly, realists claim that in order to survive, states should act as power

maximizers. For realists, a state’s foreign policy is very much conditioned by its position within the international system and the distribution of power therein.

Liberalism

Although certain variants of liberalism share some assumptions of realism, liberals differ from realists in that, for them, the international system by nature is more conducive to cooperation. According to liberal theories of IR, it is in the self-interest of states to cooperate with each other. International institutions play a crucial role in facilitating cooperation among states, since they help states overcome distrust via their established rules. In contrast to realism, liberalism recognizes that domestically states are home to diverse interests and actors. As such, liberal theories of international relations also look into domestic politics since they explain state behavior. For instance, the role of interest groups or businesses in foreign policy is included in the analysis. Liberalism’s most important conclusion for foreign policy is that with a shared culture of liberalism and its ramifications on domestic institutions, like-minded liberal states would have peaceful relations with each other—the democratic peace argument.

Constructivism

Constructivism can best be considered as an approach to IR than as a theory. Constructivist approaches ushered in a major turning point in the study of IR and hence have significant repercussions for the study of foreign policy. Broadly speaking, constructivism defends that intersubjectively created social norms and values explain the behavior of actors in the international system. As such, constructivists question the very existence of such concepts as anarchy and argue that these concepts reflect our own understandings of international relations.

Other Theories of International Relations

Today, variants of realism, liberalism, and constructivism are major IR theories. Alternatives include but are not limited to feminist and Marxist approaches to IR. Similar to the dominant theories discussed previously, the alternatives are not foreign policy theories either, but again we can infer from feminism and Marxism as we study foreign policy.

Feminist approaches to international relations focus on issues pertaining to gender relations and question how these affect the way international relations is studied and practiced. Such an approach often entails how the exclusion of women from politics (or the society or both) and dominant, contrasting notions of masculinity affect world politics.

A Marxist understanding of IR emphasizes the importance of class relations in world politics. By extension, foreign policy read through the lens of Marxism would

explain foreign policy decisions in terms of economic interests and conflicts within and between states.

Approaches to Foreign Policy Analysis

The emergence of FPA as a distinct area of study dates back to the seminal Snyder, Bruck, and Sapin (2002, originally published in 1954) and two other works that followed (discussed in the next section). Since then, the field has significantly expanded, unpacking the domestic determinants of state behavior. Today, many scholars distinguish two phases in the development of the literature on FPA. The first stage includes the foundational works in the field; the second follows with a proliferation of research in psychological analysis of individuals and groups as foreign policy decision makers. This chapter follows the same approach in its discussion of the FPA literature.

Foundational Texts

FPA within the IR field goes back to three “paradigmatic works” written in the 1950s and 1960s (Hudson, 2005, 2007): *Decision Making as an Approach to the Study of International Politics* by Richard Snyder, H. W. Bruck, and Burton Sapin (2002); *The Ecological Perspective on Human Affairs With Special Reference to International Politics* by Harold Sprout and Margaret Sprout (1965); and “Pre-Theories and Theories of Foreign Policy” by James Rosenau (1966).

In reaction to the dominant realist approach to IR, in 1954, Snyder, Bruck, and Sapin (2002) call for looking beyond the state and specifically to actors involved in foreign policy decision making. Likewise, Sprout and Sprout (1965) suggest that the psycho-milieu of the individuals and groups involved in foreign policy making need to be understood in order to explain foreign policy behavior. Finally, Rosenau’s (1966) pretheories article, on the other hand, is a call for systematic, scientific, cross-national generalizations of state behavior. It was from this particular quest that the comparative foreign policy (CFP) approach was born, which sought to create a grand theory of foreign policy (one that would explain all foreign policy across time and space in empirical terms).

The significance of these works was that they championed the idea that individual decision makers and their characteristics were at the heart of understanding foreign policy (Hudson, 2007). Likewise, their message called for an understanding of foreign policy beyond a mere output but also as a process. Hence, the study of FPA has expanded much beyond and benefited from many other disciplines as it grew as a field of research.

Contemporary Approaches to Foreign Policy Analysis

Contemporary research and interest in FPA has not progressed in a linear fashion. First of all, one observes a

break with the Rosenau (1966) line of research that was engaged with producing a grand theory of foreign policy. By the early 1970s, such attempts at creating large data sets as the Comparative Research on the Events of Nations (CREON) and the Dimensionality of Nations (DON) were being overshadowed by an emerging literature focusing instead on explaining the impact of individual and group behavior on foreign policy. The CFP approach that derived from Rosenau and dominated the field during the 1970s gradually disappeared in the late 1980s, since it did not produce the grand theories of foreign policy it aspired to. In the meantime, use of various methodologies and disagreements in how to study foreign policy pushed the subfield in a short-lived crisis from the 1980s into the early 1990s. One of the reasons behind this temporary crisis was the transition from the search for a grand theory and solely empirically oriented research (the gradual vaporization, or more accurately reformulation, of CFP research) to the emergence of multiple approaches and methodologies. In addition, the unfolding events of the late 1980s that led to the end of the cold war and hence led to a new world of international politics also affected the study of foreign policy.

By the early 1990s, FPA as a field emerged with a relative consensus that midlevel theories served as new goals rather than a grand theory of foreign policy. As such, these theories explicitly stated their limitations and the conditions of applicability. In this process, the CFP approach also refined its search for a grand theory of policy as it looked for new directions in the study of foreign policy.² Since then, midlevel theories have shaped the FPA literature.

Contemporary approaches to the scholarly study of foreign policy have developed within this context and can be divided into literatures that focus on (a) individual, (b) group, and (c) societal characteristics of foreign policy actors. In the following section, first each is discussed as to their assumptions about the importance of these levels of analysis; then, their applications to foreign policy cases and empirical evidence for each are discussed.

Applications and Empirical Evidence

Theories of International Relations

Direct applications of IR as theories of foreign policy remain few in number. Despite the rarity of such work, we continue to benefit from the grand theoretical lenses of IR theories. For instance, a rare exception is Rittberger’s (2001) and his colleagues’ attempt to explain Germany’s foreign policy since its unification. A somewhat similar work is Sterling-Folker’s (2006) *Making Sense of International Relations Theory*. Otherwise, some realists attempt to apply realist theory to foreign policy (see Wivel, 2005); however, some realists debate this. In addition, Houghton (2007) discusses the gains from cooperation

between constructivism and FPA. These notwithstanding, the majority of IR research explains state behavior as an outcome of overarching processes or the international system.

Approaches to Foreign Policy Analysis

Arguably, the most important contributions to the sub-field of FPA came from domestic-based explanations. Responding to a call to understand the foreign policy decision-making process and benefiting from various fields of research, many works contributed to the expansion of knowledge in the study of foreign policy.

Individuals

Foreign policy decision makers are individual actors, and as all individuals, they too are bounded by the human mind. Hence, individual characteristics of decision makers (such as their beliefs, experiences, emotions, and conceptions of the self and nation) can have significant impact on foreign policy decision making. This effect may be higher under certain circumstances, such as during crises when an individual has to make a decision under stress and time pressure and possibly with limited information.

Research on individual characteristics of leaders benefited significantly from the field of psychology. For instance, in *Perception and Misperception in International Politics*, Jervis (1976) illustrated the importance of psychological factors in his investigation of the impact of misperceptions in foreign policy. Likewise, Vertzberger's (1990) *The World in Their Minds* looked at the impact of information processing on foreign policy decision making. Various other works deriving from psychological approaches all share the assumption that studying political leadership offered a lot to explain foreign policy. The interest in the psychological characteristics of decision makers has expanded to various specific topics; here, operational code and leadership trait analysis are discussed as examples. Other relevant research studies the impact of bounded rationality, motivated and unmotivated bias, cognitive maps, scripts, and schemas on foreign policy making.

Operational code analysis entails the study of the core belief system of an individual leader. In most contemporary examples of operational code analysis, operational code refers to a leader's beliefs about the political world and also his or her approach to political action. Operational code research goes back to Nathan Leites's works on the Soviet Politburo and the Bolshevik Revolution. Later, George (1969) further developed the concept as he refined operational code into a belief system composed of five philosophical beliefs and five instrumental beliefs (also see Holsti, 1970; Walker, 1977). The most significant stride in this research was the introduction of automated content analysis in the late 1990s (for a recent review, see Schafer & Walker, 2006a). Since then, the less time-consuming nature of machine coding attracted more attention to operational

code analysis. Among others, for instance, Schafer and Walker (2006b) illustrated that Tony Blair and Bill Clinton had different views of democracies and nondemocracies, and their actions also differed accordingly. They show that democratic leaders hold a cooperative orientation toward other democracies.

Another important approach to how psychological characteristics of political leaders affect their foreign policy choices is the Leadership Trait Analysis (LTA) framework, a research identified with Margaret Hermann. This particular line of inquiry derives from the assumption that leaders have different styles of decision making because leaders interact with their subordinates, close advisers, or other leaders in different manners, and they follow a different set of principles or rules as they interact with others. Hermann's decades-long research now covers 122 national leaders and 87 heads of state from around the world and suggests a set of different leadership styles. According to Hermann (2003), the most useful traits in assessing leadership style are (a) the belief that one can influence or control what happens, (b) the need for power and influence, (c) conceptual complexity (the ability to differentiate things and people in one's environment), (d) self-confidence, (e) the tendency to focus on problem solving and accomplishing something versus maintenance of the group and dealing with others' ideas and sensitivities, (f) general distrust or suspiciousness of others, and (g) the intensity with which a person holds an in-group bias. The LTA has proved to be a fruitful line of research (among many others, Kaarbo & Hermann, 1998). Recently, Dyson (2006) showed the significance of Tony Blair's personality and leadership style in explaining British foreign policy making during the 2003 Iraq War. Dyson found that Blair had a high belief in his ability to control events, a low conceptual complexity, and a high need for power; Blair's preferences and behavior as derived from his personality profile corresponded to Blair's Iraq decisions. Dyson's work is a good illustration of how individuals matter in foreign policy decision making.

Groups

Individual decision makers often interact with other individuals as foreign policy decisions are formulated. These interactions may take place in either small or large groups but always under the unique settings of the group that are created purposefully or inadvertently. Hence, the structure of a group of individuals and the process of decision making therein become a concern for scholars of foreign policy. For instance, Kaarbo (1998) studied the dynamics of coalition cabinet decision making in parliamentary systems (also see Ozkececi-Taner, 2005). As discussed later, this concern mainly derives from the fact that individuals in group settings strive to conform to others—which hampers decision making in a way that reduces alternatives being discussed or leads members of the group to wrongful interpretations of the reality.

The study of decision-making dynamics in small and large groups also benefited from the field of psychology and has continually attracted foreign policy scholars to conduct further research about its effect on foreign policy decision making. The groundbreaking work was Janis's (1972) *Victims of Groupthink*. In this book, Janis illustrated that small groups of decision makers were prone to ignore, misinterpret, or even reject new information in order to avoid controversy and lack of cohesion within the group. During the 1990s, further research on this topic explored what happens beyond groupthink (Hart, Stern, & Sundelius, 1997), suggesting that there is more to explore than merely assuming that groups act differently and that contextual factors may affect the decision-making processes in groups.

A similar line of inquiry looked at the conflicts between different leaders and groups involved in decision-making processes. Initially introduced by Allison (1969), the bureaucratic politics approach, one of the three conceptual models used to explain the Cuban missile crisis, generated a lot of attention in comparative foreign policy analysis.³ Indeed, Allison's work about decision making in the U.S. and Soviet administrations during the crisis most deservedly became "the best known example of bureaucratic politics" (Kaarbo, 1998, p. 69). According to the bureaucratic politics model (BPM), policymakers compete with each other in a game of bargaining within the hierarchy of government. The model suggests that the hierarchical nature of decision making and power sharing promotes differences among players (Allison, 1969). Because every actor has different sets of objectives, actions result from bargaining games among them; as such, the BPM describes them as resultants rather than outputs. That is, the outcomes of bargaining games are often different from what was sought by each actor. Allison illustrates this approach with an analogy of foreign policy behavior with moves in the game of chess where "a number of distinct players, with distinct objectives but shared power over the pieces, were determining the moves as the resultant of collegial bargaining" (p. 691). Although the model faced harsh criticisms and was even discredited (Bendor & Hammond, 1992), one of the reasons for the continued interest in the BPM is the availability of new information about the Cuban missile crisis. As the official records of the Cuban missile crisis have been declassified, scholars of foreign policy have also refined the BPM.

Recent developments too have led to a renewed interest in the BPM. Specifically, policymaking after the September 11, 2001, attacks and in the months leading to and following the 2003 Iraq War during the administration of George W. Bush has attracted a lot of attention. Several studies discussed the competitive and fractionalized nature of decision making within the U.S. administration. It is, however, interesting to note that the BPM gains impetus from decision-making processes at times of serious conflict (Cuban missile crisis) or war (Vietnam and Iraq Wars; see Hudson, 2005).

In her research on minority influence over foreign policy decisions of coalition governments, Kaarbo (1998) argued for the merits of the perspective (power sharing, competitive decision making) and suggested that the model (its predictions and assumptions) itself might be dropped. Overall, along with these, possibly one last reason for the BPM's presence in the study of foreign policy has been that it is a simple, plausible, and logical framework (Rhodes, 1994).

Society

As factors beyond the individual and group level, national characteristics of a state can have a significant effect on its decision-making processes. The historical, socioeconomic, and political context of a society can all exert influence in foreign policy making. Societal sources of foreign policy range from culture and identity to elite and public opinion.

Now relatively an extinct research at this level of interest, but a lively one during the 1970s (see, e.g., East, 1973), is the effect of national attributes (size, political, and economic system, etc.) on foreign policy (where engaging in a war was often, if not always, the foreign policy event).⁴ Presently, the democratic peace research can be considered a remaining example of such an interest in national attributes. In addition, a new generation of event data sets, such as the Kansas Events Data System (KEDS), also belongs to this tradition (Breuning, 2007; Hudson, 2005, 2007). Distinct from the past endeavors, these new data sets do not reject the vital role individual decision-makers' play in foreign policy decision making (Breuning, 2007).

The study of culture as it relates to foreign policy analysis is a societal level of inquiry as well. Culture, according to Kaarbo et al. (2002), can "set [broad] parameters for foreign policy" (p. 15). For instance, cultural characteristics of a society can influence its decision-making processes: As Kaarbo et al. (2002) discuss, if consensual decision making is the practice in a country, then the making of a decision can take longer. Despite such recognition, research about the influence of culture on foreign policy remains a relatively less studied issue area. A major exception is an edited volume, *Culture and Foreign Policy* (Hudson, 1997). In a truly comparative framework, this book investigated the influence of culture on foreign policy in diverse settings like Belgium and the Netherlands, China, and India. For instance, Chafetz, Abramson, and Grillot (1997) used national role conceptions as a conceptual tool to explain how Belarus and Ukraine developed different approaches to nuclear nonproliferation. Chafetz et al. argued that the possession of nuclear weapons was incompatible with the Belarussian national role conception and hence Belarus immediately signed the Nuclear Non-Proliferation Treaty (NPT); Ukraine, on the other hand, desired such possession and because of inconsistent, multiple national role conceptions moved between complying

with and defying the NPT. Barnett (1999) also looked at culture as a factor affecting foreign policy. According to Barnett, Israel's acceptance of the Oslo Accords can be explained by Israeli Prime Minister Rabin's creation of a political culture that presented withdrawal from the occupied territories as a desirable and legitimate option for Israel.

In contrast to the research about the impact of culture on foreign policy, the study of elite and public opinion in relation to foreign policy is a rich area of research. Questions pertaining to the effect of public opinion on foreign policy have been contested in the foreign policy literature for decades and are but settled; moreover, the answers are significantly changed since the initial studies on this subject. As Holsti (1992) explained, the conventional view of the role of public opinion in the United States (the Lippmann-Almond consensus) was that it was "ill-informed, emotion-driven, shortsighted, and self-absorbed" (p. 514). Although this initial conception of the relationship between public opinion and foreign policy has long been challenged since the 1970s (see Shapiro & Page, 1988), there is not a new consensus yet (Holsti, 2002). We know that this relationship is complicated by the fact that government officials too attempt to shape public opinion (Foyle, 2004). There is more interaction and competition between the government and the public in an effort to shape the former's policies and the latter's opinion. Last, the subject definitely demands more attention especially at another time of war. As Holsti (1992) argued, research on the role of public opinion in U.S. foreign policy has been shaped by three 20th-century wars: World Wars I and II and the Vietnam War. It is later argued that in the post-September 11 world, the Iraq War constitutes a special place in understanding public opinion and foreign policy. Once again, another war led to tensions between the policymakers and the publics in various parts of the world.

Policy Implications

To what extent does the scholarly work in the FPA subfield affect real world policy? One of the goals of FPA scholarship is to produce useful knowledge for the practice of foreign policy making. It is, however, safe to argue that the relationship between the scholarly work and the practice of policymakers has been tumultuous at best. Although academics at times complained about the nature of policies, policymakers often distanced themselves from the abstract world of theories. George (1993) argued that the main distinction between the communities of scholars and policymakers is that each has different professional goals and indeed they cannot easily communicate with each other.

That is not to say, however, that academics and policymakers do not engage with each other at all. To the contrary, every now and then individuals go back and forth between

academia and the policy world. For instance, in the United States, some notable examples are Henry Kissinger and Condoleezza Rice; other examples around the world are relatively less known—if there are any at all.⁵ According to George (1993), these are indeed the individuals who can contribute to bridging the gap between the scholarly world and the policymaking world.

Future Directions

One can argue that although FPA as a field of study steadily progressed, it was a half-empty glass with a capability to deliver more.⁶ That metaphorical analogy has a legitimate reasoning; indeed, there is a lot more to be explored. For instance, there is not much work yet on integrating different factors influencing foreign policy into a comprehensive framework, or in particular areas of interest such as public opinion, we are relying on some specific contexts—in that example, on the U.S. context. In addition to such gaps in the extant FPA literature, other developments such as the availability of automated research techniques (see below) make new approaches to FPA possible. Here, some of the gaps and new opportunities in FPA research are discussed as possible future avenues of research in FPA.

In preceding sections, contemporary approaches to the scholarly study of foreign policy—other than IR theories—are discussed by dividing the literature to individual, group, and societal factors in foreign policy. Notably, there is no mention of studies that integrate multiple factors or levels of analysis. Indeed, there is a lack of multilevel (integrative) work in FPA. A major exception to this statement is Putnam (1988), where he argues that decision makers often find themselves in a simultaneous two-level game between their domestic constituents and international pressures. Further research on two-level games, or multilevel research in foreign policy analysis, remains an important but not much developed research agenda.

As discussed earlier, there is often an increased interest in foreign policy decisions and decision-making processes during war times. In the FPA literature, bureaucratic politics of decision making and the public's role in foreign policy often benefit from this interest. Yet the changing circumstances of world politics create new challenges and demand more work in explaining foreign policy decisions during wars. For instance, the processes of decision making in the U.S. administration during the 2003 Iraq War call for a renewed attention to bureaucratic politics of foreign policy. Similarly, the somewhat coordinated nature of protests across the globe during initial months of the Iraq War (likewise during the World Trade Organization meetings) constitutes an interesting topic to investigate. Furthermore, in the extant literature about the role of public opinion on foreign policy, there is a heavy focus on the United States; FPA will definitely benefit from expanding this view and

including more comparative cases about the influence of public opinion on foreign policy. Specifically, there is a dearth of literature on the role of public opinion in non-democracies. As Telhami (1993) showed the conventional wisdom here may not necessarily be true, and FPA definitely needs more research on the role of public opinion on foreign policy in nondemocracies.

Last, as more data become available, quantitative and automated approaches to foreign policy analysis will increase both in quality and quantity. For instance, Kansas Events Data System (KEDS) illustrates a successful research program in this particular type of research. Additionally, renewed interest in automated at-a-distance methods such as ProfilerPlus, which enables computer-based leadership traits and operational code analysis, signals such a direction in FPA (see Schafer & Walker, 2006a).

Conclusion

FPA, a subfield of IR, has significantly contributed to our understanding of world politics since its inception in 1954 (Snyder et al., 2002). It has provided a rich menu of approaches to explain and understand foreign policy in a generalizable way and beyond system-oriented explanations. Although this chapter draws only a broad picture of this literature, as discussed FPA captures multiple levels of analysis with detailed investigations of the role of individuals, groups, and states or societies. FPA also stands as a successful example of interdisciplinary work, particularly for its collaboration with psychology in explaining the influence of the individual on foreign policy. Today, students, scholars, and policymakers have many diverse tools for explaining foreign policy thanks to those achievements.

Notes

1. The discussion about IR theories is generalized and does not distinguish between the many different variances within each theory.
2. One must look at the product of this search for a detailed discussion: Hermann (1987).
3. For an expanded version of Allison's (1969) article, see Allison (1999).
4. Event data are records of interactions among states in the open press, and illustrate these in a sequence of a numerical score or a categorical code (for a detailed discussion see Phil Schrodt's essay in Neack, Hey, & Haney, 1995).
5. Kissinger was a faculty member at Harvard University and served first as national security advisor and then as secretary of state for Richard Nixon. Rice was a faculty member at Stanford University before becoming national security advisor for George W. Bush, and then she served as secretary of state in Bush's second term after her service, Rice returned to Stanford. An example from outside the United States is Turkey's minister of foreign

affairs since May 2009, Ahmet Davutoglu, who was senior foreign policy adviser to the prime minister from January 2003 until May 2009.

6. See, for instance, Vertzberger (2002).

FEMINIST INTERNATIONAL RELATIONS

KAREN J. VOGEL

Hamline University

This chapter is intended as a starting point for helping students understand the multiple perspectives and diverse approaches of feminist international relations (hereafter referred to as “feminist IR”). Rethinking topics of mainstream international relations (IR) in new ways, feminist IR critiques, expands, and deepens theories and methodologies that explain how global politics affect and can be impacted by gender. Feminist IR begins with exposing the experiences of women in international politics, explores how gender is socially constructed and what those social constructions do at both the local and the international levels, and uses gender as an analytical category in understanding the interconnectedness of international economic and political phenomena.

In this chapter, an overview of the literature on feminist IR is presented. First, some definitions and the evolution and history of feminist IR as a subfield are discussed, including a summary of the theoretical and methodological debates between feminists and mainstream IR scholars. Next, various methods of research and themes of feminist IR research are briefly described. Themes include perspectives on understanding war, militarism, and security; views of the state and sovereignty; discussions of globalization, development, and international political economy; and finally, transnational feminism and human rights. Third, the usefulness of feminist IR and how this research contributes to improving individuals’ lives as well as practical implications for international organizations are discussed.

Next, future directions for feminist IR are presented. And finally, the chapter concludes with an overall summary and a list of sources or references where students can learn more about the topic.

Beginnings: The Evolution of Feminist IR Theory

A good place to begin is with a brief discussion of definitions of feminism and international relations. Multiple definitions of feminisms exist in academic literature (see Tickner, 2002), and space here does not allow for detailed discussions of each. However, to give a general sense of these terms, feminist perspectives can be understood as philosophical theories, political views, and analytical approaches that call for social justice and the equal treatment of women, illuminate the nature of socially constructed and institutionalized definitions of gender, and seek the dismantling of oppressive structures in social, political, and economic life. In short, the key goals of most feminist agendas are to understand, to challenge, and to change women’s subordinate roles to men, whether that be in the community, the state, or the international system as a whole. These goals can be promoted by individuals of any gender, groups of any size or composition, meeting face to face or on the web, or working through states or international entities (Ferree & Tripp, 2006).

For many years, traditional, mainstream IR was understood in terms of the study of states and their foreign policies. The prevailing theoretical framework was realism that carried with it several key assumptions about states' interests and behaviors in the international system. In recent years, mainstream (IR) has broadened and seen the development of multiple theoretical and methodological perspectives. As Tickner (2002, 2005) found, constructivism, for example, which also helped to open the space for the emergence of feminist IR, appeared in the 1990s. It called for the acknowledgment that international structures and activities are not just determined by material forces but also based on socially constructed and shared ideas. Identities and interests of transnational actors are constructed by these shared ideas and not just objective facts of nature. Constructivism, as well as many other theoretical developments, expanded the understanding of IR as a field of study. Mainstream IR more generally is understood now as the study of global issues and their formation as well as the study of transnational actors, including states, intergovernmental organizations (IGOs), nongovernmental organizations (NGOs), and transnational corporations (TNCs) and their foreign relations.

Key themes in feminist IR theories and methodologies, therefore, combine elements of feminism and international relations. Feminist IR began with investigating women and their place in the world and analyzing why political science, and traditional IR in particular, seemed so distant from women's lives (Tickner, 2005). Over time, the sub-field has evolved to examining gender more broadly and exploring multiple aspects of inclusion and exclusion of gender in international political activities. In other words, feminist IR has become interested in more than just counting how few women served as ambassadors or in key leadership positions in international organizations. Feminist IR seeks to extend critical analysis by theorizing in ways that draw together race, class, gender, sexualities, and identities and by acknowledging that gendered structures exist in a variety of ways at local, national, and international levels.

Feminist IR tends to argue for understanding connections between both the domestic and international, starting at the bottom or with a microlevel perspective and moving up or to a more macrolevel understanding. The analysis of firsthand accounts, personal narratives, interviews, or participant-observer experiences in case studies tend to be more favored as important in shedding light on the complex interactions of gender and global and local phenomena. As many authors have observed, feminist IR takes the old feminist phrase "The personal is political" and transforms it to "The private is global" (Kantola, 2007), meaning that much can be learned about the world through this personal or face to face interaction.

Emergence of Feminist IR

Feminist theory and methodologies in general existed in other academic disciplines prior to impacting traditional

international relations and political science. For example, discussions about how humans know what they know, the need to be reflective and self-aware in one's research choices, and how to contextualize gender roles were prevalent in women's studies, sociology, philosophy, history, and literary studies in the late 1960s and 1970s. As Wibben (2004) recounted in her history of feminist IR, feminists were exploring male bias in research and methodology at interdisciplinary conferences as early as 1975—long before such questions entered the mainstream academic journals of political science or international studies.

However, as multiple perspectives of feminism developed, expanded, and permeated social science, academic work in political science, and international relations in particular, emerged as well. By the late 1980s and early 1990s, several conferences, journal articles, and books in political science featured empirical studies on women and global issues as well as discussions of various feminist theories and methods. Attention was being paid to identifying the use of gendered language in discourses on international issues; explaining the need for women to be recognized, not just as victims but as key players on the world stage; exposing the gendered nature of states and international organizations; and critiquing the male-dominated field of IR itself. Feminist IR argued that without understanding the relationships of gender and power in both domestic and international terms, traditional male-constructed categories of research and methodologies were missing half the picture. Only a partial view of the realities and inequalities facing men and women and in the political discourses of diplomacy, foreign policy, war, militarism, and security were being revealed.

Some early classic books dealing with these subjects include the following: *Bananas, Beaches and Bases* by Cynthia Enloe (2001, originally published in 1990), J. Ann Tickner's (1992) *Gender in International Relations: Feminist Perspectives in Obtaining Global Security*, and Peterson and Runyan's (2010) *Global Gender Issues*. More recent edited collections followed, focusing on debates about feminist realism and quantitative research versus postmodern, qualitative methodological approaches (See Ackerly, Stern, & True, 2006; Jonasdottir & Jones, 2009). Each of these works contributed in different ways to substantial, new insights and methods to study the role of gender in international politics.

Along with books and edited collections, specific academic conferences, panel presentations, and journal publications provided forums for the discussion of methodologies and theoretical directions. Since the 1990s, professional meetings of the International Studies Association, British Political Science Association, and American Political Science Association have all sponsored panels and special topic sections about feminist IR, including feminist IR epistemology; feminist theories and the state; feminist approaches to understanding war, militarism, and security; the emergence of transnational feminism; and the role

of gender in the policies of international organizations, just to name a few.

A new specialized, scholarly journal, the *International Feminist Journal of Politics*, founded by Jan Jindy Pettman of the Australian National University of Canberra in 1999, also legitimized feminist IR as an academic field of study. This peer-reviewed journal uses themed issues to address a number of feminist IR topics such as gender in conflict and post-conflict societies; ideologies, religions, and conflict; and by 2009, human rights and feminism. This journal, as well as the publication of numerous articles in other academic sources, such as the *British Journal of Politics and International Relations* (BJPIR), *Foreign Affairs*, *Gender and Politics*, and *International Studies Quarterly*, made visible feminist IR within the academic communities of political science and international studies.

Critiques and Debates:

Traditional IR Versus Feminist IR

The emergence of feminist IR has not been without criticism, and continuing debates over epistemologies, methods, and questions for research occur. Several articles trace, describe, and analyze the trajectory of these debates over the last few years. First is Cynthia Weber's (1994) piece titled "Good Girls, Little Girls, and Bad Girls." This work was penned in response to Robert Keohane's (1989) critique of feminist IR in which he argued that feminist analysis could only provide a limited insight into international relations. According to Keohane, feminist perspectives could help point to where women had been victims of patriarchy or left out of political processes but lacked the empirical strength of building testable hypotheses.

As Weber (1994), Sylvester (1994), later Tickner (1997), and Wibben (2004) note, Keohane (1989) missed one of the key points of feminist IR: that the object of study can be impacted by the observer and the observation itself, that concepts have contextual relativity and are flexible, and that traditional IR does not fully account for the dynamic, fluid boundaries of international relations and gender. Traditional empirical research and so-called testable hypotheses can have their own male biases that by their very nature may not include or take into account complex gender elements.

In particular, J. Ann Tickner's (1997) seminal article "You Just Don't Understand: Troubled Engagements Between Feminists and IR Theorists" explored in more detail why misunderstandings continued between feminists and traditional IR theorists. Her claim was that feminist IR was based on assumptions and epistemologies that were divergent from those that underpin the traditional discipline. Therefore, feminist IR did not fit easily with state-centric and structural, positivist approaches normally taken by traditional IR scholars. But that did not mean feminist IR should be ignored or dismissed as a lesser form of inquiry. Something was to be said for a menu of complex, rich, and diverse theoretical and methodological approaches, and feminist IR research with qualitative as well as quantitative

methods was needed to understand complex transnational, gendered relationships (see Tickner, 2005).

Following Keohane, Francis Fukuyama (1998) in his work on women and international politics pointed to the limitations of feminist IR. He suggested that feminists tended only to see men as aggressive and women as peaceful. As found by Wibben (2004), many feminist IR scholars responded to Fukuyama, arguing that he completely misread, oversimplified, or missed entirely the variety of theories and methodologies promoted by feminist IR. He did not understand that feminist scholarship revealed the fluid nature of definitions of gender and how the impacts and influences of those definitions played out politically. Feminist IR research did not assume that men and women always behaved the same way in every context but rather looked at the varieties of femininities and masculinities as they played out in gendered structures and institutions.

Feminist IR illuminated the male dominance in the field as a whole and affirmed the need to engage in feminist-informed research. As Charlotte Hooper (2001) noted in her work, *Manly States*, everything from the nature of the subjects to the methods of research to the lack of females in academic and international careers culminated in marginalizing and making invisible women's roles both as subjects of research and practitioners in the field. Feminist IR could expose gender-based distinctions in a number of traditional areas of IR research and explore a variety of research methods in the process, even if traditional IR still sought to marginalize the attempt. Sylvester (2002) further encouraged feminist researchers to think about the international and draw inspiration from other feminist writers. Interestingly enough, what has emerged in the last few years is a rich array of themes, methods, and knowledge that has provided additional insight into key aspects of international politics.

Themes in Feminist IR and Methods of Research

Just as debates have existed between traditional IR scholars and feminist IR researchers, differences in approaches, themes, and methods have also emerged with the feminist IR community. Feminist IR is by no means monolithic or wedded to one particular issue or topic within international studies. Indeed, many feminist IR scholars prefer not to be identified with one approach or a single, traditional disciplinary label (Tickner, 2005). As this section shows, various applications of feminist IR theories and methods abound. A brief description of types of methods used by feminist IR scholars are presented next, followed by a sample of some of the areas and questions explored in the feminist IR literature.

Types of Methods

Tickner is perhaps one of the most well-known and prolific feminist IR writers to discuss these issues. From her

earliest articles and books in the 1990s to her discussion of feminist IR methodological questions in the *International Studies Quarterly* (2005), she has provided key insights into the patterns of feminist IR work. She has described and analyzed many of the questions that feminist IR theorists ask as they engage in the process of research as well as the types of research tools they employ.

Tickner (2005) affirmed that no single or unique method of feminist IR exists and a variety of research tools are necessary to address gender and international politics. However, adapting research methods from other disciplines is one of the hallmarks of feminist IR. For example, ethnography, a tool more often used by anthropologists; literary theory and analysis of life narratives, borrowed from studies of literature and humanities; alternative ways of seeing or locating what is missing from a picture or situation, taken from the study of fine arts; and analyses of symbols, language, and phrasing, taken from communication studies and rhetoric, have all been used as interpretative methods of research. Case studies, philosophical argument, and participant-observer techniques too have been applied in various ways to provide insights into gender and its connections between local and global politics (see also Ackerly et al., 2006; Prügl, 2007).

Feminist scholars tend to view quantitative techniques with some skepticism and wariness when trying to talk about inequality or forms of subordination. Gender inequality, for example, may not be easily indexed or measured by a single variable because of the complex historical, sociocultural power relationships, or even differing perspectives regarding the understanding of what the term *inequality* means (Tickner, 2005). Waring (1988) has also elaborated on problems of doing quantitative work with large data sets that rely heavily on information gathered from state accounting systems. Often, governments do not include statistics on women's unpaid labor, for example, or clear information about who really is head of the household. Single women or women of a particular ethnicity or class may be completely left out of certain categories (Waring, 1988). Through the 1980s, even cross-national statistics on development or human rights supplied by the United Nations or the European Union were incomplete or inadequate when describing gender differences and therefore suspect if used in large quantitative studies to explain some gender patterns.

More recently, some feminist IR scholars have returned to quantitative techniques or found ways to combine both qualitative and quantitative research. Caprioli and Boyer (2001), using the International Crises Behavior Project data set, employed multinomial logistic regression to analyze whether a connection existed between domestic gender equality and states' use of violence internationally. With improvements in data collection in United Nations and European Union agencies since the late 1990s, as well as attempts at gender mainstreaming (bringing women into the decision-making process and taking into account the impact on women of policy) within these organizations, renewed

interest in using quantitative tools has emerged within some parts of the feminist IR community, especially when considering issues surrounding women's labor and the global economy or issues of human security. However, feminist IR scholars still caution that one must not be unreflective in thinking about how specific data are collected or for what purpose (Carney, 2004). How quantitative research can evolve and be made more applicable for feminist IR remains an ongoing question for exploration and debate.

Themes in Feminist IR

No matter what their methods, as Prügl (2007) points out, feminist IR scholars are remarkably reflective, self-aware, and conscious about their relationship to their subjects of study. They seek to make visible or to bring to light ideas, experiences, and phenomena related to gender and international politics that may have been hidden or ignored. This can be seen in their approaches to themes of war, militarism, and security; sovereignty and the state; globalization, development, and international political economy; and transnational feminism and human rights. Within each of these topics, feminist IR scholars attempt to show how an analysis of gender-based distinctions can enhance knowledge about human beings and the world. And even though these themes are set out in separate subsections here, quite often feminist IR scholars point to the interconnections and influences of each on the other.

Sovereignty and the State

One of the earliest areas of inquiry for feminist IR revolved around a critique of core IR concepts, in particular, understandings of the state and sovereignty. Kantola (2007) has provided an excellent summary and analysis of feminist theories and research about gender, the state, and issues of sovereignty. She identifies three general areas of literature and in the process unpacks concepts of gender, power, and state characteristics. The first category of literature incorporates both feminist IR and comparative politics perspectives and methods. The main goal of this work was to ask questions about the inferior position of women, the lack of position for women, or both in the social, economic, and political processes of the state. This literature revealed the continuing absence of women in decision-making roles related to foreign policy and international affairs, whether that be in terms of being elected to political office or appointed to key positions in key decision-making arenas (Kantola, 2007).

Women and the state are clearly defined variables. The state tends to be seen as a unitary entity, with identifiable institutions and structures. The actions of states can be detrimental or beneficial to women, and power is described in a top-down, binary fashion—either one has it or does not. The category of women also tends not to be broken down or disaggregated to take into account the different ethnicities or economic backgrounds of women.

What becomes important is simply to show where women have been present or not in state activities. The overall purpose of the research is that by revealing these inadequacies, equal treatment and access for women in these structures might be addressed. (See Kantola, 2007.)

The next area of literature includes feminist IR scholars who begin to move beyond the notion of women as a variable to gender as a broader social construct and analytical category (see also Zalewski, 1998). Rather than focus only on the exclusion or marginalizing of women from the state and the international system, these analyses move toward identifying the gendered nature of the state itself. As Kantola (2007) found, within these studies, the relationship of the state and gender can be reciprocal and constitutive—that the state can be as dependent on gender for its construction and survival as social constructed definitions of gender might be affected by the state. Power is understood as more diffuse and variable, and the state is more than a fixed, abstract thing. It becomes part of a fluid set of processes whereby certain activities involving men and women can work to support or to undermine state authority and position in world politics.

As gendered characteristics of the state are analyzed, a picture of how gender becomes critical to sovereignty emerges. This picture is what informs the third, developing area of literature analyzed by Kantola (2007)—that of the gendered reproduction of the state and debates about state sovereignty and its primacy in the international system. This literature critiqued the traditional understanding of sovereignty, examined debates about whether the state is starting to give way to international and regional organizations, and explored the possibilities that even international and regional organizations are gendered and reproducing state characteristics at a macrolevel.

In general, the traditional understanding of sovereignty has to do with a state's right to govern and its ability to operate independently in the international arena. The concept is understood in political science as related to territories, population, recognition, and authority (Kantola, 2007). Feminist IR has been engaged in deconstructing these aspects of sovereignty for some time, demonstrating that territories and populations are not fixed and indeed the manipulation of gender roles by the state (access to reproductive rights, controls over women's labor, etc.) can play key roles in legitimizing its authority.

However, understanding the complexities of sovereignty is only part of the issue. The intersections of local, national, and global levels are important when talking about states, and the state should be understood in terms of both discursive and structural processes, not just as a unified, unchanging, neutral entity (Kantola, 2007). Gender can matter in the legitimizing of the state and in the gendered and gendering nature of international organizations. Although some of the recent IR literature has suggested that the state is disappearing, other evidence suggests that the state is very much alive and well and in

partnership with international organizations that reinforce gendered characteristics and behaviors. Only through illuminating the continuing gendered and gendering aspects of these structures and institutions can human beings begin to also understand the full complexities of their policies and their effects.

War, Militarism, and Security

In rethinking war, militarism, and security, feminist IR explores to what degree gender as an analytical category can reveal a more complex and complete understanding of violent conflict and its affects on men and women. Sites of inquiry include definitions of war; the impact of war on gender and vice versa; why wars happen and how constructed notions of masculinity and femininity can legitimate militarism and the state; the gendered nature of post-war conditions; and the definitions and policies of security, insecurity, and human security. Several contributions in these areas are noteworthy.

For example, Laura Shepard has recently critiqued the war–peace dichotomies that appear in so much IR literature. She showed how an emphasis on only war or peace can miss the politics of everyday violence, what she described as the violence of in-between times (Shepard, 2009). This violence, which can involve attacks on refugees, recruitment of child soldiers, or the trafficking or forced labor of women, is often left unnamed or unrecognized by the international community.

At the same time, the focus of feminist IR has not just been on women and children as victims of war. As Kelly (2000) and others have noted, in times of war, women can challenge traditional feminine roles, become heads of households, work in nontraditional jobs outside of the home, and even bear arms or serve as soldiers themselves. Women's agency and sense of empowerment can be enhanced by wartime conditions. Furthermore, women's and men's activism in organizing and promoting peace movements can also play out in ways that do not necessarily coincide with stereotypes of masculine and feminine roles and perceptions of war. As El-Bushra (2007) found, rather than viewing conflict as only a violation of women by men, researchers need to think about how men and women are each differently violated by war and what they do about it.

Feminist IR has also recently engaged with scholars who are articulating and analyzing so-called new wars. Mary Kaldor (2006), for example, has pointed to the need to rethink definitions of war and the role of the state. Using Bosnia and Herzegovina as an example, Kaldor examines how the purpose, methods, and financing of war has changed. Where war used to be conducted only by organized states and launched for the purposes of territorial gain or to justify the goals of a particular ideology, many contemporary wars tend to be about identity politics, conducted by decentralized groups, and using methods that

instill fear or create more civilian casualties. Even the financing of such conflicts has changed and become more diffuse and not necessarily dependent on state resources. Peterson (2008) has drawn on Kaldor's work and the literature of international political economy to talk about how these new wars and the economic means of supporting them are gendered as well.

Feminist IR has also explored why wars, new or old, happen and how conflict impacts gender and vice versa. Goldstein's (2001) ambitious work, *War and Gender*, which attempted to bridge traditional IR and feminist IR approaches by using a combination of positivist research and notions of gender as a constructed concept, contributed to the discussion by arguing that connections between war and gender are persistent and interconnected across cultures and time. Killing in war is not natural for either gender, yet the potential for war has been pervasive in all human societies.

Additional feminist IR work has argued for a focus more on militarism and its effects rather than examining just the causes of war. Here, the idea is that militarism itself legitimizes violence as a way to resolve conflict and carries with it the means of redefining gender roles in order to support that behavior (see Kelly, 2000). For example, work has been done on the usage of rape in war, the trafficking of women and children for the purposes of forced prostitution and who benefits, and the impact of posttraumatic stress on both women in the military and on families after troops return home.

The feminist IR literature on security takes research in new directions as well and often interconnects with discussions of conflict and militarism. Again, Tickner (1997, 2002) has been instructive here. She explained that feminist IR scholars have challenged traditional IR's understanding of security as protection of territory or material wealth. Feminist IR sees security more broadly, noting the centrality of the human subject and revolving around protection against all forms of violence, including physical, structural, or ecological. (See also Carpenter, 2005.) To achieve security, one must understand different social hierarchies, the foundational stories and male discourses that support them, and how those same hierarchies influence and may be constructed by various forces in the international system and somehow work to change them.

Influential in some feminist perspectives on security was the publication of the United Nations Development Report (United Nations Development Programme, 1994) that first provided a definition for the term *human security*. The report argues that human security requires the protection of human lives in ways that enhance and support human freedoms and potential. Feminist IR research, although acknowledging the potential of this concept, continues to ask probing questions about whether UN attempts at human security programs fall short and how such policies may still be affected by gender distinctions or limited by Western biases or aspects of the global capitalist economy.

Globalization, Development, and International Political Economy

Feminist IR has also tackled the gendered aspects of globalization, development, and international political economy, redefining these terms and contributing to a wider understanding of men's and women's experiences of political, social, and economic relations. For example, Ruth Paterson (1999) has been an important contributor in this literature. For her, globalization should not be narrowly defined in terms of the international exchange of material goods or the flow of international trade. The study of international political economy should not be limited to the analysis of trade agreements or the work of the International Monetary Fund, the World Bank, or the World Trade Organization or states' political and economic interactions. Globalization, development, and the studies of international political economy need to be conceived in much broader terms and involve the spheres of women's work and activities. Studies should explore to what extent or how gender has mattered and to what degree women in particular may have been disadvantaged or advantaged by certain gendered structures and institutions. Traditional international political economy must be challenged to recognize that the household and private domains where women may dominate are critical in fleshing out connections between economics and politics in all domains (see also Tickner, 2005).

Feminist IR has indeed moved in the direction of focusing on the local experience of women in order to understand larger global economic and political issues. Some interesting and important contributions have included the following: Christine Chin's (1998) book on Filipina and Indonesian female domestic workers in Malaysia, which demonstrated the connections among women's labor, the state, and modernization projects and Elizabeth Prügl's (1999) work, *The Global Construction of Gender: Home Based Work in the Political Economy of the 20th Century*, where she explored numerous links between women's work and economic and political issues.

Transnational Feminism and Human Rights

In the last 5 years, feminist IR has also turned its attention to a critical examination of issues of human rights and the emergence of transnational feminism. Transnational feminism, often used more as a descriptive term than a theoretical framework, refers to the existence of issues, advocacy groups, and organizations across borders and cultures that are interested in the treatment and condition of women (Desai, 2007). The issues that occupy transnational feminism go from a focus on political representation to a concern about economic and social conditions experienced by women in the South and developing or underdeveloped countries as well as in the developed global North. The United Nations has been perceived as the center for

consensus building about these issues, particularly with the creation of key documents like CEDAW (Convention for the Elimination of Discrimination Against Women) and practices such as gender mainstreaming, which advocated for the representation of women in government structures and international organizations for the purposes of drawing women into policy-making processes.

Three edited collections have made significant contributions to the study of these topics: Meyer and Prügl's (1999) *Gender Politics in Global Governance*; *Feminist Politics, Activism, and Vision: Local and Global Challenges*, edited by Ricciutelli, Miles, and McFadden (2004); and *Global Feminism: Transnational Women's Activism, Organizing, and Human Rights*, edited by Ferree and Tripp (2006). A new work by V. Spike Peterson and Anne Sisson Runyon (2010) tackles global gender issues and the importance of understanding gendered lenses on world politics. In these works, feminists investigate what role transnational feminist networks play inside and outside the international system; to what degree international and regional organizations have remain gendered even with the growing consensus about the need for women's participation; and what challenges remain in understanding diversity, multicultural perspectives on human rights, and indeed connections between global and local agendas.

Usefulness of Feminist International Relations and Policy Implications

One of the shared desires among practitioners of feminist IR is that their research be useful to both women and men, whether that be at the level of international organizations or in individuals' day-to-day lives. In the United Nations or the European Union, practical implications can range from the method of collecting data and its interpretation to the usage of those interpretations in determining policy. With gender mainstreaming, for example, intellectual theorizing, advocacy for inclusion, and real-world policy meet. Women have started to be included in some of the bureaucracies, decision-making processes, and programs of these organizations. However, problems still exist in recognizing diversity, acknowledging multicultural and cross-national differences of men and women, and in being self-conscious, reflective, and careful in understanding the gendered nature of policy practices (Carney, 2004).

Along with impacting how data are collected and interpreting policies at either the state or the international level, feminist IR research itself can positively affect individual lives. One interesting example is the work of Maria Mies as described by Tickner (2005). Mies conducted research on sexual violence against women among rural women workers in India. Instead of remaining a distant observer or doing research for only an academic purpose, Mies invited the women of the area who were subjects of the study to participate in research of the researchers as well. All the

results were translated into the local language of Telugu and made available to all. As Mies noted, the process sparked self-confidence among the women and allowed them to work collaboratively together to initiate new solutions and programs to benefit the community as a whole (cited in Tickner, 2005).

Another example of theory and practice coming together is the work being done by McGill University on human security, gender, and peace (Boyd, 2005). Their research and activities have resulted in special refugee programs in Montreal, supporting regional peace initiatives in various parts of Africa, and training for those who work with traumatized victims of war-torn countries worldwide. A central value in their approach is sharing the knowledge gained from groups and translating that knowledge into practical action whenever possible. As feminist IR scholars continue to invite conversation and collaboration with their subjects, no doubt practical implications and creative directions for new research will emerge.

Future Directions

The future directions for feminist IR are numerous, and only a few can be mentioned here. First, although feminist IR theory has created a space for the exploration of a variety of perspectives and topics, more work still needs to be done in examining or even acknowledging non-Western discourses about knowledge, transnational communities, and gender. As Giorgio Shani (2008) suggested, one future consideration for IR might be the exploration of various Islamist or even Sikh viewpoints on universality of culture, community, and politics and how those views intermix with diverse constructions of gender and social behavior.

Another dimension might be further investigation of the emergence of so-called NGO-ization of women's movements and advocacy groups. NGO-ization refers to the proliferation of formal women's NGOs, especially in regions such as the Middle East, sub-Saharan Africa, or even central and eastern Europe. On one hand, these organizations can be viewed as a promising sign of civil society and empowerment of women; on the other, they can be affected by the agendas of international donors, support of UN agencies, and other Western groups, sometimes fragmenting or weakening the possibility of sustained social change (Jad, 2003; see also Kamrani, 2007). Additional analysis might provide an expanded and deeper understanding of the ways these organizations work, where gendered discourses and distinctions may still come into play, and what their roles are in shaping international politics.

Another area of growing research currently involves how queer theory might contribute to feminist IR. Queer theory, as a critical theory of power, sex, and sexuality, can provide an additional lens for examining and understanding social realities and international politics. Here, queer theory and research can point to issues of human rights, variations

of definitions of masculinities and femininities, and how these can enhance understandings of gendered structures and institutions (Kinsella & Holm, 2007).

Finally, continued work in the development of research methods is another area important to both feminist IR and the field of political science as a whole. Expanding a menu of methodological choices with interdisciplinary, qualitative, and quantitative tools can only help to yield more and more sophisticated causal and constitutive understandings of gender and global politics.

Conclusion

This chapter summarized some of the key themes, theories, and methods associated with feminist IR. Like other reviews of feminist IR literature, the purpose here was not to be fully comprehensive or to somehow provide a complete description of how every aspect of feminist IR works. Instead, the intention was to give students of political science a brief sense of the key issues and debates. What students should take away from this overview is that feminist IR has expanded and increased knowledge about gender and global issues. Some of the main contributions include a critique of the methods of research of traditional IR; a reexamination of war, militarism, and security; the state and sovereignty; globalization, development, and international political economy; and finally, continuing investigations of transnational feminism and human rights.

Even though the contributions of feminist scholars have been extensive in the scholarly literature since the 1990s, feminist IR perspectives are still slow to reach undergraduates in the United States. As a recent survey revealed, only about 5% of faculty teaching international relations in the United States devote time in class to discussion of feminist IR, and about 13% of faculty use textbooks on international relations written by women in their classrooms (Jordan, Maliniak, Oakes, Peterson, & Tierney, 2009). Even though academic research and publication on international gender issues has blossomed, classroom discussion of these topics remains limited. It is to be hoped that this review of feminist IR gives students a good place to start their own inquiries about gender and international politics. A list of references and further readings follows.

LEADERSHIP AND DECISION MAKING

TOBIAS VAN ASSCHE

University of Antwerp

Studies of political leadership, which are mostly applied to the foreign policy and crisis management domains, examine how the behavior of individual political leaders can have an impact on policy-making processes and how this can affect what types of decisions are made. This literature draws on psychology to identify personality characteristics that can have an important effect in the political realm and then uses these characteristics as independent variables to explain how they might influence the political process. These characteristics can be very stable, such as personality traits, or can be more volatile over time and content matter, such as cognitions and motives. Individual leaders are one of three forms of decision units that are used to explain types of outcome in foreign policy decision making. Other types of decision units are a single group and a coalition of autonomous actors. This section mainly focuses on political leaders.

After discussing why and when studying political leadership is important, this chapter goes on to discuss three different aspects of a leader's personality that can influence the political process: motives, cognitions, and traits. Next, it describes how some studies have attempted to combine three components to more accurately explain political behavior and outcomes. Finally, areas of future research are identified.

Why Is Studying Political Leadership Important?

In 2003, U.S. President George W. Bush decided to invade Iraq and forcefully remove its authoritarian president, Saddam Hussein, from power. This policy was very different from the first Gulf War since the United States accomplished its objective with the help of a much smaller coalition of countries that did not involve some of the traditional allies, such as France and Germany, and without support of the United Nations Security Council. Despite these international constraints and weak evidence concerning the *casus belli* (cause of war)—weapons of mass destruction—the president and his advisors strongly believed that invading Iraq was necessary and feasible. What the policymakers did not anticipate was that it would draw the United States into a prolonged conflict in Iraq, that weapons of mass destruction would not be found, and that it would drain resources from the war in Afghanistan, which was being conducted simultaneously. What makes this case interesting for people studying political leadership is that it was a war of choice, not one of necessity—a choice made by the president. In a case such as this, one therefore cannot help but wonder if a different leader would have taken an alternative course of action. What

would have happened if the Supreme Court had declared Al Gore the winner of the 2000 presidential elections? Would he also have chosen to invade Iraq, or would he have selected a different course of action to deal with Saddam Hussein?

The 2003 Iraq War is just one of a large number of international cases where the person in charge appears to have played a vital role in its outcome. Robert Kennedy, the U.S. Attorney General and brother of President John F. Kennedy, for example, stated about the EXCOM—the group of high-level policymakers who dealt with the Cuban missile crisis—that “if six of them had been President of the U.S., I think the world would have been blown up” (Steel, 1969, p. 22). One could also argue that Saddam Hussein played an important independent role in his country’s decision to invade Kuwait in 1990 (Post, 2003b), or that Woodrow Wilson’s self-defeatist behavior influenced the outcome of the Versailles Peace Conference, which brought World War I to a close (George & George, 1956).

Although political leaders make important decisions on a daily basis and are directly linked to decisions that the administration makes, it is also important not to fall into the trap of attributing every international event merely to the personality of the participating countries’ elites. There are many patterns and specific situations in international relations when one does not need to look at who was in charge to explain the outcome. The personalities of the U.S. presidents during the cold war did not affect the stalemate between NATO and the Warsaw Pact, and it is not necessary to know who is in charge in Britain and France to explain why these countries no longer fight each other. The personality of the political leaders does not matter in these conditions because their beliefs and perceptions can largely be explained by the situation. Most leaders would act similarly in these conditions.

In studying political leadership, we are particularly interested in examining the various aspects of the decision-making process, relying on psychological frameworks within an institutional setting, in cases where it not only provides us with a more in-depth understanding of what happened but also makes it possible to explain significant additional variation in outcomes. We want to examine cases where the leader really made a difference.

The need to analyze political leadership has increased considerably following the end of the cold war, since there no longer is an agreement on the way in which the world is structured. Because of the threat of World War III and mutually assured destruction during the cold war, it was clear that no leader would significantly challenge the status quo, so conflicts were limited to the peripheral areas such as Vietnam and Korea. Since the fall of the iron curtain, and the Soviet Union in particular, this is no longer the case. There is now much more room for interpretation, innovation, misunderstanding, and miscommunication than when a bipolar world system dominated

international interactions (Hermann & Hagan, 1998). For instance, there is no agreement on how big the threat of Islamic terrorism is; it is unclear to what extent China, Russia, and the European Union are threatening the United States in its hegemonic role; and countries such as Iran and North Korea are very unpredictable in their pursuit of nuclear weapons. How the elites interpret this unstable environment is thus increasingly important.

Understanding the influence of political leaders is not something that is only interesting to academics. Branches of the U.S. government such as the CIA often draw on analyses of elites to assist in the policy-making process (Post, 2003a). One classic example is how U.S. President Jimmy Carter relied on personality profiles of Israeli Prime Minister Menachim Begin and Egyptian President Anwar Sadat during the Camp David negotiations, which led to a peace treaty between the two countries. The profiles, constructed by leading political psychologists, warned the president that the personalities of the two leaders conflicted significantly; Begin was very detail oriented, while Sadat focused more on the big picture, which could significantly complicate negotiations. Based on this information, Carter designed a strategy that eliminated direct contact between the two protagonists and allowed him to act as a middleman. To this day, experts in political leadership cooperate with other academics such as cultural anthropologists to advise the U.S. Government.

When Is the Decision-Making Process Important?

Since it is not always equally necessary to focus more narrowly on the decision-making process to understand why a country acts the way it does in the international arena, it is important to identify under which conditions leadership and the decision-making process are most likely to have an autonomous impact. As Post (2003a) states, the goal is to distinguish between situations that conform to the “covering-law generalization from a structural theory about a universe of cases or deviates from it due to the operation of intervening causal mechanisms between structural conditions and decision outcomes” (p. 64).

Scholars have been able to identify certain conditions in which the decision-making process is more likely to have an important independent impact. Hagan (2002) states that the decision making process is particularly important when the leaders (a) face real uncertainty in responding to international threats; (b) are confronted with trade-offs across competing goals, including that of retaining power; and (c) operate in decision structures in which political authority is quite dispersed and fragmented. Examining decision making in these conditions is important because a lack of information and goal certainty makes it very difficult to determine the rationally optimal

course of action. The outcome will thus strongly rely on “how leaders perceive and interpret the threats based on their belief systems” (Hagan, 2002, p. 11). One could thus expect that in these cases different types of leaders might react differently.

One specific situation in which the decision-making process can play an important role is in a crisis (Hermann, 1976). A crisis is defined as a situation in which the policymakers perceive uncertainty, a threat to core values, and time pressure. In these conditions, policymakers are forced to make quick important decisions, often with limited information. Because they are not necessarily able to have access to all information and have to deal with issues such as stress (Janis, 1982), psychological factors and the nature of the decision-making structure can become important (Vertzberger, 1990). This was exemplified in Jervis’s (1976) groundbreaking work in which he discusses how perception and misperception can influence international politics.

It is important to stress that political leadership can be a necessary factor to explain why a certain event happened, but it is never sufficient. A political leader can be important because of the way in which this person interprets the environment, but it is the context and conditions that matter primarily. Elites only determine to what extent and in which fashion cues from the environment are interpreted.

Political Leaders as a Decision Unit

The personality of political leaders is not the only factor that can influence how decisions are made. The literature on foreign policy decision making, building on classics such as Graham Allison’s (1971) *The Essence of Decision*, distinguishes among three types of decision units: a single group, a coalition of autonomous actors, and a powerful leader (Hermann, 2002). It is important to distinguish among these three types, because different factors influence how these distinct decision units come to determine a policy. The first type is a single group. This is a group composed of two or more policymakers in which all members are necessary to make the decision to commit resources. Examples of a single group are the EXCOM during the Cuban missile crisis and President Lyndon Johnson’s inner cabinet during the Vietnam War. Since the focus is on how a group of people comes to a decision, the main variables used to explain how this decision unit selects a policy are derived from the study of group behavior in social psychology. This is because in a single group, decisions are made through a collective, interactive, decision process, in which all members participate. The focus is therefore on factors such as group pressures and the presence of a minority.

A second decision unit is a coalition of autonomous actors. This decision unit is composed of a group of independent actors who need to work together to come to a decision. Although the group members can share common

goals, their primary loyalty is not toward the coalition. They have their own constituency that they are accountable to. In the United Nations Security Council, for example, the member countries do not act as a single group. Their primary loyalty does not lie with the United Nations but their respective countries’ self-interests. The same can be said for the political parties that compose a coalition government. This decision-making unit focuses more on the types of decision rules and factors that can help actors with different positions come to an agreement.

The focus in this chapter is on political leadership, or situations where an individual is obliged to, or chooses to, take the authoritative decision. This type of decision unit is predominant in countries or international organizations where one individual is vested with the authority to commit or withhold the resources of the government with regard to foreign policy matters (Hermann, 2002). Here, the focus is on individual leaders and how their personalities can influence the decision-making process and policy outcome. Who is in power can affect what information is taken into account, what factors motivate a decision, and how the advisory system is structured (who takes part in which format; Hermann & Preston, 1994), and so on. The predominant leaders are particularly likely to be found in authoritarian countries and dictatorships such as Mugabe in Zimbabwe and Lukashenko in Belarus but can also be important in countries such as the United States, where the president enjoys a lot of independent power in the foreign policy realm, among others. The systematic influence of leadership can also be detected in other cases such as international organizations and conditions where the leader is first among equals, but in these conditions, the individual impact will be a lot less direct and therefore more difficult to detect or measure. They can, for example, attempt to set the agenda or try to persuade other important actors, but their policy preferences do not deliver direct results.

Psychoanalytic Studies of Political Leadership

The study of political leadership emerged in the early 20th century with the rise of psychoanalysis, most famously associated with the work of Sigmund Freud, in which an important figure’s behavior is explained by investigating his or her formative period. Scholars started using these Freudian techniques to analyze why an individual leader acted the way he or she did at a certain time, or to explain his or her overall behavior, in what came to be called psychobiographies. The root causes in these studies are often the individual’s relationship with parents, childhood traumas, or formative events. A classic example is Juliette George and Alexander George’s (1956) study of Woodrow Wilson.

There have also been attempts to move beyond explaining individual behaviors using psychoanalysis and move toward a more comparative approach. An example of this is James Barber’s (1992) study of the U.S. presidential

character, which was originally published in 1972. He claims that the U.S. presidents can all be categorized as being active or passive in the amount of energy they put into the job and can be either positive or negative based on the satisfaction they get from the position. A combination of these two factors then determines success or failure in office. Barber argues, for example, that an active–negative president such as Hoover, Johnson, and Nixon is the most dangerous because these types of leaders tend to be compulsive, while an active–positive president such as FDR, Clinton, and Carter is most likely to succeed because these types of leaders tend to be more adaptive.

Although Barber’s model remains extremely popular in classrooms, psychoanalysis is no longer widely used to explain political behavior. This is because this method is not focused on creating testable and generalizable hypotheses but instead wants to explain one individual’s behavior in very specific circumstances. Even if more psychoanalysts wanted to follow Barber and create broad, generalizable theories, the reliance on creating a narrative out of historical material is also not conducive to explaining political behavior and outcomes. As Runyan’s (1981) study of why the Dutch painter Van Gogh might have cut off his ear demonstrates, psychoanalytical theories are also impossible to falsify, since there can be many possible explanations why someone behaved the way he or she did. Scholars also often do not have direct access to the leaders, which means they have to rely on documents and secondary sources, which can be a problem when trying to create reliable measures (Houghton, 2009).

Personality and Politics

Political psychologists followed the evolution in psychology and no longer focus solely on psychoanalysis but instead investigate different specific components of personality to analyze political behavior. Winter (2003c) defines personality as “an array of capacities or dispositions that may be engaged, primed, or brought forward depending on the demands of the situation and a person’s own ‘executive apparatus’” (p. 12). Winter compares personality to a personal computer with some relatively fixed hardware characteristics and software applications that can be opened or closed by the operator and affect the arousal and weighting of leaders’ goals and preferences, as well as conflicts and confusion among different goals.

Someone’s personality is important because it acts like a filter through which information is processed and interpreted: It affects how someone interprets information from the environment, how he or she will react to the stimuli, his or her persistence and endurance, or how someone manages factors such as stress and emotions.

As the discussion on psychohistory demonstrated, one of the stumbling blocks to studying political leadership has always been that the investigators do not have access to the individuals whom they want to study. The reason for this

is that presidents, prime ministers, and other important foreign policy actors, such as Barack Obama and Vladimir Putin, often do not have time, or are not interested, to complete the necessary psychological tests or clinical interviews, and even if they had the time, they might not want to participate since the results might be politically damaging if made public. Consider, for example, the implications if through direct tests, psychologists discover that a prime minister is clinically depressed. People might start questioning his or her ability to lead, which would likely be career ending.

To resolve the accessibility problem, scholars developed a number of techniques to derive the personality components at a distance. These methods, which are based on existing psychological measures and tests, rely on content analysis of text material, such as speeches and interviews, because word use can not only demonstrate conscious attempts to relay a message but also encompass unconscious factors such as beliefs, motives, and cognitive structures. The validity and reliability of these techniques has been demonstrated through systematic research by, for example, comparing the results to those of expert panels (Winter, 2003a).

Many of these techniques can now be coded automatically, using computer software. For example, Margaret G. Hermann (1980) developed at-a-distance measures of several beliefs and interpersonal styles, such as nationalism, authoritarianism, and self-confidence (which will be discussed further in a following section). Michael Young subsequently created ProfilerPlus, a program that codes the text automatically using word libraries. The source material—the type of text—that is used for each method can differ significantly. In some cases such as leadership trait analysis, the scholars are looking for spontaneous text, like interview responses, while in other cases, they can rely on more scripted material such as speeches. Similar techniques have also been developed to code other frameworks such as the operational code, which will also be discussed later.

Single Personality Variables

The following section focuses on the three different components of personality: (1) motives, (2) cognitions and beliefs, and (3) temperament and interpersonal traits, which are also often labeled *personality traits* (Shafer, 2000). (Winter, 2003c, adds the situational context as a fourth component, but this is less generally accepted.) Each part briefly defines the component, addresses how this aspect of someone’s personality can affect the way a leader behaves, discusses some important measures that are used, and mentions a number of specific findings.

Motives

One group of factors that can influence how someone will behave in the political realm is his or her motives.

These are the different classes of goals toward which people direct their behavior. As Winter (2003b) states, motives influence how leaders construe the leadership role. Motives influence perceptions of opportunity and danger, they affect the accessibility of different styles and skills, and they determine sources of leadership satisfaction, stress, frustration, and vulnerability. For example, two students with equal intelligence and skills can make different decisions based on what drives them. If one of them is motivated because he or she wants to be successful in his or her studies while the other is more interested in being popular among peers, their attitudes toward school are likely to differ significantly. The interpersonally motivated student is more likely to be swayed to go to a party the day before a test while a task-driven student is more likely to stay home to study. As a result, their exam scores will likely differ, despite the two students' equal intelligence.

Motives are not constant; they can change because of external incentives and internal dynamics and can be subject to distortion, deception, and rationalization. Goals can be accomplished, people can be disappointed, and new goals can emerge. Although there are many different motives that can drive people to act in a certain way, studies in political leadership primarily focus on three: (1) need for power, (2) achievement, and (3) affiliating themselves with others. As with many other personality variables, motives are often measured at a distance through content analysis of verbal behavior.

A first important motive is termed *need for power*. Someone who scores high on this variable is concerned about having an impact, control, or influence over another person, group, or the world at large. A high score on need for power does not mean that this individual is necessarily a Hitler, Napoleon, or comparable to any villain in a James Bond movie. Instead, these people can have qualities that can be beneficial as well as negative for their leadership function. According to Winter (2003b), people who score high on need for power tend to be more adept at building alliances with others, and they actively define the situation themselves, encourage people to participate, and try to influence others. During negotiations, they tend to be exploitative and aggressive and tend to rely on political experts for advice, instead of friends. Hermann (1980) found that among 45 world leaders, power-motivated leaders tended to be more independent and confrontational. Winter (1980) also states that power motivation is associated with involving the country in war.

Another motive that can impact political behavior is termed *need for achievement*. This motive refers to a person's concern about achieving excellence (Winter, 2003b). People who score high on this variable tend to be rational calculators, pursuing their self-interest. Although achievement-motivated individuals do well in business, they do not necessarily function well in the political domain. This is because in dealing with a problem, once they have established the best solution, they tend to want to

push this plan through, even if others disagree. In dealing with a financial crisis, for example, some believe that large-scale government intervention is necessary while others believe the market will balance itself. In such conditions, an achievement-oriented leader can alienate part of his or her constituency by pushing forward a divisive program.

The motive termed *need for affiliation* measures to what extent someone is concerned about establishing, maintaining, or restoring friendly relations among persons and groups (Winter, 1991). Leaders who score high on this motive are more focused toward others. Their circle is often small and consists of people whom these leaders agree with and whom they like. These types of leaders tend to be more peaceable and cooperative (Hermann, 1980)—so long as they are surrounded by like-minded others and do not feel threatened. They are also more vulnerable to the influence of self-seeking subordinates and scandal. Nixon, for example, scored high on affiliation as well as achievement (Winter & Carlson, 1988).

Cognitions and Beliefs

A second way in which a leader's personality can influence the decision-making process is through his or her cognitions, beliefs, or both. This includes a wide variety of mental representations, schemas, models, categories, beliefs, values, and attitudes (Winter, 2003a). This category analyzes ways in which individuals view various friendly and hostile groups, different social systems, and themselves. It also encompasses how these leaders interpret, structure, and retrieve information, as well as leaders' general beliefs about the nature of politics and the world in general. Cognitions and beliefs can play a very important role because they determine how information is processed and which information is selected. For example, someone who is convinced that the world is an evil place where everybody is out to get him or her is more likely to accept information that supports this worldview than someone who believes the international realm is more peaceful and cooperative. Beliefs tend to be fairly fixed but can be affected by persuasion. An individual who grew up fearing the Soviet Union because of the cold war is very unlikely to quickly change his or her opinion about Russia and its people. He or she can, however, change beliefs by, for example, moving to Russia or having to work with a lot of Russians on a daily basis.

One of the most studied cognitive features is conceptual complexity. Do leaders process information in simplistic ways, or do they recognize different points of view? Do they view the world in black and white alternatives, or are they able to recognize many different shades of gray? Conceptual complexity can be treated as a stable personality trait. This characteristic can lead to leadership success, affecting, for example, the length of tenure in high office and can reduce stress during crises (Wallace & Suedfeld, 1988). Bill Clinton, for example, scores fairly

high on conceptual complexity compared to other world leaders (Hermann, 2003b).

Studies have also examined how the context might influence complexity or how people with different levels of complexity react to different conditions (Suedfeld, Guttieri, & Tetlock, 2003). Suedfeld, Tetlock, and Streufert (1992) refer to this interaction as integrative complexity. High scores on integrative complexity were found to be related to peaceful resolution (versus escalation) of international conflict (Tetlock, 1977). It does not mean, however, that high complexity leads to better decisions. Chamberlain, who was comparatively complex during the Munich Conference, was outmaneuvered by Hitler in spite of the latter's low level of complexity (Suedfeld et al., 2003).

An important tool for measuring a leader's beliefs is the operational code (George, 1969). This is a set of philosophical beliefs about the nature of political life (harmony or conflict), the predictability and controllability of political outcomes, and instrumental beliefs about the best way to pursue goals and calculate risks. These beliefs function as guides to political decision making, especially under conditions of relative uncertainty about the consequences of choosing one course of action rather than another (Walker, 1990). These beliefs vary in degree over time and for different issue areas (Walker, Shafer, & Young, 2003). Renshon (2008), for example, demonstrated with his analysis of President George W. Bush that role changes and traumatic events caused major shifts in his beliefs. This technique is particularly useful for gaining an understanding of new actors about whom we know little, as was the case when Vladimir Putin replaced Boris Yeltsin as Russian president. Walker, Schafer, and Young (1998) have developed objective quantitative methods for assessing operational codes based on the verbs in context approach.

A number of other beliefs and interpersonal style variables have also been studied that can affect how leaders act in the political realm. Hermann (1980), for example, developed at-a-distance methods to measure level of nationalism, distrust of others, belief that one can control events, and self-confidence. Hermann found that distrust and nationalism were linked to expressions of strong negative affect toward other countries and with low levels of resource commitment in foreign relations. She also found that leaders with high levels of self-confidence are more immune to incoming information and feel less compelled to adapt to the nature of the situation.

Traits

A third aspect of a person's personality is a leader's traits. Although many psychologists use the term *trait* to refer to all personality variables, others define this term as the public, observable elements of personality. Without necessarily knowing someone's beliefs, motivations, or intellectual capacities, it is possible to make some statements about an individual, purely based on what one sees. In the popular TV series *Friends*, for example, the

character Rachel Green, played by Jennifer Aniston, can be described as being self-absorbed, outgoing, and image conscious, while Monica Geller, played by Courteney Cox Arquette, is obsessive, competitive, and neurotic. Scholars mostly agree that there are five big traits that are considered fundamental and are therefore most frequently used by political psychologists. They are (1) extraversion or surgency, (2) agreeableness, (3) conscientiousness, (4) emotional stability or neuroticism, and (5) openness to experiences (Winter, 2003a). Although most concur that these are the five most salient traits, there is considerable discussion as to the content and structure of each factor.

These variables are often coded by asking historians, or other individuals that have studied the leader, to fill in questionnaires that probe for the various traits, using, for example, adjective check lists or by content analyzing descriptions of leaders by other policymakers. Traits resembling extraversion and openness have been linked to a variety of measures of presidential performance (Simenton, 1988), and other studies found a correlation between openness and greatness (Rubenzer, Faschingbauer, & Ones, 2000).

Multivariate Approaches

The previous section treated the three major categories of personality—motives, cognitions, and traits—separately, focusing on how these different components can impact a leader's decision. Very often, however, behavior is not determined by one sole factor but is instead an interaction between different parts of someone's personality. Motives might drive you to do something, but how you interpret the situation determines whether you even observe that there is a problem or not. Some studies have attempted to combine different personality aspects to examine political behavior.

One attempt to combine the various personality dimensions is Hermann's (1987) Leadership Trait Analysis (LTA). This approach combines seven personality traits to create an overall leadership profile. These are conceptual complexity, belief that the leader can control events, self-confidence, need for power, task focus, distrust of others, and in-group bias. Combinations of these variables are then used to answer three questions: Is the leader open or closed to information, is he or she task or relationship focused, and will the individual respect or challenge constraints? How the leader scores on these questions then determines which of eight leadership styles a leader has: expansionistic, evangelistic, actively independent, directive, incremental, influential, opportunistic, or collegial. Bill Clinton, for example, is considered to be a collegial leader: He generally respects constraints, is open to information, and is motivated by both solving the problem and keeping morale high (Hermann, 2003b).

Hermann and Preston (1994) have also linked leadership style to the way in which U.S. presidents organize their advisory systems: whether it is formalistic, competitive,

or collegial. Kille (2006) also combined different LTA variables to determine how secretaries general of the United Nations will approach their positions. He demonstrates that whether the leader is a manager, a strategist, or a visionary will determine how the individual will use his or her agenda-setting power, resolve disputes, and approach possible UN interventions.

Future Directions

So far, studies in political leadership have been very successful in determining that leadership matters (Hermann & Hagan, 1998). Research has found a number of aspects of an individual's personality that can determine politically important behaviors such as the selection of advisors, the processing of advice, risk-taking propensity, and negotiating styles. Research has also found a relationship between some personality aspects and broad foreign policy outcomes such as going to war. Still, leadership as an independent variable in international relations will always be limited in what it can explain since it will always to some extent be influenced by the environment. A leader can be very war prone and can push his or her country toward attacking another nation. Nevertheless, this does not mean that violence will necessarily occur, since other countries might intervene, or domestic factors such as other institutions or popular outcries might still force the leader to change his or her mind. Leadership can thus never by itself fully predict exact situations (Winter, 2003c).

The study of political leadership is a constantly evolving field. Next to working on making the current variables more reliable and valid, scholars are also examining how the different components that have been established might relate to each other and how they might interact in systematic ways. Researchers are also constantly expanding into new areas. They are investigating new personality components such as creativity and impulsivity. The literature is also gradually expanding into examining how emotions such as anxiety and anger influence decision making (Post, 2003a).

Next to finding new and improved measures of personality components, the literature also needs to examine new areas in which leadership can have a significant independent impact. So far, most of the studies have focused on the most likely cases of leadership or examined individuals where the impact on the political realm would be most obvious, such as presidents, authoritarian leaders, or both, or the studies have focused on situations where leaders were forced to take autonomous decisions such as during international crises. One area in which political leadership has yet to expand significantly is situations where the leadership effect is not as direct. Kille and Scully (2003) and Kille (2006), for example, study the secretaries general of the United Nations and the presidents of the European Commission and look at how their leadership styles can be important, despite not having any true formal power that

comes with their positions. Political leadership can also examine cases where leaders such as presidents and prime ministers can play a role outside the area where they have traditionally held most power. One example is the U.S. president's State of the Union address. Do presidents' motivations and openness to information influence whether these individuals will actively try to set the agenda or be more reactive to pressures from the media and public opinion?

The rapidly advancing and broadly available technology also provides great opportunities to advance the knowledge of political leadership in the near future. Websites such as LexisNexis and the World News Connection, among others, allow scholars easy access to a wide variety of source material such as speeches and interviews. This material is often translated into English and can be accessed within days, hours, or in some cases even minutes of the event. Computer-assisted content analysis techniques also allow scholars to code this material in significantly less time, without endangering validity or reliability. This increased availability of data, as well as the ability to code much faster, present the opportunity to do comparative studies of leadership on a much larger scale. These studies can either rely on a much larger sample of political leaders or look at how the personality factors of an individual evolve across time or in different conditions. For example, it is now feasible for scholars with a limited budget to create leadership profiles of all members of the U.S. Congress or other national or international bodies.

The importance of political leadership is likely to continue in the future, since the instability in the world shows no sign of changing and national and international crises can erupt at any time. Scholars will thus continue to have a plethora of cases and individuals to examine and better material and techniques to accomplish this. These results will then, it is to be hoped, be used not only to advance science but also to help design strategies that will avert disasters and help resolve conflicts on a global level.

BALANCE OF POWER

BRIAN R. KING

Muskingum University

Balance of power is a concept within the realm of international relations that stretches back centuries in both theory and practice and is still among the prevalent topics of debate within contemporary political science. These centuries of historical perspective and scholarship, however, have served only to intensify the debate over the merits of balance of power theory.

There are many ways in which the term *balance of power* has been used in theory or in practice (Claude, 1962; Sheehan, 1996), and this variety of approaches to the concept demonstrates that the term is often used so freely as to potentially confuse rather than clarify its meaning (Sheehan). Despite this diversity, however, nearly all of these definitions center on the same general principles and assumptions and boil down to the central assertion that nation-states will ally with one another in order to create an equality of capabilities between opposing alliances that serves to preserve peace at the international level. Some scholars have attempted to codify the formal assumptions, conditions, and criteria for labeling an arrangement as a balance of power system, and perhaps the best known of these is Kaplan (1957). Based on theoretical modeling, he delineated six assumptions that had to be accepted, then outlined his six fundamental rules for a balance of power system. Although these and other attempts to formalize the process are aspiring to help the field of study and policymakers alike, the problem is that

balance of power systems in practice neither cohere to all of the assumptions nor follow all of the rules set out by any given treatise on the subject. The global environment and the myriad of other variables are not static but rather are fluid in nature and are therefore difficult to prescribe (Claude, 1962).

Some scholarship has focused on the dynamic that exists between the main balance of power system and various local balances that exist as subsets of the main system, including the roles played by dominant and submissive balances within the overall system (Bull, 1977). Though there is no consensus concerning the full extent of the relationship between these smaller balances and the overall arrangement, it is generally agreed that these play an important role in understanding the true dynamic of any balance of power arrangement.

Core Concepts and Dynamics of the Process

Balance of power theory asserts that nation-states, as rational actors in an anarchical international system, will accumulate power in pursuit of national survival and will concurrently strive to make certain that no other actor accumulates sufficient power to threaten their own security. These assertions are firmly rooted in realist assumptions.

Morgenthau (1948, 1978), the father of 20th-century classical realism, contends (among other things) that nation-states are the primary actors on the world stage, that nation-states are rational actors who make rational decisions, and that states relentlessly pursue power and capabilities in order to protect and promote their national interest (i.e., survival). States in the international system possess varying levels of power, and as such, strong states are perceived to be a threat to the security of weaker states. These weak states may thus find it necessary to enlarge their own military capabilities, known as internal balancing. When this is not an option, whether for economic or other reasons, weak states may ally with other actors in the system, known as external balancing, so that their combined power can sufficiently match that of an adversary or an alliance of adversaries, thus creating a balance among competing powers on the international stage that makes aggression much less likely. The security regime that results is an international system of distrust and competition among nation-states, all of whom could potentially be ally or adversary toward one another depending on a state's security needs and the current balance among states and alliances. This dynamic is nothing new but rather has been a constant and recurring reality in international relations so long as there have been independent actors in an anarchical international system.

Balances occur as an outgrowth of the anarchical nature of the system, a fundamental assumption of the realist paradigm. Nation-states, the principal actors in this system, are ultimately unbound by any rulers or regimes above them, since any such organization or agreement would lack sufficient sovereign authority to compel specific state behavior (Waltz, 1979). The primary goal of each state is survival, which is pursued through the accumulation of power. From the realist perspective, power is generally gained by virtue of military capability, while economic capability is important primarily for its ability to gain additional military power. At this point, two additional realist assumptions come into play. First, the pursuit of power can be seen as something of a zero-sum game at the international level, meaning that the acquisition of power by one state comes at the cost of others in the system. In other words, power being a relative concept, gains by another actor will be perceived by potential adversaries as a relative loss for themselves. Second, aggression against weaker states is assumed to be a likely behavior of stronger states pursuing greater power and capability. In fact, Morgenthau (1948) contends that individual states seek superiority, not balance, and that the concurrent competition for superiority between states is what brings the balance itself.

Both of these assumptions being true, it stands to reason that the existence of weakness—and thus imbalance—in the system will lead to aggression on the part of the strong state, thus threatening the security of all actors. To prevent this, weaker states will put aside their own differences and

form an alliance to protect their own security and prevent the stronger state from becoming hegemonic. It is the perceived threat of hegemony that matters. In this light, even traditional allies and states that have no history of conflict will engage in balancing behavior in order to prevent the ascension of a hegemon in the system (Waltz, 2000). Put another way, hegemony actually compels the process by which balance results (Waltz, 1993).

The realist paradigm, dominant in its influence among scholars and policymakers alike in the early days of the cold war, had by the 1960s and 1970s become the target of increasing criticism from those who saw the approach as both theoretically and methodologically flawed. Out of this criticism came Waltz's (1979) *Theory of International Politics*, which redefined the paradigm as structural realism, or neorealism. According to Waltz, the balance of power concept was still the central organizing principle of the anarchical international system. States, in order to survive, are left with little choice other than to emulate those states that have proven successful in international affairs. As such, states will eventually all function and behave in essentially the same fashion, and a balance of power arrangement soon emerges. For such a system to emerge, asserts Waltz, all that is necessary is an anarchical international system and member states that wish to survive. He further explains that with the term *balance* he is referring to the state of the system as a whole and not to any particular subset of states within the system. Thus, there might be a given level of disequilibrium between two or more powers in a given balance arrangement, but other factors (such as the presence of equally balanced superpowers, for example) may be keeping the system itself in equilibrium despite the existence of such discord. Additionally, he argues that states do not need to actively pursue a balance strategy, because it is the natural result of normal relations between states in the international system. This point was argued by earlier scholars such as Claude (1962), who distinguished between “manual” systems where balancing strategy are actively pursued and “semiautomatic” systems where such a strategy is not as consciously or aggressively pursued. Morgenthau (1978) goes even further, asserting essentially that the emergence of equilibrium is an inevitable outcome of international relations.

Polarity and Balance of Power

There are various ways in which capabilities may be divided or distributed in the international system, leading to different forms of balancing between one, two, three, or more major states in the system. The ways in which balances of power are formed make a difference, scholars contend, because some balance arrangements are more stable and more capable of maintaining peace than are others (Snyder, 1997). The difficulty here is that there is disagreement on which balance arrangement brings the greatest

stability. Waltz (1979) contends that stability comes from having the fewest possible great powers competing for power. Thus, a bipolar balance of power would be best. Other research, such as that of Singer, Bremer, and Stuckey (1972), asserts that in the 1800s, the incidence of war actually decreased as the number of great powers increased. This would seem to indicate that a multipolar system is more stable. Although they do concede that the opposite trend was true in the 20th century (most notably during the cold war), it is possible that this can be attributed to other factors such as the emergence of nuclear weapons, not to the innate stability of the bipolar system itself. Since the 1990s, researchers have debated the long-term prospects for peace in a unipolar system, where the dominant power may have primacy but not enjoy true hegemony. History has seen all three systems in play, including the multipolar system during the Concert of Europe, the bipolarity of the cold war, and the current unipolar arrangement that emerged after the Soviet bloc collapsed. These and other examples of each system are discussed later in the chapter.

Bandwagoning and Collective Security as Alternatives to Balancing
